- **Washer Mode** - When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for more than about one-half second with the wiper system turned Off, the washer pump/motor and the wipers will operate for as long as the washer switch is held closed up to about thirty seconds, then the wipe-after-wash mode is invoked when the control knob is released. When the Wash position is selected with the wiper system operating in a continuous wipe mode, washer fluid will be dispensed onto the windshield glass through the washer nozzles for as long as the washer switch is held closed up to about thirty seconds. When the Wash position is selected with the wiper system operating in an intermittent wipe mode, washer fluid is still dispensed until the control knob is released; however, the wipers will operate in a low speed continuous cycle from the time the washer switch is closed until several wipe cycles after the switch is released, before returning to the selected intermittent wipe interval. If the control knob is held in the depressed Wash position for more than about thirty seconds, washer system operation will be suspended until the control knob is released for about two seconds then cycled back to the Wash position.
- **Wipe-After-Wash Mode** - When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for more than about one-half second with the wiper system turned Off, the washer pump/motor and the wipers will operate for as long as the washer switch is held closed up to about thirty seconds, then provide several additional wipe cycles after the control knob

is released before parking the wiper blades near the base of the windshield. If the control knob is held in the depressed Wash position for more than about thirty seconds, washer system operation will be suspended until the control knob is released for about two seconds then cycled back to the Wash position.

OPERATION

The wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outside windshield glass surface that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all wiper and washer system functions with the control knob on the end of the control stalk of the multi-function switch that extends from the left side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the Off, Delay, Low, or High wiper system operating modes. In the Delay mode, the control knob also allows the vehicle operator to select from one of five intermittent wipe Delay intervals. Depressing the control knob towards the steering column actuates the momentary washer system switch, which selects the Wash, Wipe-After-Wash, and Pulse Wipe Modes depending upon when and how long the switch is held closed. The multi-function switch provides hard wired resistor multiplexed inputs to the instrument cluster for all of the wiper and washer system functions. The instrument cluster then sends electronic messages to the Front Control Module (FCM) over the Programmable Communications Interface (PCI) data bus requesting the appropriate wiper and washer system operating modes.

Wiper and washer system operation are completely controlled by the instrument cluster and FCM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the Accessory or On positions. Battery current is directed from a B(+) fuse in the Integrated Power Module (IPM) to the wiper on/off relay and the wiper high/low relay in the IPM through a fused B(+) circuit. The FCM uses low side drivers to control wiper system operation by energizing or de-energizing the wiper high/low and wiper on/off relays. The FCM uses a high side driver to control the operation of the washer pump motor unit. The multi-function switch circuitry receives a clean ground output from the instrument cluster on a multi-function switch return circuit, then provides resistor multiplexed inputs to the instrument cluster on an intermittent wipe mux circuit to indicate the selected wiper system mode and on a wash/beam select mux circuit to indicate the selected washer system mode.

The hard wired circuits and components of the wiper and washer system may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the instrument cluster, the FCM, or the electronic message inputs to or outputs from the instrument cluster or FCM that control the wiper and washer system operating modes. The most reliable, efficient, and accurate means to diagnose the instrument cluster or the FCM inputs and outputs related to the various wiper and washer system operating modes requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the wiper and washer system operating modes.

CONTINUOUS WIPE MODE

When the Low position of the control knob on the control stalk of the multi-function switch is selected the instrument cluster sends an electronic wiper switch low message to the FCM, then the FCM energizes the wiper on/off relay. This directs battery current through the normally open contacts of the energized wiper on/off relay and the normally closed contacts of the de-energized wiper high/low relay to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the High position of the control knob is selected the instrument cluster sends an electronic wiper switch high message to the FCM, then the FCM energizes both the wiper on/off relay and the wiper high/low relay. This directs battery current through the normally open contacts of the energized wiper on/off relay and the normally open contacts of the energized wiper high/low relay to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the Off position of the multi-function switch control knob is selected, the instrument cluster sends an electronic wiper switch off message to the FCM. If

the wiper motor was operating at high speed, the FCM immediately de-energizes the wiper high/low relay causing the wiper motor to return to low speed operation. Then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob Off position is selected.

If the wiper blades are in the down position on the windshield when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground and provides a hard wired park switch sense input to the FCM. The FCM then de-energizes the wiper on/off relay and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is an open circuit and the FCM keeps the wiper on/off relay energized, which causes the wiper motor to continue running at low speed until the wiper blades are in the down position on the windshield and the park switch input to the FCM is again closed to ground.

INTERMITTENT WIPE MODE

When the control knob on the control stalk of the multi-function switch is moved to one of the Delay interval positions the instrument cluster sends an electronic wiper switch delay message to the FCM, then the FCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input. The FCM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the FCM to determine the proper intervals at which to energize and de-energize the wiper on/off relay to operate the wiper motor intermittently for one low speed cycle at a time.

The FCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature the FCM monitors electronic vehicle speed messages from the Powertrain Control Module (PCM) and doubles the selected delay interval whenever the vehicle speed is about sixteen kilometers-per-hour (ten miles-per-hour) or less.

PULSE WIPE MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for less than about one-half second, the instrument cluster sends an electronic washer switch message to the FCM, then the FCM the energizes the wiper on/off relay for one complete wipe cycle. The FCM de-energizes the relay when the state of the park switch sense changes to ground, parking the wiper blades near the base of the windshield.

WASH MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for more than about one-half second, the instrument cluster sends an electronic washer switch message to the FCM, then the FCM directs battery current to the washer pump/motor unit. This will cause the washer pump/motor unit to be energized for as long as the Wash switch is held closed up to about thirty seconds, and to de-energize when the front Wash switch is released.

When the control knob is depressed to the momentary Wash position while the wiper system is operating in one of the Delay interval positions, the washer pump/motor operation is the same. However, the FCM also energizes the wiper on/off relay to override the selected delay interval and operate the wiper motor in a continuous low speed mode for as long as the control knob is held depressed, then de-energizes the relay and reverts to the selected delay mode interval several wipe cycles after the control knob is released. If the control knob is held depressed for more than about thirty seconds, the FCM will suspend washer pump/motor operation until the knob is released for about two seconds, then cycled back to the Wash position.

WIPE-AFTER-WASH MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for more than about one-half second while the wiper system is not operating, the instrument cluster sends an electronic washer switch message to the FCM, then the FCM the directs battery current to the washer pump/motor unit and energizes the wiper on/off relay. This will cause the washer pump/motor unit to be energized and operate the wiper motor in a continuous low speed mode for as long as the Wash switch is held closed up to about thirty seconds. When the control knob is released, the FCM de-energizes the washer pump/motor unit, but allows the wiper motor to operate for several additional wipe cycles before it de-energizes the wiper on/off relay and parks the wiper blades near the base of the windshield.

If the control knob is held depressed for more than about thirty seconds, the FCM will suspend washer pump/motor operation until the knob is released for about two seconds, then cycled back to the Wash position; however, the wipers will continue to operate for as long as the Wash switch is held closed. The FCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the FCM to count the number of wipe cycles that occur after the Wash switch is released, and to determine the proper

interval at which to de-energize the wiper on/off relay to complete the wipe-after-wash mode cycle.

DIAGNOSIS AND TESTING - WIPER & WASHER SYSTEM

If the wiper motor operates, but the wipers do not move on the windshield, replace the faulty wiper module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper and washer system components as required. (Refer to 8 - ELECTRICAL/ WIPERS/WASHERS - CLEANING) and (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSPECTION). For diagnosis and testing of the multi-function switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The hard wired circuits and components of the wiper and washer system may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the instrument cluster, the Front Control Module (FCM), or the electronic message inputs to or outputs from the instrument cluster and the FCM that control the various wiper and washer system operating modes. The most reliable, efficient, and accurate means to diagnose the instrument cluster, the FCM, or the electronic message inputs and outputs related to the various wiper and washer system operating modes requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

WARNING: TO AVOID PERSONAL INJURY OR DEATH, ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, AIRBAG, SEAT BELT TENSIONER, IMPACT SENSOR, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT.

CLEANING - WIPER & WASHER SYSTEM

WIPER SYSTEM

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

WASHER SYSTEM

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump/motor inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

WIPERS/WASHERS (Continued)

INSPECTION - WIPER & WASHER SYSTEM

WIPER SYSTEM

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

(1) Inspect the wiper arms for any indications of damage, or contamination. If the wiper arms are contaminated with any foreign material, clean them as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). If a wiper arm is damaged or corrosion is evident, replace the wiper arm with a new unit. Do not attempt to repair a wiper arm that is damaged or corroded.

(2) Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

(3) Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.

(4) Inspect the wiper blades and squeegees for any indications of damage, contamination, or rubber deterioration (Fig. 2). If the wiper blades or squeegees are contaminated with any foreign material, clean them and the glass as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). After cleaning the wiper blade and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade. Also, if a wiper blade is damaged or the squeegee rubber is damaged or deteriorated, replace the wiper blade with a new unit. Do not attempt to repair a wiper blade that is damaged.

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

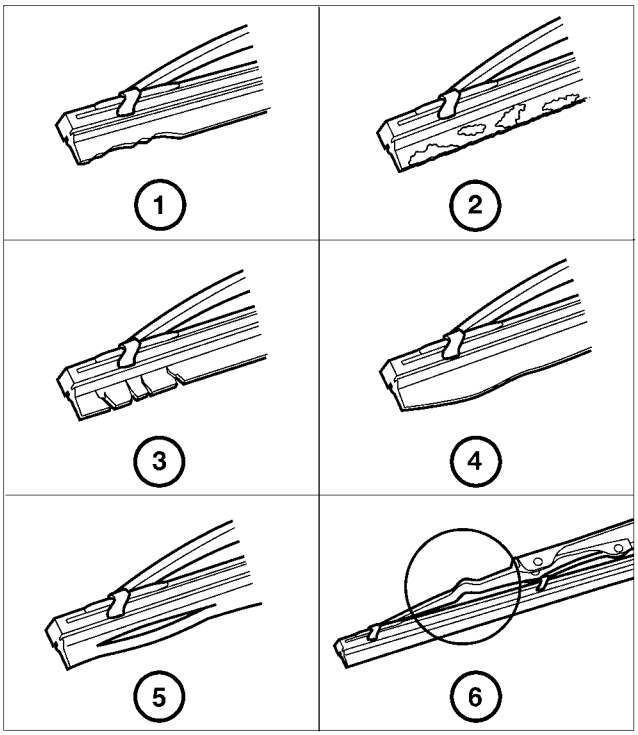

Fig. 2 Wiper Blade Inspection

1 - WORN OR UNEVEN EDGES
2 - ROAD FILM OR FOREIGN MATERIAL DEPOSITS
3 - HARD, BRITTLE, OR CRACKED
4 - DEFORMED OR FATIGUED
5 - SPLIT
6 - DAMAGED SUPPORT COMPONENTS

(1) Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING).

(2) Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

CHECK VALVE

DESCRIPTION

A single washer system check valve is standard equipment on this model, and is installed in the

CHECK VALVE (Continued)

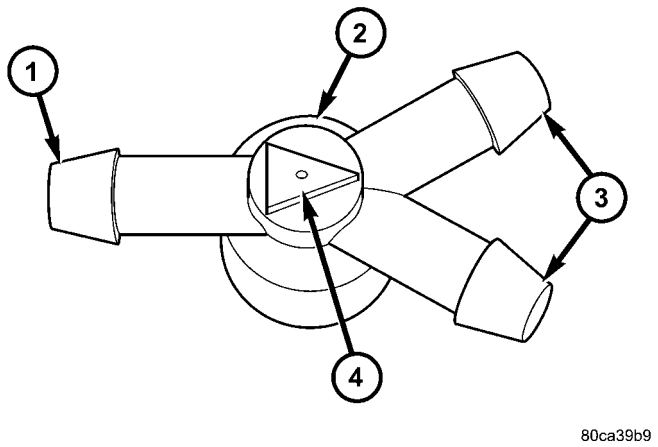

Fig. 3 Check Valve

1 - INLET NIPPLE
2 - CHECK VALVE
3 - OUTLET NIPPLE (2)
4 - FLOW DIRECTION ARROW

washer system plumbing (Fig. 3). The check valve is integral to the washer nozzle plumbing wye fitting located in the cowl plenum area beneath the cowl plenum cover/grille panel near the base of the windshield. The check valve consists of a molded plastic body with a raised arrowhead molded into its center section that indicates the direction of the flow through the valve, and three barbed hose nipples formed in a wye configuration on the outside circumference of the center section of the valve body. The check valve cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The check valve provides more than one function in this application. It serves as a wye connector fitting between the engine compartment and washer nozzle sections of the washer supply hose. It prevents washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay from when the washer switch is actuated until washer fluid was dispensed through the washer nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer system is turned Off.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the valve by overriding the spring pressure applied to it by a piston (Fig. 4). With the diaphragm unseated, washer fluid is allowed to flow toward the two washer nozzles. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the valve and fluid flow in either direction within the washer plumbing is prevented. The check valve cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

5 - FROM WASHER PUMP

REMOVAL

(1) Remove both wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARM - REMOVAL).

(2) Unlatch and open the hood.

(3) Remove the cowl plenum cover/grille panel from over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(4) From the underside of the cowl plenum cover/grille panel, disconnect the cowl plenum and washer nozzle hoses from the three barbed nipples of the check valve (Fig. 5).

(5) Remove the check valve from the underside of the cowl plenum cover/grille panel.

INSTALLATION

(1) Position the check valve to the underside of the cowl plenum cover/grille panel (Fig. 5). Be certain that the flow direction arrow molded into the check valve body is oriented towards the washer nozzles.

6 - WASHER NOZZLE HOSE (LEFT)

(2) From the underside of the cowl plenum cover/grille panel, reconnect the cowl plenum and washer nozzle hoses to the three barbed nipples of the check valve.

(3) Reinstall the cowl plenum cover/grille panel over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(4) Close and latch the hood.

(5) Reinstall both wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARM - INSTALLATION).

WASHER FLUID LEVEL SWITCH

DESCRIPTION

The washer fluid level switch is a single pole, single throw reed-type switch mounted on the outboard side of the of the washer reservoir in the engine compartment (Fig. 6). Only the molded plastic switch mounting flange and the integral connector receptacle are visible when the switch is installed in the reservoir. A short nipple formation extends from the inner surface of the switch mounting flange, and a barb on the nipple near the switch mounting flange is pressed through a rubber grommet seal installed in the mounting hole of the reservoir.

A small, molded plastic float has two pivot pins near its center that are snapped into two receptacles near the ends of two stanchions that extend toward the float from the switch nipple formation. A small magnet is secured within the end of the float nearest

4 - RESERVOIR
5 - GROMMET SEAL
6 - PIVOT
7 - MAGNET
8 - CONNECTOR RECEPTACLE

the switch nipple formation, and a reed switch is concealed within the nipple. A diagnostic resistor is connected between the two switch terminals within the switch mounting flange. The washer fluid level switch cannot be adjusted or repaired. If faulty or damaged, the switch must be replaced.

OPERATION

The washer fluid level switch uses a pivoting, oblong float to monitor the level of the washer fluid in the washer reservoir. The float contains a small magnet. When the float pivots, the proximity of this magnet to a stationary reed switch within the nipple formation of the switch changes. When the fluid level in the washer reservoir is at or above the float level, the float moves to a vertical position, the influence of the float magnetic field is removed from the reed switch, and the normally open reed switch contacts open. When the fluid level in the washer reservoir falls below the level of the pivoting float, the float moves to a horizontal position, the influence of the float magnetic field is applied to the reed switch, and the contacts of the normally open reed switch close.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the right (except diesel engines) or left (diesel engines only) headlamp and dash wire harness. The switch is connected in series between a clean ground output of the Front Control Module

WASHER FLUID LEVEL SWITCH (Continued)

(FCM) on a sensor return circuit and the washer fluid switch sense input to the FCM. When the switch closes, the FCM senses the ground on the washer fluid switch sense circuit. The FCM is programmed to respond to this input by sending an electronic washer fluid indicator lamp-on message to the instrument cluster over the Programmable Communications Interface (PCI) data bus. The instrument cluster responds to this message by illuminating the washer fluid indicator and by sounding an audible chime tone warning.

The washer fluid level switch may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the instrument cluster, the FCM, or the electronic message inputs to or outputs from the instrument cluster and the FCM that control the operation of the washer fluid visual and/or audible indicators. The most reliable, efficient, and accurate means to diagnose the washer fluid level indicator, the instrument cluster, the FCM, or the electronic message inputs and outputs related to the washer fluid indicator requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.

(1) Unlatch and open the hood.

(2) Disconnect and isolate the battery negative cable.

(3) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor unit and allow the washer fluid to drain into a clean container for reuse.

(4) Disconnect the right (except diesel engine) or left (diesel engine only) headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle (Fig. 7) or (Fig. 8).

NOTE: The pivoting float of the washer fluid level switch must be in a horizontal position within the reservoir in order to be removed. With the reservoir empty and in an upright position, the pivoting float will orient itself to the horizontal position when the switch connector receptacle is pointed straight upwards.

(5) Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal on the reservoir sump. Care must be taken not to damage the reservoir.

(6) Remove the washer fluid level switch from the washer reservoir.

(7) Remove the rubber grommet seal from the washer fluid level switch mounting hole in the washer reservoir and discard.

WASHER FLUID LEVEL SWITCH (Continued)

INSTALLATION

(1) Install a new rubber grommet seal into the washer fluid level switch mounting hole in the washer reservoir. Always use a new rubber grommet seal on the reservoir.

(2) Insert the float of the washer fluid level switch through the rubber grommet seal and into the washer reservoir. The connector receptacle of the washer fluid level switch should be pointed upward.

(3) Using hand pressure, press firmly and evenly on the washer fluid level switch mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.

(4) Reconnect the right (except diesel engine) or left (diesel engine only) headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle (Fig. 7) or (Fig. 8).

(5) Reconnect the removed washer hose to the barbed outlet nipple of the washer pump/motor unit.

(6) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(7) Reconnect the battery negative cable.

(8) Close and latch the hood.

WASHER HOSES/TUBES

DESCRIPTION

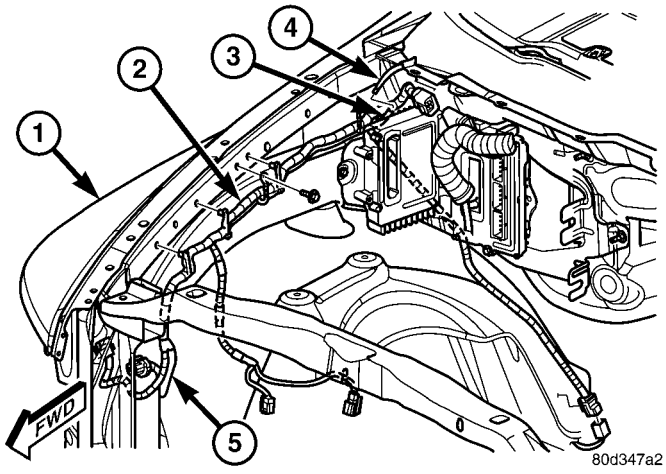

Fig. 9 Engine Compartment Washer Hose

1 - RIGHT FENDER
2 - RIGHT HEADLAMP & DASH WIRE HARNESS
3 - ENGINE COMPARTMENT WASHER HOSE (TO COWL PLENUM)
4 - COWL PLENUM WASHER HOSE
5 - ENGINE COMPARTMENT WASHER HOSE (TO WASHER RESERVOIR)

The washer plumbing consists of a small diameter rubber reservoir washer hose that is routed from the barbed outlet nipple of the electric washer pump/motor unit on the washer reservoir through a trough molded into the back of the reservoir above the washer pump and to the engine compartment washer hose (Fig. 9). On models equipped with an optional diesel engine, the reservoir washer hose is routed through routing clips on the top of the radiator fan shroud from the washer reservoir on the left side of the radiator to the engine compartment washer hose on the right side of the radiator. The engine compartment washer hose is contained within the right headlamp and dash wire harness, which is routed through the engine compartment along the top of the right front fender wheel house to the dash panel.

The engine compartment washer hose is connected to the washer reservoir washer hose and to the cowl plenum washer hose with molded plastic in-line fittings that have a barbed nipple on each end. The cowl plenum washer hose is routed from the engine compartment into the cowl plenum area through a trough formation located near the right end of the cowl plenum cover/grille panel. The cowl plenum washer hose is connected to the washer system check valve/wye fitting on the underside of the cowl plenum cover/grille panel. The cowl plenum washer hose and the two washer nozzle hoses are routed through integral routing clips on the underside of the cowl plenum cover/grille panel. The cowl plenum washer hose is connected to one nipple on the wye fitting and the two washer nozzle hoses are connected to the other two wye fitting nipples. The washer nozzle hoses are then routed along the underside of the cowl plenum cover/grille panel to the two washer nozzles.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings cannot be repaired. If these fittings are faulty or damaged, they must be replaced.

OPERATION

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the washer system plumbing and fittings to the two washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

WASHER NOZZLE

DESCRIPTION

The two washer nozzles have integral snap features and an anti-rotation tab that secure them in dedicated holes in the cowl plenum cover/grille panel located near the base of the windshield (Fig. 10). The

WASHER NOZZLE (Continued)

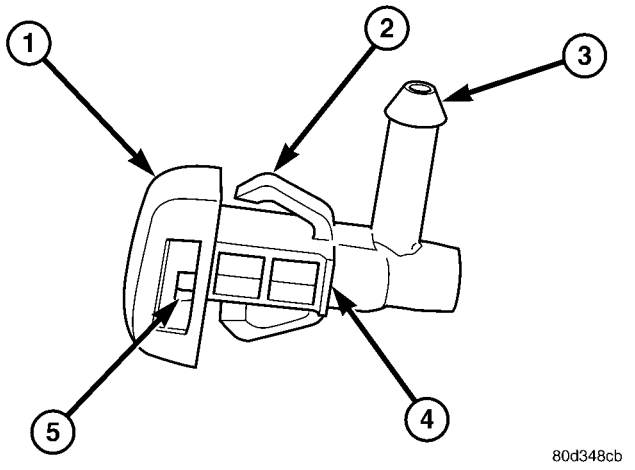

Fig. 10 Washer Nozzle

2 - LATCH (2)
3 - NIPPLE
4 - ANTI-ROTATION TAB
5 - ORIFICE

domed upper surface of the washer nozzle is visible on the top of the plenum cover/grille panel, and the nozzle orifice is oriented towards the windshield glass. The washer plumbing fittings for the washer nozzles are concealed beneath the cowl plenum cover/grille panel. These fluidic washer nozzles are constructed of molded plastic. The cowl plenum cover/grille panel must be removed from the vehicle to access the nozzles for service. The washer nozzles cannot be adjusted or repaired. If faulty or damaged, they must be replaced.

OPERATION

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single hose, which is attached to a barbed nipple on each washer nozzle below the cowl plenum cover/grille panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

REMOVAL

(1) Remove both wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARM - REMOVAL).

(2) Unlatch and open the hood.

(3) Remove the cowl plenum cover/grille panel from over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(4) From the underside of the cowl plenum cover/grille panel, disconnect the washer nozzle hose from the barbed nipple of the washer nozzle (Fig. 11).

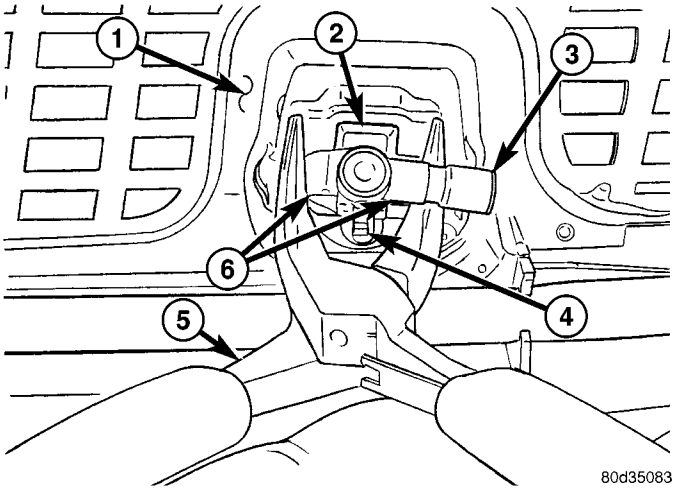

Fig. 11 Washer Nozzle Remove/Install

2 - ANTI-ROTATION TAB (LARGE)
3 - NIPPLE
4 - ANTI-ROTATION TAB (SMALL)
5 - PLIERS
6 - LATCH (2)

(5) From the underside of the cowl plenum cover/grille panel, release the integral snap features of the washer nozzle and push the nozzle out through the mounting hole toward the top side of the cowl plenum cover/grille panel.

(6) Remove the washer nozzle from the top of the cowl plenum cover/grille panel.

INSTALLATION

(1) From the top of the cowl plenum cover/grille panel, position the nipple end of the washer nozzle through the mounting hole and engage the anti-rotation tab of the nipple into the anti-rotation notch in the mounting hole.

(2) Using hand pressure, push firmly and evenly on the top of the washer nozzle until the integral snap features lock into place on the underside of the cowl plenum cover/grille panel.

(3) From the underside of the cowl plenum cover/grille panel, reconnect the washer hose to the barbed nipple of the washer nozzle (Fig. 11).

(4) Reinstall the washer hose for the washer nozzle into its routing clips on the underside of the cowl plenum cover/grille panel.

(5) Reinstall the cowl plenum cover/grille panel over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(6) Close and latch the hood.

WASHER NOZZLE (Continued)

(7) Reinstall both wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARM - INSTALLATION).

WASHER PUMP/MOTOR

DESCRIPTION

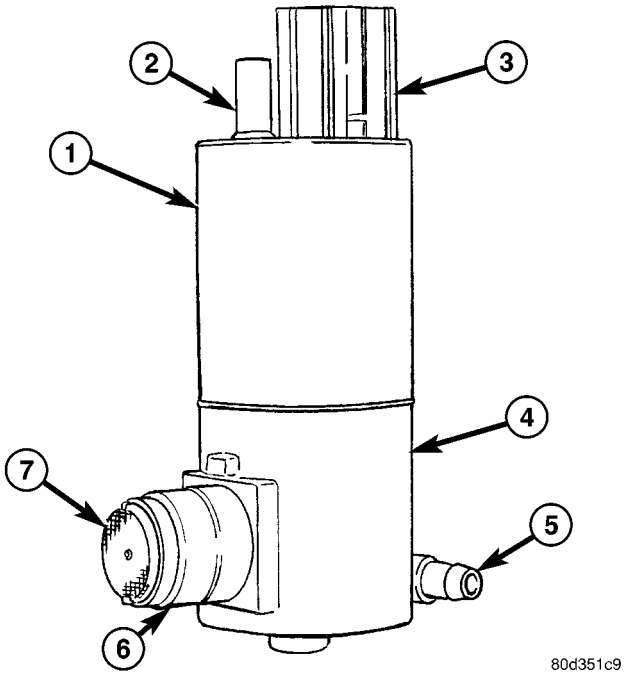

Fig. 12 Washer Pump/Motor

1 - MOTOR
2 - SNAP POST
3 - CONNECTOR RECEPTACLE
4 - PUMP
5 - OUTLET NIPPLE
6 - INLET NIPPLE
7 - FILTER SCREEN

The washer pump/motor unit (Fig. 12) is located on the rearward facing surface of the washer reservoir, in the right (except diesel engine) or left (diesel engine only) front corner of the engine compartment. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump. A seal flange with a barbed inlet nipple on the pump housing passes through a rubber grommet seal installed in a dedicated mounting hole of the washer reservoir. When the pump is installed in the reservoir a barbed outlet nipple on the pump housing connects the unit to the washer system through a short washer reservoir hose.

The washer pump/motor unit is retained on the reservoir by the interference fit between the barbed pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by the use of a snap post on the motor housing and a snap post receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle on the top of the motor housing connects the unit to the vehicle electrical system. The washer pump/motor unit cannot be repaired. If faulty or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

The washer pump/motor unit features a small Direct Current (DC) electric motor. The motor is connected to the vehicle electrical system through a single take out and two-cavity connector of the right (except diesel engine) or left (diesel engine only) headlamp and dash wire harness. The motor is grounded at all times through another take out of the right (except diesel engine) or left (diesel engine only) headlamp and dash wire harness. On models without the diesel engine, a single eyelet terminal connector is secured by a nut to a ground stud located on the right front fender inner shield in the engine compartment. On models with a diesel engine, an eyelet terminal connector is secured by a ground screw to the left front fender inner shield in the engine compartment. The motor receives battery current on a washer pump/motor control circuit.

The washer pump/motor control circuit is energized through a high side driver within the Front Control Module (FCM) whenever the FCM receives an electronic message requesting washer system operation from the instrument cluster over the Programmable Communications Interface (PCI) data bus. The instrument cluster monitors a resistor multiplexed hard wired input from the momentary washer switch contacts within the multi-function switch on the steering column to determine when it should issue the electronic message requesting washer system operation.

Washer fluid is gravity-fed from the washer reservoir to the inlet side of the washer pump. When the pump motor is energized, the motor spins the rotor within the washer pump. The spinning pump rotor pressurizes the washer fluid and forces it through the pump outlet nipple, the washer plumbing, and the washer nozzles onto the windshield glass.

The washer pump/motor unit may be diagnosed using conventional diagnostic tools and methods. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the instrument cluster, the FCM, or the electronic message inputs to or outputs from the instrument cluster and the FCM that control the operation of the washer pump/motor unit. The most reliable, efficient, and accurate means to diagnose the washer pump/motor unit, the instrument cluster, the FCM, or the electronic message

WASHER PUMP/MOTOR (Continued)

inputs and outputs related to the washer pump/motor unit operation requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

The washer pump/motor unit can be removed from the washer reservoir without removing the reservoir from the vehicle.

(1) Unlatch and open the hood.

(2) Disconnect and isolate the battery negative cable.

(3) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor unit and allow the washer fluid to drain into a clean container for reuse.

(4) Disconnect the right (except diesel engine) or left (diesel engine only) headlamp and dash wire harness connector for the washer pump/motor unit from the motor connector receptacle (Fig. 13).

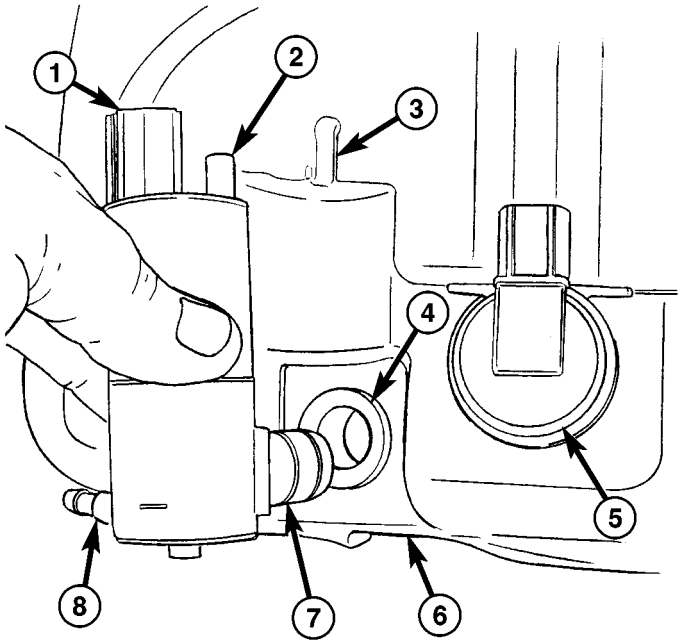

Fig. 13 Washer Pump/Motor Remove/Install

2 - SNAP POST
3 - SNAP POST RECEPTACLE
4 - GROMMET SEAL
5 - WASHER FLUID LEVEL SWITCH
6 - WASHER RESERVOIR
7 - INLET NIPPLE
8 - OUTLET NIPPLE

(5) Firmly grasp the top of the washer pump/motor housing.

(6) Pull lightly outward on the top of the washer pump/motor housing away from the washer reservoir far enough to disengage the snap post on the top of the motor from the receptacle in the reservoir.

(7) Pull the washer pump/motor unit straight out from the washer reservoir far enough to disengage the barbed pump inlet nipple from the rubber grommet seal in the reservoir.

(8) Disconnect the reservoir washer hose from the washer pump/motor unit outlet nipple.

(9) Remove washer pump/motor unit from the back of the washer reservoir.

(10) Remove the rubber grommet seal from the washer reservoir and discard.

INSTALLATION

(1) Install a new rubber grommet seal into the washer pump mounting hole in the washer reservoir. Always use a new rubber grommet seal on the reservoir.

(2) Position the barbed inlet nipple of the washer pump to the rubber grommet seal in the washer reservoir (Fig. 13).

(3) Using hand pressure, press on the washer pump/motor unit firmly and evenly until the barbed inlet nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.

(4) Align the washer pump/motor snap post on the top of the motor housing with the snap post receptacle in the washer reservoir.

(5) Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the snap post snaps into the washer reservoir receptacle.

(6) Reconnect the washer reservoir hose to the barbed outlet nipple of the washer pump.

(7) Reconnect the right (except diesel engine) or left (diesel engine only) headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle.

(8) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(9) Reconnect the battery negative cable.

(10) Close and latch the hood.

WASHER RESERVOIR

DESCRIPTION

Except on models equipped with an optional diesel engine, the molded plastic washer fluid reservoir is mounted on the right rearward facing surface of the cooling module radiator shroud in the engine compartment (Fig. 14). On models with the diesel engine, the molded plastic washer fluid reservoir is mounted on the rearward facing surface of the left vertical member of the radiator support in the engine compartment. The reservoir is a molded unit constructed of a translucent plastic that allows the washer fluid level to be inspected without removing the washer

WASHER RESERVOIR (Continued)

10 - BOTTOM TAB (2)

reservoir cap. The most visible component of the washer reservoir is the filler cap unit, which is secured to and hinges on a hook feature that is integral to the filler neck near the top of the reservoir. The bright yellow plastic filler cap snaps over the filler neck opening and seals the reservoir opening with an integral rubber gasket. The filler cap is labeled with an International Control and Display Symbol icon for “Windshield Washer” and the text “Washer Fluid Only” that are molded into it and highlighted in black against the yellow plastic cap for visibility.

There are dedicated holes near the bottom of the rearward facing side of the reservoir provided for the mounting of the washer pump/motor unit and the washer fluid level switch. A snap post receptacle molded into the reservoir allows for mounting of the washer pump without the use of fasteners. The reservoir also features an integral hose routing trough on its rearward facing side. Except on models with a diesel engine, the washer reservoir is secured to the cooling module radiator shroud with three integral tabs, two at the bottom and one at the top. The two bottom tabs are inserted into two slots near the bottom of the shroud, while the upper tab slides into an integral channel-like slot near the top of the shroud. A molded lock feature on the forward facing surface of the reservoir engages a molded depression on the rearward facing surface of the radiator shroud when the reservoir is fully seated on the shroud, locking the unit securely in place. On models with a diesel engine, the washer reservoir is secured with two screws through integral mounting tabs to the left vertical member of the radiator support. On many models, a molded plastic coolant recovery container or a coolant pressure container must be detached from the top of the cooling module and moved aside to access the washer fluid reservoir for service. This may be accomplished without opening or draining the engine cooling system.

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the washer system. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir. The washer/pump motor unit is located in a sump area near the bottom of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer pump/motor unit is mounted in the lowest position in the sump. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, well before the washer system will no longer operate.

REMOVAL

REMOVAL - EXCEPT DIESEL ENGINE

(1) Unlatch and open the hood.

(2) Disconnect and isolate the battery negative cable.

(3) Remove the fasteners securing the coolant recovery container or the coolant pressure container to the top of the cooling module and move the container aside. It is not necessary to open or drain the engine cooling system. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL) or (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESSURE CONTAINER - REMOVAL).

(4) Disconnect the reservoir washer hose from the barbed nipple of the inline fitting at the engine compartment washer hose in the right headlamp and dash wire harness and allow the washer fluid to

WASHER RESERVOIR (Continued)

drain from the reservoir into a clean container for reuse (Fig. 15).

(5) Disconnect the right headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle.

(6) Disconnect the right headlamp and dash wire harness connector for the washer pump/motor unit from the motor connector receptacle.

(7) Grasp the bottom of the washer reservoir firmly with both hands and pull the unit sharply upward to disengage the locking feature on the washer reservoir from the depression in the radiator shroud.

(8) Continue lifting the washer reservoir upward far enough to disengage the three mounting tabs (one at the top and two at the bottom) from the channel-like slot at the top and the two slots at the bottom of the radiator shroud.

(9) Remove the washer reservoir from the right side of the engine compartment.

REMOVAL - DIESEL ENGINE

(1) Unlatch and open the hood.

(2) Disconnect and isolate the battery negative cable.

(3) Disengage the reservoir washer hose from the integral routing clips on the top of the radiator fan shroud (Fig. 16).

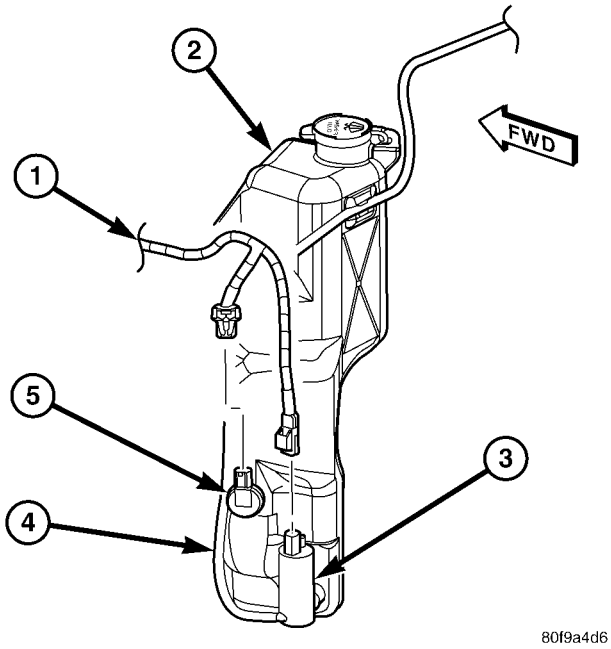

Fig. 16 Washer Reservoir Connections - Diesel Engine

2 - WASHER RESERVOIR
3 - WASHER PUMP/MOTOR
4 - WASHER HOSE
5 - WASHER FLUID LEVEL SWITCH

(4) Disconnect the reservoir washer hose from the barbed nipple of the inline fitting at the engine compartment washer hose in the right headlamp and dash wire harness and allow the washer fluid to drain from the reservoir into a clean container for reuse.

(5) Disconnect the left headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle.

(6) Disconnect the left headlamp and dash wire harness connector for the washer pump/motor unit from the motor connector receptacle.

(7) Remove the two screws that secure the washer reservoir to the left vertical member of the radiator support (Fig. 17).

(8) Remove the washer reservoir from the left side of the engine compartment.

WASHER RESERVOIR (Continued)

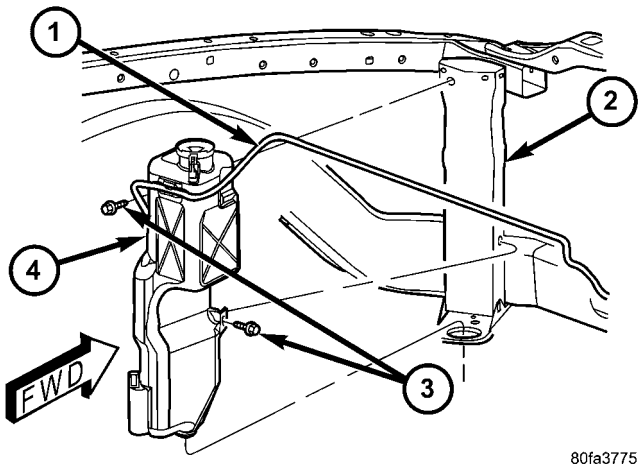

Fig. 17 Washer Reservoir Remove/Install - Diesel Engine

1 - RESERVOIR WASHER HOSE
2 - RADIATOR SUPPORT
3 - SCREW (2)
4 - WASHER RESERVOIR

INSTALLATION

INSTALLATION - EXCEPT DIESEL ENGINE

(1) Position the washer reservoir into the right side of the engine compartment.

(2) Align and insert the three mounting tabs (one at the top and two at the bottom) into the two slots at the bottom and the channel-like slot at the top of the radiator shroud (Fig. 15).

(3) Place both hands on the top of the washer reservoir and push the unit downward far enough for the locking feature on the washer reservoir to snap into the depression in the radiator shroud.

(4) Reconnect the right headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle.

(5) Reconnect the right headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle.

(6) Reconnect the reservoir washer hose to the barbed nipple of the inline fitting at the engine compartment washer hose in the right headlamp and dash wire harness.

(7) Reposition the coolant recovery container or the coolant pressure container to the top of the cooling module and reinstall the fasteners that secure it there. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION) or (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESSURE CONTAINER - INSTALLATION).

(8) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(9) Reconnect the battery negative cable.

(10) Close and latch the hood.

INSTALLATION - DIESEL ENGINE

(1) Position the washer reservoir into the left side of the engine compartment (Fig. 17).

(2) Install and tighten the two screws that secure the washer reservoir to the left vertical member of the radiator support. Tighten the screws to 10 N·m (85 in. lbs.).

(3) Reconnect the left headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle (Fig. 16).

(4) Reconnect the left headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle.

(5) Reconnect the reservoir washer hose to the barbed nipple of the inline fitting at the engine compartment washer hose in the right headlamp and dash wire harness.

(6) Engage the reservoir washer hose into the integral routing clips on the top of the radiator fan shroud.

(7) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(8) Reconnect the battery negative cable.

(9) Close and latch the hood.

WIPER ARM

DESCRIPTION

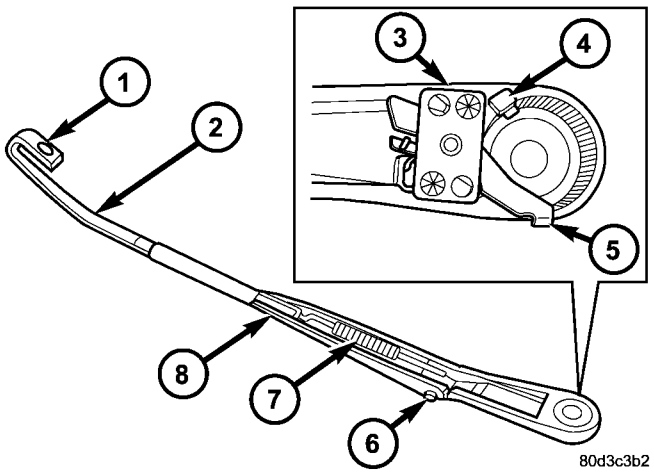

Fig. 18 Wiper Arm

1 - HOOK
2 - STRAP
3 - PIVOT END
4 - KEY
5 - LATCH
6 - HINGE PIN
7 - TENSION SPRING
8 - CHANNEL

The wiper arms are the rigid members located between the wiper pivots that protrude from the cowl

WIPER ARM (Continued)

plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass (Fig. 18). These wiper arms feature an over-center hinge that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast metal pivot end with a large internally serrated socket formation at one end. A key within the socket formation indexes the wiper arm to a keyway in the pivot shaft of the wiper module to provide wiper alignment, and a spring-loaded latch on the underside of the wiper arm pivot end locks the unit to the pivot shaft when it is fully installed. The right and left wiper arms for this model are not interchangeable, as the right wiper arm is slightly longer than the left one.

The wide end of a tapered, stamped steel channel hinges on and is secured with a hinge pin to the blade end of the wiper arm pivot end. One end of a long, rigid, stamped steel strap, with a small hole near its pivot end, is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook. Concealed within the stamped steel channel, one end of a long spring is engaged with a wire hook on the underside of the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

A wiper arm cannot be adjusted or repaired. If damaged or faulty, the entire wiper arm unit must be replaced.

OPERATION

The wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The serrated and keyed socket formation in the wiper arm pivot end interlocks with the serrations and keyway on the outer circumference of the wiper pivot shaft, providing positive engagement and alignment of this connection. The latch positively locks the wiper arm to the wiper pivot shaft when the arm is fully installed. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REMOVAL

(1) Lift the wiper arm to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to wiper pivot shaft connection.

(2) Pull the latch on the pivot end of the wiper arm outward (Fig. 19).

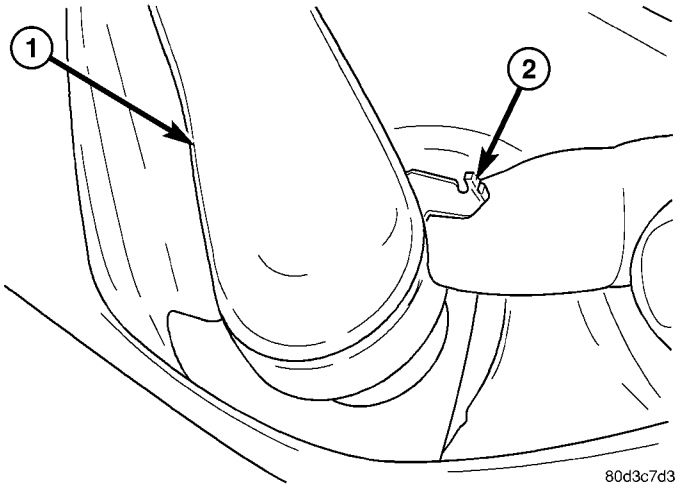

Fig. 19 Wiper Arm Remove/Install

1 - WIPER ARM PIVOT END
2 - LATCH

(3) Remove the wiper arm pivot end from the wiper pivot shaft.

INSTALLATION

The right and left wiper arms are not interchangeable. The right wiper arm is slightly longer than the left. Be certain that each wiper arm is installed on the proper wiper pivot.

(1) Place the wiper arm hinge in its over-center position prior to attempting installation.

(2) The wiper arms are indexed to the wiper pivot shafts with integral keys in the wiper arm pivot ends and keyways in the wiper pivot shafts. Align the key of the wiper arm to the keyway on the wiper pivot shaft.

(3) Once the wiper blade is aligned, push the pivot of the wiper arm down firmly and evenly over the wiper pivot shaft until it is fully engaged. When the wiper arm is fully engaged on the wiper pivot, the spring-loaded latch (Fig. 19) will snap back into place against the wiper arm pivot end.

(4) Gently lower the wiper arm until the wiper blade is in position on the windshield glass.

WIPER BLADE

DESCRIPTION

Each wiper blade is secured by an integral latching pivot block to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation (Fig. 20). The wiper blade consists of the following components:

WIPER BLADE (Continued)

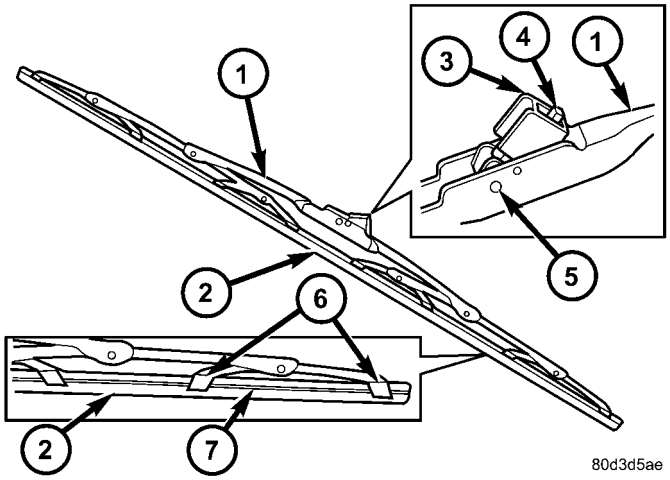

Fig. 20 Wiper Blade

1 - SUPERSTRUCTURE
2 - ELEMENT
3 - PIVOT BLOCK
4 - RELEASE TAB
5 - PIVOT PIN
6 - CLAWS
7 - FLEXOR

- **Superstructure** - The superstructure includes several stamped steel bridges and links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.
- **Element** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

All models have two 60.00 centimeter (23.62 inch) long wiper blades with non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If faulty, worn, or damaged the entire wiper blade unit must be replaced.

OPERATION

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the glass surface. The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

(1) Lift the wiper arm to raise the wiper blade and element off of the glass, until the wiper arm hinge is in its over-center position.

(2) To remove the wiper blade from the wiper arm, depress the pivot block latch release tab under the tip of the arm and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation on the end of the arm (Fig. 21).

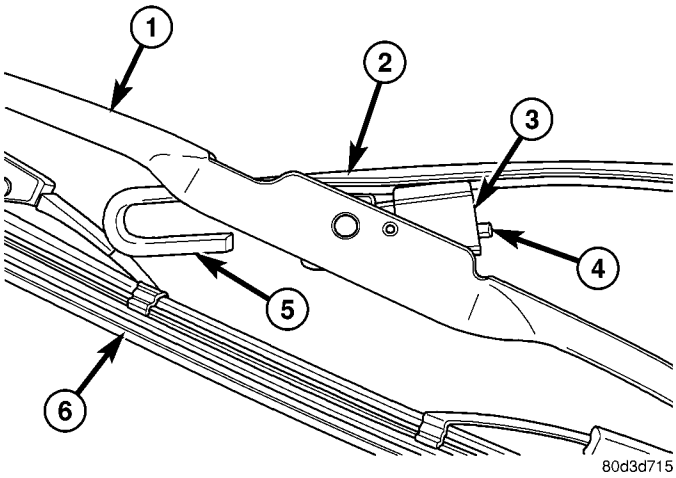

Fig. 21 Wiper Blade Remove/Install

1 - SUPERSTRUCTURE
2 - WIPER ARM
3 - PIVOT BLOCK
4 - RELEASE TAB
5 - HOOK
6 - ELEMENT

(3) Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure just ahead of the wiper blade pivot block/latch unit.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

(4) Gently lower the tip of the wiper arm onto the glass.

WIPER BLADE (Continued)

INSTALLATION

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

(1) Lift the wiper arm off of the windshield glass, until the wiper arm hinge is in its over-center position.

(2) Position the wiper blade near the hook formation on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.

(3) Insert the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit far enough to engage the pivot block into the hook (Fig. 21).

(4) Slide the wiper blade pivot block/latch up into the hook formation on the tip of the wiper arm until the latch release tab snaps into its locked position. Latch engagement will be accompanied by an audible click.

(5) Gently lower the wiper blade onto the glass.

WIPER HIGH/LOW RELAY

DESCRIPTION

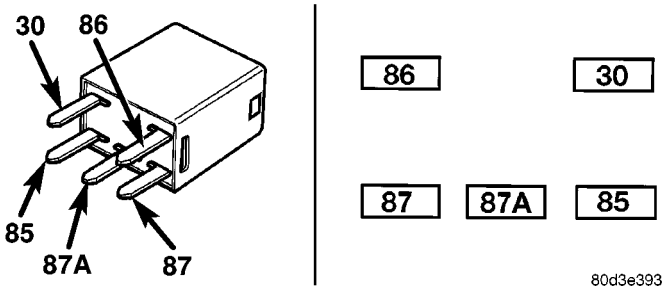

Fig. 22 ISO Micro Relay

30 - COMMON FEED
85 - COIL GROUND
86 - COIL BATTERY
87 - NORMALLY OPEN
87A - NORMALLY CLOSED

The wiper high/low relay is located in the Integrated Power Module (IPM) in the engine compartment near the battery. The wiper high/low relay is a conventional International Standards Organization (ISO) micro relay (Fig. 22). Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs by five integral male spade-type terminals that extend from the bottom of the relay base.

The wiper high/low relay cannot be adjusted or repaired and, if faulty or damaged, the unit must be replaced.

OPERATION

The wiper high/low relay is an electromechanical switch that uses a low current input from the Front Control Module (FCM) to control a high current output to the wiper motor. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The wiper high/low relay terminals are connected to the vehicle electrical system through a connector receptacle in the Integrated Power Module (IPM). The inputs and outputs of the wiper high/low relay include:

- **Common Feed Terminal** - The common feed terminal (30) is connected to the output of the wiper on/off relay at all times through the wiper on/off relay output circuit.
- **Coil Ground Terminal** - The coil ground terminal (85) is connected to a control output of the Front Control Module (FCM) through a wiper high/low relay control circuit. The FCM controls wiper motor operation by controlling a ground path through this circuit.
- **Coil Battery Terminal** - The coil battery terminal (86) receives battery current when the ignition switch is in the On or Accessory positions from a fuse in the Integrated Power Module (IPM) through a fused ignition switch output (run-acc) circuit.
- **Normally Open Terminal** - The normally open terminal (87) is connected to the high speed brush of the wiper motor through a wiper high/low relay high speed output circuit, and is connected to the high speed brush whenever the relay is energized.
- **Normally Closed Terminal** - The normally closed terminal (87A) is connected to the low speed brush of the wiper motor through a wiper high/low relay low speed output circuit, and is connected to the low speed brush whenever the relay is de-energized.

WIPER HIGH/LOW RELAY (Continued)

The wiper high/low relay can be diagnosed using conventional diagnostic tools and methods. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the instrument cluster, the Front Control Module (FCM), or the electronic message inputs to or outputs from the instrument cluster and the FCM that control the operation of the wiper high/low relay. The most reliable, efficient, and accurate means to diagnose the wiper high/low relay, the instrument cluster, the FCM, or the electronic message inputs and outputs related to the wiper high/low relay operation requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - WIPER HIGH/LOW RELAY

The wiper high/low relay (Fig. 23) is located in the Integrated Power Module (IPM) in the engine compartment near the battery. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

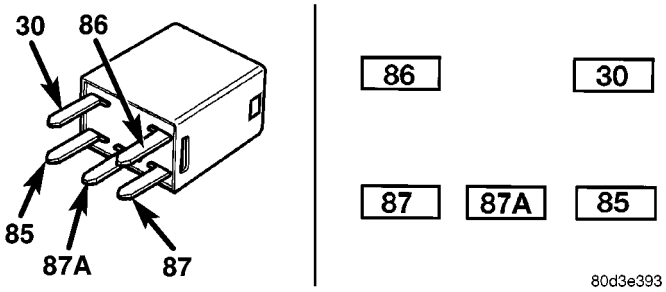

Fig. 23 ISO Micro Relay

30 - COMMON FEED
85 - COIL GROUND
86 - COIL BATTERY
87 - NORMALLY OPEN
87A - NORMALLY CLOSED

(1) Remove the wiper high/low relay from the IPM. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER HIGH/LOW RELAY - REMOVAL).

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 8 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, reinstall the relay and use a DRBIII® scan tool to perform further testing. Refer to the appropriate diagnostic information.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Integrated Power Module (IPM) (Fig. 24).

(3) Remove the wiper high/low relay by grasping it firmly and pulling it straight out from the receptacle in the IPM.

WIPER HIGH/LOW RELAY (Continued)

INSTALLATION

(1) Position the wiper high/low relay to the proper receptacle in the Integrated Power Module (IPM) (Fig. 24).

(2) Align the wiper high/low relay terminals with the terminal cavities in the IPM receptacle.

(3) Push firmly and evenly on the top of the wiper high/low relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(4) Reinstall the cover onto the IPM.

(5) Reconnect the battery negative cable.

WIPER MODULE

DESCRIPTION

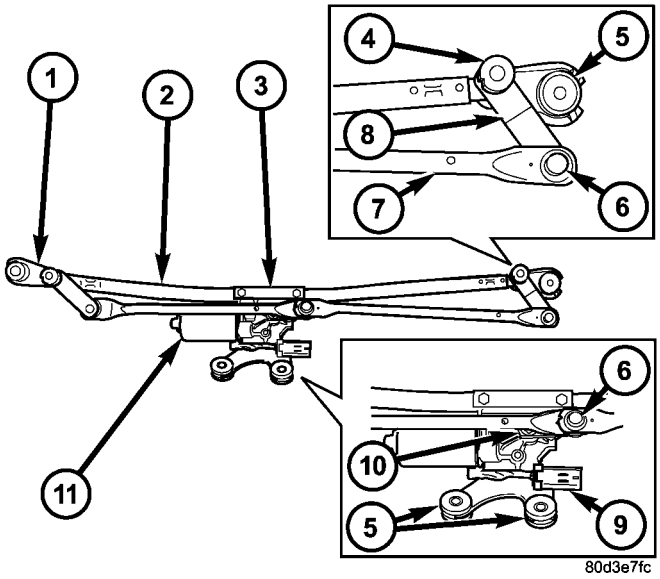

Fig. 25 Wiper Module

1 - PIVOT BRACKET (2)
2 - TUBE
3 - CLAMP
4 - PIVOT SHAFT (2)
5 - INSULATOR (4)
6 - LINKAGE BUSHING (4)
7 - DRIVE LINK (2)
8 - PIVOT CRANK ARM (2)
9 - PIGTAIL WIRE CONNECTOR
10 - MOTOR CRANK ARM
11 - WIPER MOTOR

The wiper motor bracket is secured with two screws below the wiper motor through two rubber insulators to the bottom of the cowl plenum panel beneath the cowl plenum cover/grille panel (Fig. 25). Two screws secure the top of the wiper module bracket to the cowl plenum panel through rubber insulators located on the outboard end of each pivot bracket. The ends of the wiper pivot shafts that protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades are the only visible components of the wiper module. The wiper module consists of the following major components:

- **Bracket** - The wiper module bracket consists of a long tubular steel main member that has a die cast pivot bracket formation near each end where the two wiper pivots are secured. A stamped steel clamp secures the center of the tubular member to the die cast bracket integral to the wiper motor with two screws.
- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.
- **Linkage** - Two stamped steel drive links connect the wiper motor crank arm to the wiper pivot lever arms. The left side drive link has a plastic socket-type bushing on each end. The right side drive link has a plastic socket-type bushing on one end, and a plastic sleeve-type bushing on the other end. The socket-type bushing on one end of each drive link is snap-fit over the ball stud on the lever arm of its respective pivot. The right side drive link sleeve-type bushing end is then fit over the motor crank arm ball stud, and the other socket-type bushing of the left side drive link is snap-fit over the exposed end of the wiper motor crank arm ball stud.
- **Motor** - The wiper motor features an integral die cast bracket to which the wiper module bracket is secured with a stamped steel clamp and two screws near the top and which has two rubber insulated mounting ears at the bottom. This die casting also serves as the wiper motor transmission housing from which the wiper motor output shaft exits. A nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker.
- **Pivots** - The two front wiper pivots are secured within the die cast pivot brackets on the outboard ends of the wiper module main member. The lever arms that extend from the center of the pivot shafts each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each has a serrated driver with a keyway. The lower ends of the pivot shafts are installed through lubricated bushings in the pivot brackets and are secured with snap rings.

The wiper module cannot be adjusted or repaired. If any component of the module is faulty or damaged, the entire wiper module unit must be replaced.

WIPER MODULE (Continued)

OPERATION

The wiper module operation is controlled by the battery current inputs received by the wiper motor through the wiper on/off and wiper high/low relays. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately opens and closes the wiper park switch sense circuit to ground, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads. The wiper motor crank arm, the two wiper linkage members, and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

REMOVAL

(1) Remove both wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARM - REMOVAL).

(2) Unlatch and open the hood.

(3) Disconnect and isolate the battery negative cable.

(4) Remove the cowl plenum cover/grille panel from over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(5) Disconnect the left headlamp and dash wire harness connector for the wiper motor from the motor pigtail wire connector (Fig. 26).

(6) Remove the two screws that secure the wiper module to the top of the cowl plenum panel at the pivot brackets.

(7) Remove the two screws that secure the wiper module to the bottom of the cowl plenum panel.

(8) Remove the wiper module from the cowl plenum panel as a unit.

INSTALLATION

(1) Position the wiper module into the cowl plenum as a unit (Fig. 26).

(2) Install the two screws that secure the wiper module to the top of the cowl plenum panel at the pivot brackets. Tighten the screw on the driver side, followed by the screw on the passenger side. Tighten the screws to 7 N·m (60 in. lbs.).

(3) Install and tighten the screws that secure the wiper module to the bottom of the cowl plenum panel. Tighten the screw on the passenger side, followed by the screw on the driver side. Tighten the screws to 7 N·m (60 in. lbs.).

(4) Reconnect the left headlamp and dash wire harness connector for the wiper motor to the motor pigtail wire connector.

(5) Reinstall the cowl plenum cover/grille panel over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(6) Reconnect the battery negative cable.

(7) Close and latch the hood.

(8) Reinstall both wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

WIPER ON/OFF RELAY

DESCRIPTION

The wiper on/off relay is located in the Integrated Power Module (IPM) in the engine compartment near the battery. The wiper on/off relay is a conventional International Standards Organization (ISO) micro relay (Fig. 27). Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs by five integral male spade-type terminals that extend from the bottom of the relay base.

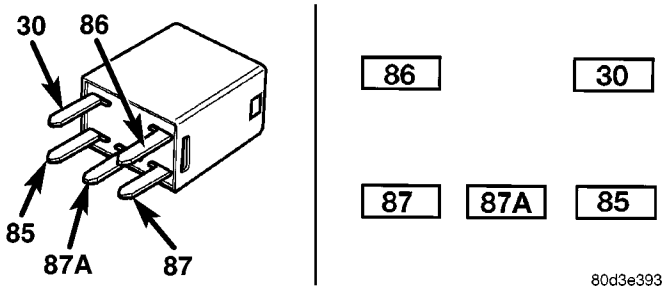

Fig. 27 ISO Micro Relay

30 - COMMON FEED
85 - COIL GROUND
86 - COIL BATTERY
87 - NORMALLY OPEN
87A - NORMALLY CLOSED

WIPER ON/OFF RELAY (Continued)

The wiper on/off relay cannot be adjusted or repaired and, if faulty or damaged, the unit must be replaced.

OPERATION

The wiper on/off relay is an electromechanical switch that uses a low current input from the Front Control Module (FCM) to control a high current output to the wiper motor. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The wiper on/off relay terminals are connected to the vehicle electrical system through a connector receptacle in the Integrated Power Module (IPM). The inputs and outputs of the wiper on/off relay include:

- **Common Feed Terminal** - The common feed terminal (30) is connected to the common feed terminal of the wiper high/low relay at all times through the wiper on/off relay output circuit.
- **Coil Ground Terminal** - The coil ground terminal (85) is connected to a control output of the Front Control Module (FCM) through a wiper on/off relay control circuit. The FCM controls wiper motor operation by controlling a ground path through this circuit.
- **Coil Battery Terminal** - The coil battery terminal (86) receives battery current at all times from a fuse in the IPM through a fused ignition switch output (run-acc) circuit.
- **Normally Open Terminal** - The normally open terminal (87) receives battery current at all times from a fuse in the IPM through a fused ignition switch output (run-acc) circuit, and provides battery current to the wiper on/off relay output circuit whenever the relay is energized.
- **Normally Closed Terminal** - The normally closed terminal (87A) is connected to ground at all times through a take out of the left headlamp and dash wire harness with an eyelet terminal connector that is secured by a screw to the front end sheet metal, and is connected to the wiper on/off relay output circuit whenever the relay is de-energized.

The wiper on/off relay may be diagnosed using conventional diagnostic tools and methods. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the instrument cluster, the Front Control Module (FCM), or the electronic message inputs to or outputs from the instrument cluster and the FCM that control the operation of the wiper on/off relay. The most reliable, efficient, and accurate means to diagnose the wiper on/off relay, the instrument cluster, the FCM, or the electronic message inputs and outputs related to the wiper on/off relay operation requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - WIPER ON/OFF RELAY

The wiper on/off relay (Fig. 28) is located in the Integrated Power Module (IPM) in the engine compartment near the battery. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

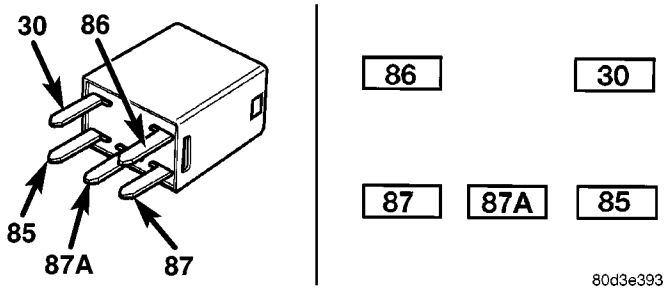

Fig. 28 ISO Micro Relay

30 - COMMON FEED
85 - COIL GROUND
86 - COIL BATTERY
87 - NORMALLY OPEN
87A - NORMALLY CLOSED

WIPER ON/OFF RELAY (Continued)

(1) Remove the wiper on/off relay from the IPM. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER ON/OFF RELAY - REMOVAL).

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 8 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, reinstall the relay and use a DRBIII® scan tool to perform further testing. Refer to the appropriate diagnostic information.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Integrated Power Module (IPM) (Fig. 29).

(3) Remove the wiper on/off relay by grasping it firmly and pulling it straight out from the receptacle in the IPM.

INSTALLATION

(1) Position the wiper on/off relay to the proper receptacle in the Integrated Power Module (IPM) (Fig. 29).

(2) Align the wiper on/off relay terminals with the terminal cavities in the IPM receptacle.

(3) Push firmly and evenly on the top of the wiper on/off relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(4) Reinstall the cover onto the IPM.

(5) Reconnect the battery negative cable.

NAVIGATION/ TELECOMMUNICATION

DESCRIPTION

TELECOMMUNICATIONS

The hands-free cellular system on this vehicle uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rearview mirror picks up vehicle occupant's voices. If a call is in progress when the ignition is switched off, the hands-free system will continue to operate for up to 45 seconds as part of the Accessory Relay Delay function. Thereafter, the call can continue on the hand-held telephone.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to seven telephones, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

Two buttons on the rearview mirror, identified with ISO icons, control the system: A ″phone″ button turns the system on and off; a ″voice recognition″ (or voice command) button prompts the hands-free system to listen for a voice command.

OPERATION

TELECOMMUNICATION

Two buttons on the rearview mirror, identified with ISO icons, control the system: A ″phone″ button turns the system on and off; a ″voice recognition″ (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

- Phone book - Stores telephone numbers for later recall by name or other verbal identification, called a voice tag, and memory location.
- Four memory locations - Home, Work, Cellular and Pager. A maximum of 32 unique names or voice tags may be stored at the same time, with a different number in each of the four memory locations.
- Voice tag dialing - Dials the number associated with a voice tag and memory location.
- Digit dialing - Dials the telephone number by recognizing the names of the digits as they are spoken.
- Receiving calls - A voice prompt notifies the user of an incoming call. A voice response accepts or rejects the call without manual intervention.
- Privacy Mode - Switches the call to the hand-held telephone and the hands-free system and back again using the “voice recognition” (or “voice command”) button and a voice command, if desired.

HANDS FREE MODULE

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the instrument panel right side end cap.
(3) Remove the mounting fasteners (Fig. 1).
(4) Disconnect the electrical harness connector and remove module.

INSTALLATION

(1) Connect the electrical harness connector and position module.
(2) Install and tighten the mounting fasteners.
(3) Install the instrument panel right side end cap.
(4) Connect battery negative cable.

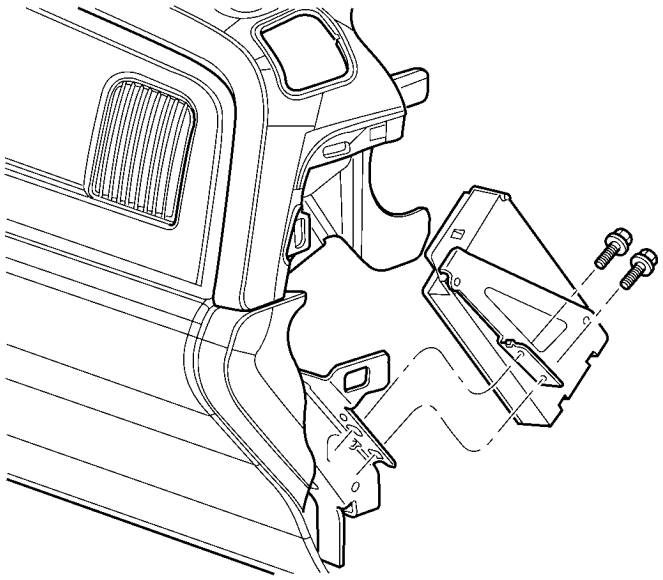

Fig. 1 HANDS FREE MODULE

WIRING DIAGRAM INFORMATION

DESCRIPTION

DESCRIPTION - HOW TO USE WIRING DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

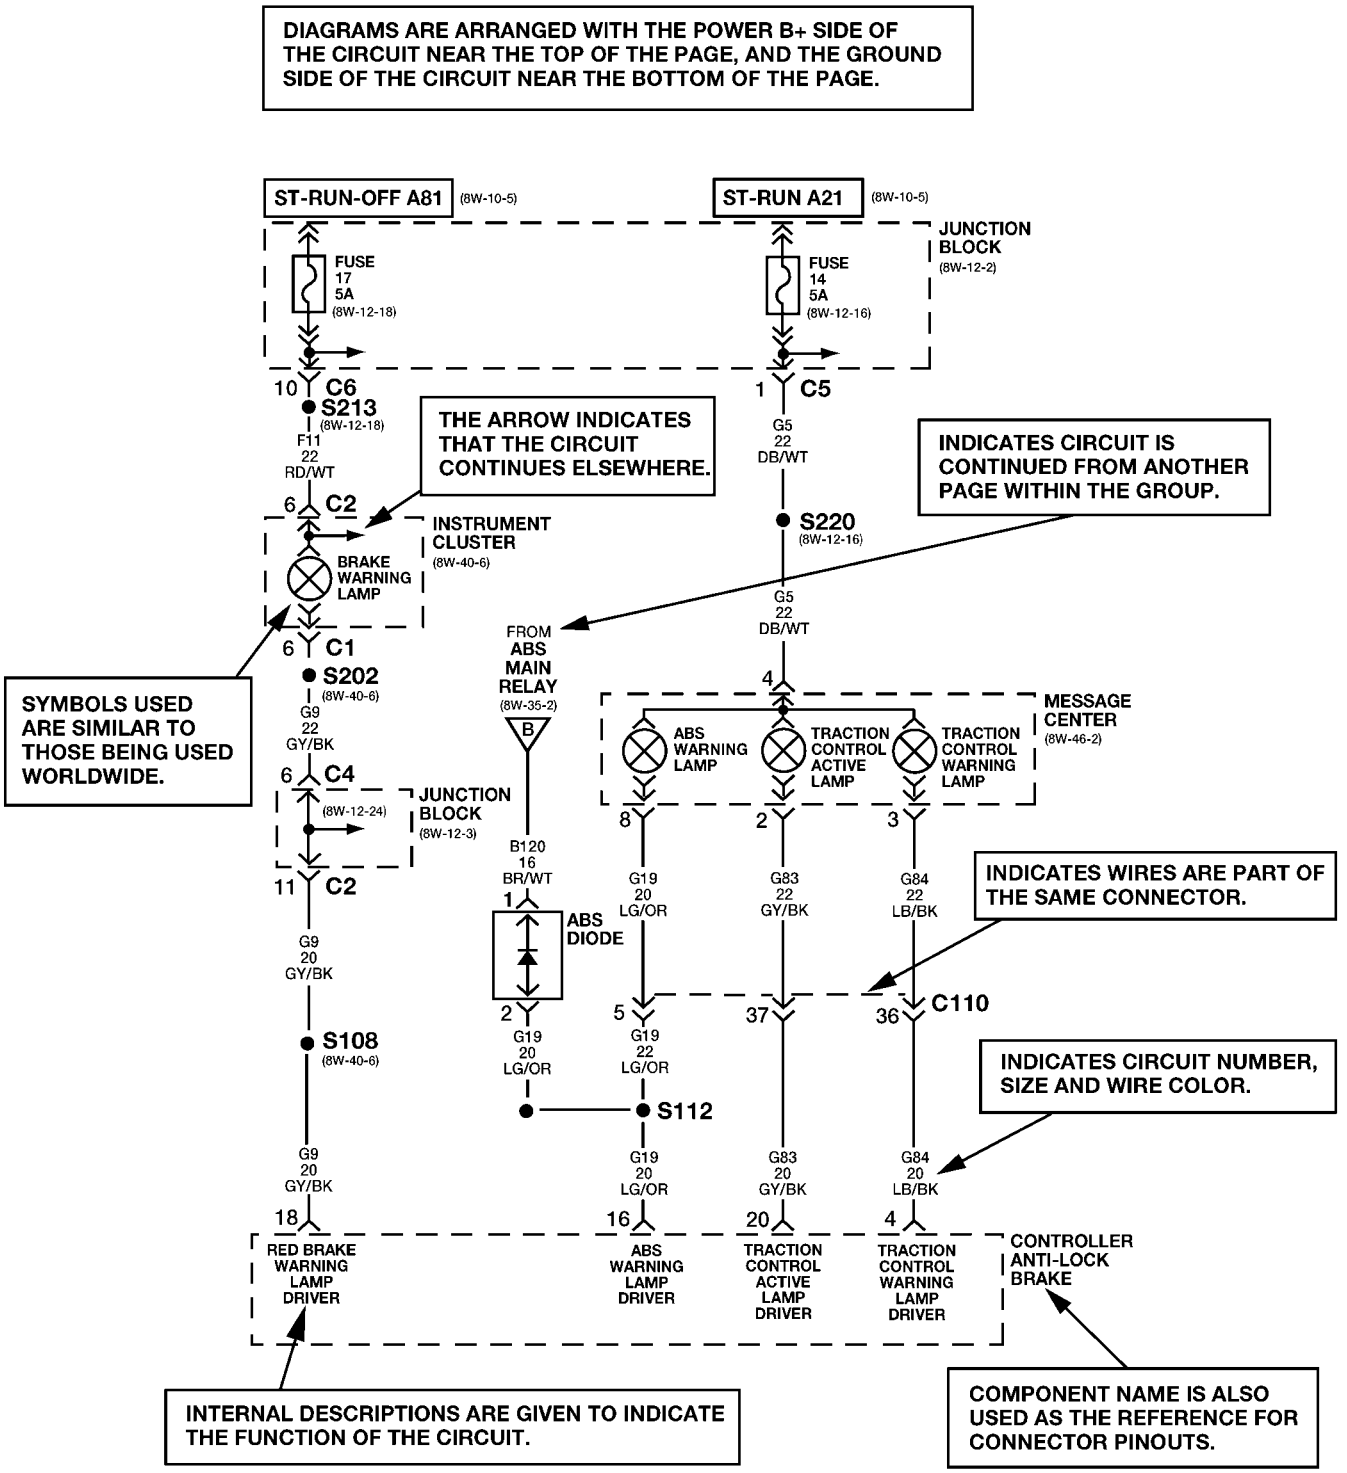
Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

WIRING DIAGRAM INFORMATION (Continued)



The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM SECTION.

WIRING DIAGRAM INFORMATION (Continued)

DESCRIPTION - CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)

V	SPEED CONTROL, WIPER/ WASHER
W	OPEN
X	AUDIO SYSTEMS
Y	OPEN
Z	GROUNDS

DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

WIRING SECTION CHART

GROUP	TOPIC
8W-01 thru 8W-09	General information and Diagram Overview
8W-10 thru 8W-19	Main Sources of Power and Vehicle Grounding
8W-20 thru 8W-29	Starting and Charging
8W-30 thru 8W-39	Powertrain/Drivetrain Systems
8W-40 thru 8W-49	Body Electrical items and A/C
8W-50 thru 8W-59	Exterior Lighting, Wipers and Trailer Tow
8W-60 thru 8W-69	Power Accessories
8W-70	Splice Information
8W-80	Connector Pin Outs
8W-91	Connector, Ground and Splice Locations

WIRING DIAGRAM INFORMATION (Continued)

DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION

CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

IDENTIFICATION

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers
- In-line connectors located in the Instrument Panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a "G" and follow the same series numbering as the in-line connectors.
- Splices are identified with an "S" and follow the same series numbering as the in-line connectors.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

LOCATIONS

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

WARNING

WARNINGS - GENERAL

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND AVOID LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

WIRING DIAGRAM INFORMATION (Continued)

• Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

• Probing Tools - These tools are used for probing terminals in connectors (Fig. 5). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

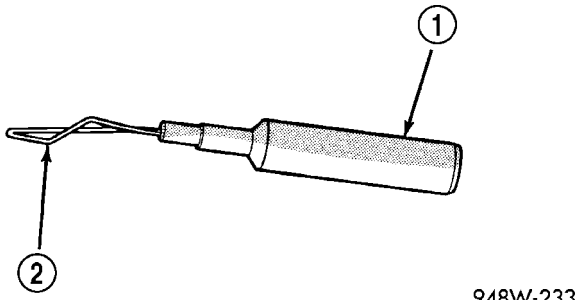

Fig. 5 PROBING TOOL

1 - SPECIAL TOOL 6801
2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

(1) Verify the problem.

(2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.

(3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.

(4) Isolate the problem area.

(5) Repair the problem area.

(6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE

STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

All ESD sensitive components are solid state and a symbol (Fig. 6) is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

(1) Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.

(2) Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.

(3) When using a voltmeter, be sure to connect the ground lead first.

(4) Do not remove the part form it's protective packing until it is time to install the part.

(5) Before removing the part from it's pakage, ground the pakage to a known good ground on the vehicle.

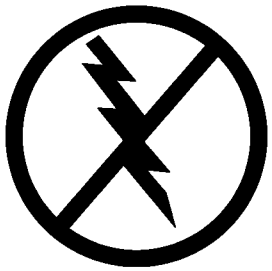

Fig. 6 ELECTROSTATIC DISCHARGE SYMBOL

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL

(1) Connect the ground lead of a voltmeter to a known good ground (Fig. 7).

(2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

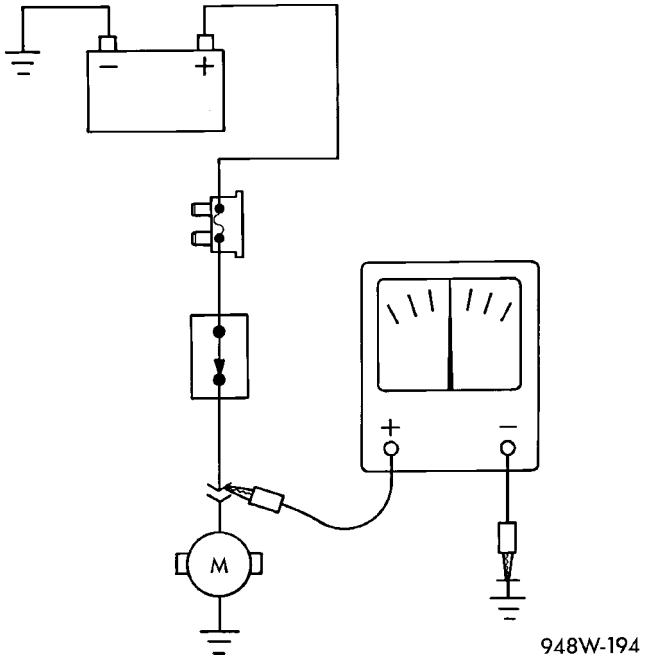

Fig. 7 TESTING FOR VOLTAGE POTENTIAL

STANDARD PROCEDURE - TESTING FOR CONTINUITY

(1) Remove the fuse for the circuit being checked or, disconnect the battery.

(2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 8).

(3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

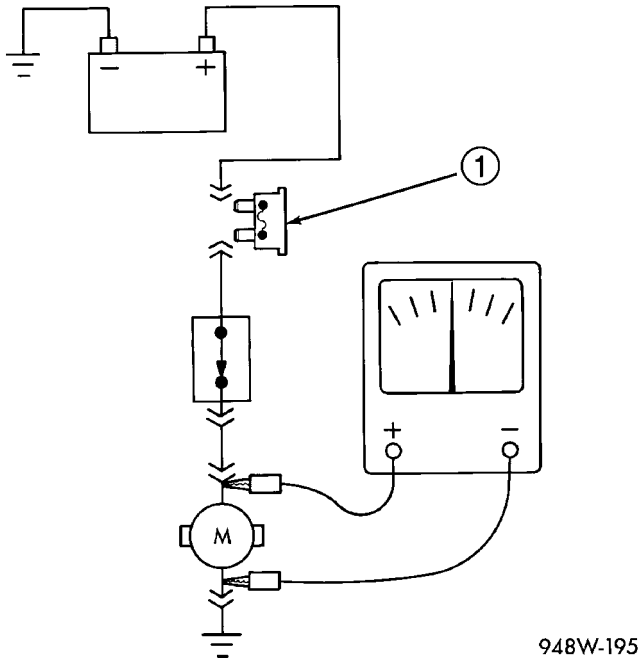

Fig. 8 TESTING FOR CONTINUITY

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

(1) Remove the fuse and disconnect all items involved with the fuse.

(2) Connect a test light or a voltmeter across the terminals of the fuse.

(3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.

(4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

(1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
(2) Replace the blown fuse.
(3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
(4) Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

(1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 9).
(2) Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
(3) Operate the item.
(4) The voltmeter will show the difference in voltage between the two points.

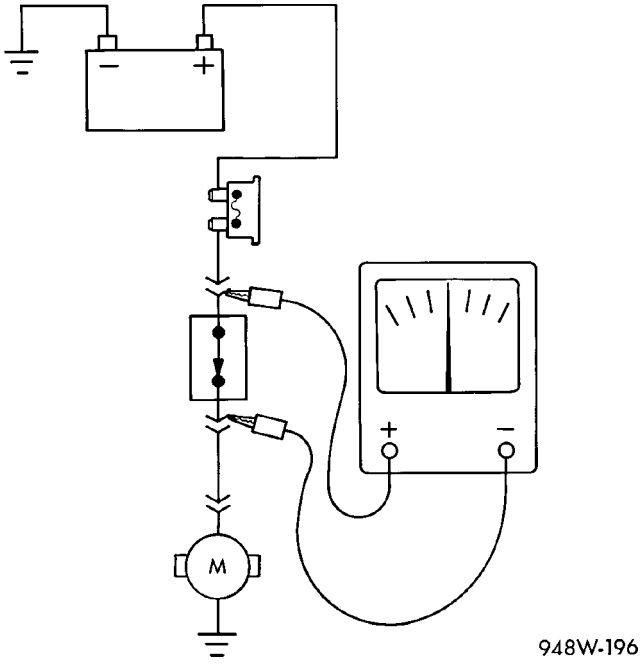

Fig. 9 TESTING FOR VOLTAGE DROP

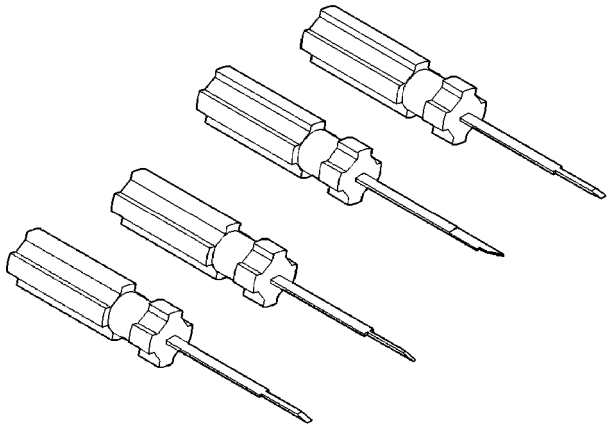
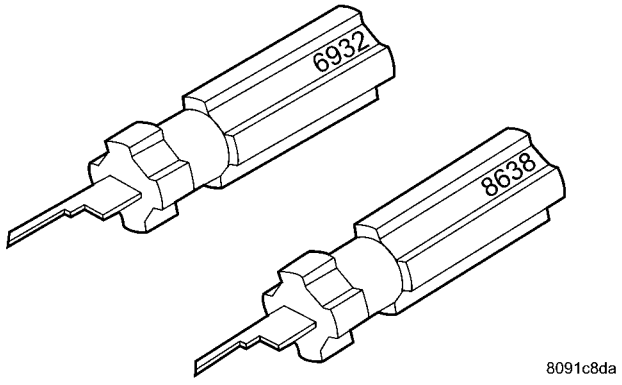
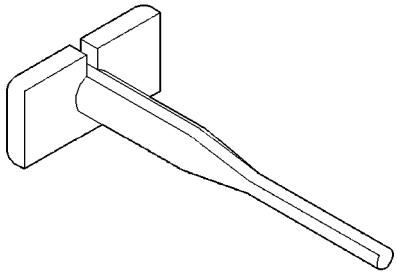
PROBING TOOL PACKAGE 6807



TERMINAL PICK TOOL SET 6680



TERMINAL REMOVING TOOLS 6932 AND 8638



TERMINAL REMOVING TOOL 6934

CONNECTOR

REMOVAL

(1) Disconnect battery.
(2) Release Connector Lock (Fig. 10).
(3) Disconnect the connector being repaired from its mating half/component.
(4) Remove the dress cover (if applicable) (Fig. 10).

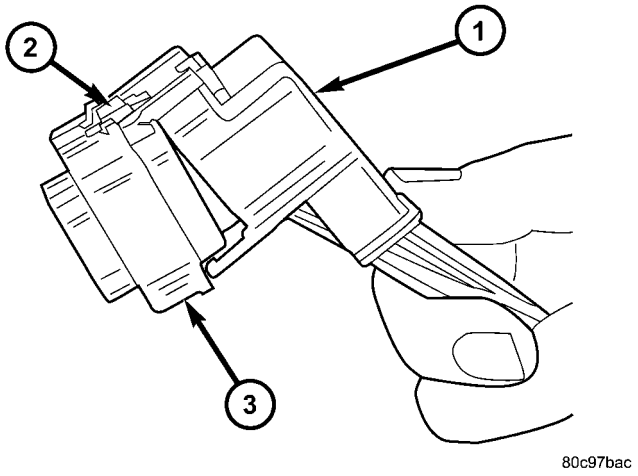


Fig. 10 REMOVAL OF DRESS COVER

1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR

(5) Release the Secondary Terminal Lock, if required (Fig. 11).
(6) Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector (Fig. 12).

INSTALLATION

(1) Insert the removed terminal in the same cavity on the repair connector.
(2) Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
(3) When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.
(4) Replace dress cover (if applicable).
(5) Connect connector to its mating half/component.
(6) Connect battery and test all affected systems.

12 - SPECIAL TOOL 8638

DIODE

REMOVAL

(1) Disconnect the battery.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 13).

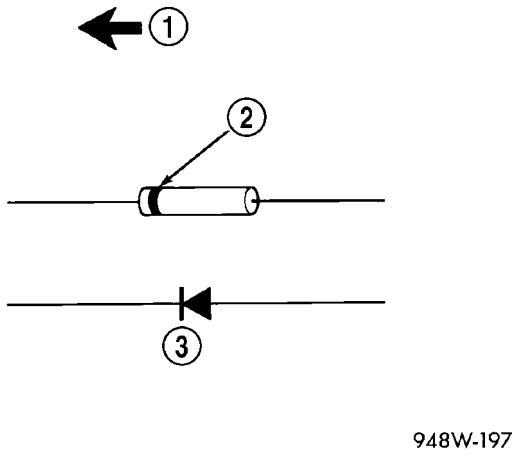

Fig. 13 DIODE IDENTIFICATION

1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

(1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 13).

(3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.

(5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

(1) Follow steps for removing terminals described in the connector removal section.

(2) Cut the wire 6 inches from the back of the connector.

INSTALLATION

(1) Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.

(2) Cut the repair wire to the proper length and remove one–half (1/2) inch of insulation.

(3) Splice the repair wire to the wire harness (see wire splicing procedure).

(4) Insert the repaired wire into the connector.

(5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.

(6) Re-tape the wire harness starting at 1–1/2 inches behind the connector and 2 inches past the repair.

(7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 14).

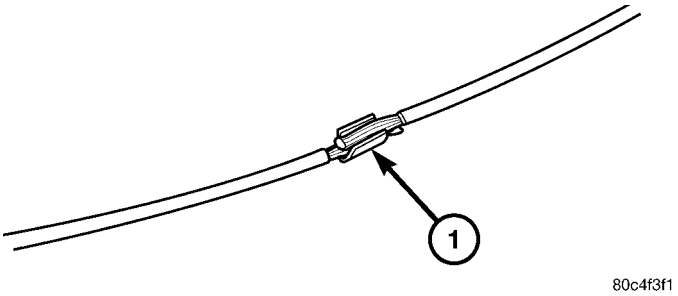

Fig. 14 SPLICE BAND

1 - SPLICE BAND

(4) Using crimping tool, Mopar p/n 05019912AA, crimp the splice clip and wires together (Fig. 15).

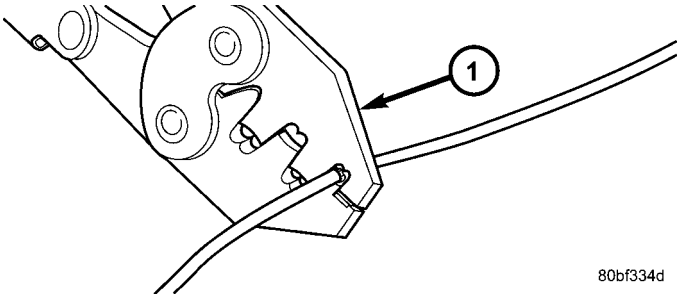

Fig. 15 CRIMPING TOOL

1 - CRIMPING TOOL

(5) Solder the connection together using rosin core type solder only (Fig. 16).

CAUTION: DO NOT USE ACID CORE SOLDER.

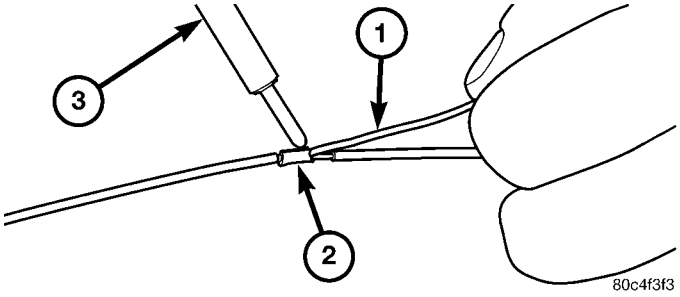

Fig. 16 SOLDER SPLICE

1 - SOLDER
2 - SPLICE BAND
3 - SOLDERING IRON

(6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 17).

8W-02 COMPONENT INDEX

Component	Page
A/C Compressor Clutch	8W-42
A/C Compressor Clutch Relay	8W-42
A/C Pressure Transducer	8W-42
A/C-Heater Control	8W-42
Accelerator Pedal Position Sensor	8W-30
Adjustable Pedal Motor	8W-30
Adjustable Pedal Relay	8W-30
Adjustable Pedal Switch	8W-30
Airbag Control Module	8W-43
Airbag-Squibs	8W-43
Airbag-Curtains	8W-43
Airbag-Passenger On/Off Switch	8W-43
Ambient Temperature Sensor	8W-49
Amplifier Audio	8W-47
Ashtray Lamp	8W-44
Auto Shut Down Relay	8W-30
Automatic Day/Night Mirror	8W-49, 55
Auxiliary Battery	8W-20
Backup Lamp Switch	8W-51
Battery	8W-20
Battery Temperature Sensor	8W-30
Blend Door Actuators	8W-42
Blower Motor	8W-42
Blower Motor Resistor Block	8W-42
Brake Fluid Level Switch	8W-34, 35
Brake Lamp Switch	8W-33
Brake Transmission Shift Interlock Solenoid	8W-40
Camshaft Position Sensor	8W-30
Capacitor	8W-30
Center High Mounted Stop Lamp-Aftermarket	8W-51
Center High Mounted Stop Lamp/Cargo Lamp	8W-44, 51
Cigar Lighter Outlet	8W-41
Circuit Breaker	8W-10
Clearance Lamps	8W-50
Clockspring	8W-33, 41, 43, 47
Clutch Interlock Brake Switch	8W-21
Coil On Plugs	8W-30
Compass/Mini-Trip Computer	8W-49
Condenser Fan	8W-42
Condenser Fan Relay	8W-42

Seat Belt Tensioner-Passenger	8W-80-94
Seat Heater Interface Module	8W-80-94
Sentry Key Immobilizer Module (SKIM)	8W-80-95
Side Impact Sensor-Left	8W-80-95
Side Impact Sensor-Right	8W-80-95
Speaker-Center Instrument Panel	8W-80-95
Speaker-Left Front Door	8W-80-95
Speaker-Left Instrument Panel	8W-80-96
Speaker-Left Rear	8W-80-96
Speaker-Right Front Door	8W-80-96

Component	Page
Speaker-Right Instrument Panel	8W-80-96
Speaker-Right Rear	8W-80-96
Speed Control Servo (Diesel A/T/NGC)	8W-80-97
Speed Control Switch-Left (ETC)	8W-80-97
Speed Control Switch-Left (Except ETC)	8W-80-97
Speed Control Switch-Right (ETC)	8W-80-97
Speed Control Switch-Right (Except ETC)	8W-80-97
Tail/Stop/Turn Signal Lamp-Left	8W-80-98
Tail/Stop/Turn Signal Lamp-Right	8W-80-98
Tailgate Lamp	8W-80-98
Throttle Position Sensor (3.7L)	8W-80-98
Throttle Position Sensor (4.7L)	8W-80-99
Tow/haul Overdrive Switch	8W-80-99
Trailer Tow Connector	8W-80-99
Trailer Tow Connector-Add On	8W-80-99
Transfer Case Control Module C1 (Electric 4x4)	8W-80-100
Transfer Case Control Module C2 (Electric 4x4)	8W-80-100
Transfer Case Control Module C3 (Electric 4x4)	8W-80-101
Transfer Case Mode Sensor	8W-80-101
Transfer Case Selector Switch	8W-80-101
Transfer Case Shift Motor	8W-80-101
Transmission Range Sensor	8W-80-102
Transmission Solenoid Assembly (48RE)	8W-80-102
Transmission Solenoid/TRS Assembly (NGC)	8W-80-102
Vacuum Pump (Diesel)	8W-80-103
Vistronic Fan Drive (Diesel)	8W-80-103
Washer Fluid Level Switch	8W-80-103
Washer Pump Motor-Front	8W-80-103
Water In Fuel Sensor	8W-80-103
Wheel Speed Sensor-Left Front	8W-80-104
Wheel Speed Sensor-Rear	8W-80-104
Wheel Speed Sensor-Right Front	8W-80-104
Wiper Motor	8W-80-104

CONNECTOR/GROUND/SPLICE LOCATION
DESCRIPTION 1

CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION

This section provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided. Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

CONNECTORS

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
4WD Switch (Manual Transfer Case)	BK	Near T/O for Backup Lamp Switch	16, 17, 19
A/C Compressor Clutch	BK	At A/C Compressor	3, 6, 7, 10
A/C Pressure Transducer	BK	Left Side of A/C Compressor	6, 7, 10
A/C-Heater Control C1	BK	Center of Instrument Panel	34, 35, 36
A/C-Heater Control C2	BK	Center of Instrument Panel	34, 35
Accelerator Pedal Position Sensor		Under Battery Tray	22, 27
Adjustable Pedal Motor	WT	Left of Instrument Panel	31
Adjustable Pedal Switch	BL	Left of Instrument Panel	35, 38
Airbag Control Module C1	YL	Lower Center of Instrument Panel	35, 36
Airbag Control Module C2	YL	Lower Center of Instrument Panel	44, 46
Airbag Control Module-Left Side Impact	YL	Left B-Pillar	44, 46
Airbag Control Module-Right Side Impact	YL	Right B-Pillar	45, 47
Airbag-Driver Squib 1	YL	On Steering Wheel	N/S
Airbag-Left Curtain	YL	Top Left B-Pillar	44, 46
Airbag-Passenger	YL	Right Front of Instrument Panel	35, 39
Airbag-Right Curtain	YL	Top Right B-Pillar	45, 47
Ambient Temperature Sensor	BK	Left Rear of Hood	23, 29
Amplifier Audio C1	GY	Top Center of Instrument Panel	35, 39
Amplifier Audio C2	GY	Top Center of Instrument Panel	35, 39
Ashtray Lamp		Center Stack	35
Automatic Day/Night Mirror (Except Base)	BK	Top Center of Windshield	N/S
Backup Lamp Switch	BK	Left Rear of Transmission	12, 13, 17, 19

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
Battery Temperature Sensor	BK	Below Battery Tray	22, 25, 26, 28
Blend Door Actuator (Single Zone)	BK	Behind Right Side of Instrument Panel	N/S
Blower Motor	BK	Behind Right Side of Instrument Panel	N/S
Blower Motor Resistor Block	BK	Behind Right Side of Instrument Panel	N/S
Brake Lamp Switch	BK	Top of Brake Pedal Arm	30, 35, 38
Brake Transmission Shift Interlock Solenoid	BK	Near Steering Column	31, 35, 38
C102		Near Integrated Power Module	25
C106	BK	Left Rear Engine	7

POWER DISTRIBUTION

DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Integrated Power Module (IPM)
- Front Control Module (FCM)
- Power Distribution Center (PDC)
- Power Outlets
- Cigar Lighter Outlets
- Relays

Refer to Wiring Diagrams for complete circuit schematics.

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Relays

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components.

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate many accessories that the vehicle owner may choose to have installed in the aftermarket.

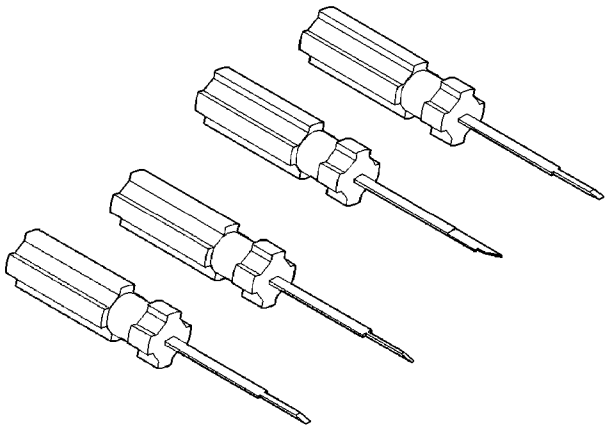
POWER DISTRIBUTION SYSTEMS



Terminal Pick Kit 6680

CIGAR LIGHTER OUTLET

DESCRIPTION

On models equipped a cigar lighter outlet is installed to the left of the center stack area in the lower instrument panel. The cigar lighter outlet is secured by a snap fit within the bezel.

The cigar lighter outlet, plastic cap and the knob and heating element unit are available for service replacement. These components cannot be repaired and, if faulty or damaged, they must be replaced.

OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or outlet shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The cigar lighter receives battery voltage from a fuse in the junction block when the ignition switch is in the Accessory or Run positions.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the outlet shell, the heating element resistor coil is grounded through its housing to the outlet shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the outlet shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the outlet shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the outlet shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

DIAGNOSIS AND TESTING - CIGAR LIGHTER OUTLET

For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Check the fused B(+) fuse in the integrated power module. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Run position. Check for battery voltage at the fused B(+) fuse in the integrated power module. If OK, go to Step 3. If not OK, repair the open or short as required.

(3) Remove the cigar lighter knob and element from the cigar lighter outlet shell. Check for continuity between the inside circumference of the cigar lighter outlet shell and a good ground. there should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Turn the ignition switch to the Run position. Check for battery voltage at the insulated contact located at the back of the cigar lighter outlet shell. If OK, replace the faulty cigar lighter knob and element. If not OK, go to Step 5.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Turn the ignition switch to the Accessory or Run positions. Check for battery voltage at the fused B(+) circuit cavity of the cigar lighter wire harness connector. If OK, replace the faulty cigar lighter outlet. If not OK, repair the open fused B(+) circuit to the integrated power module fuse as required.

INTEGRATED POWER MODULE

DESCRIPTION

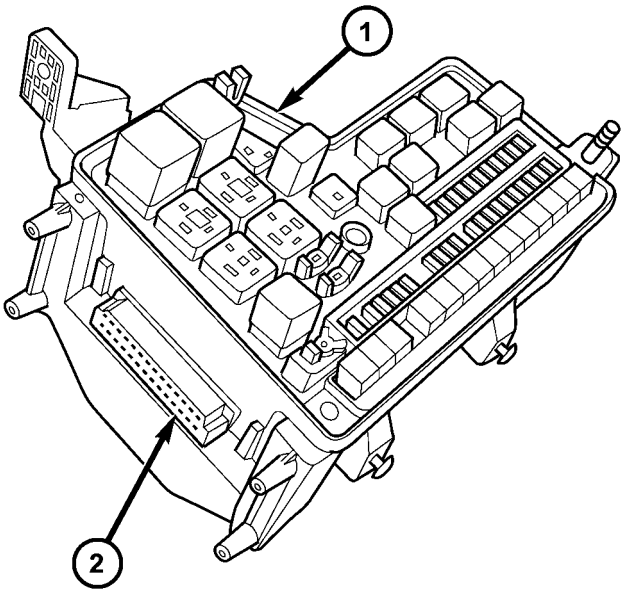


Fig. 1 DR INTEGRATED POWER MODULE

1 - POWER DISTRIBUTION CENTER HOUSING
2 - FRONT CONTROL MODULE ELECTRICAL CONNECTOR

The Integrated Power Module (IPM) (Fig. 1) is a combination of the Power Distribution Center (PDC) and the Front Control Module (FCM). The IPM is located in the engine compartment, next to the battery on this model. The power distribution center mates directly with the Front Control Module (FCM) to form the Integrated Power Module Fuse and Relay Center. The power distribution center (PDC) is a printed circuit board based module that contains fuses and relays, while the front control module contains the electronics controlling the integrated power module and other functions. This integrated power module connects directly to the battery positive via a stud located on top of the unit. The ground connection is via electrical connectors. The integrated power module provides the primary means of voltage distribution and protection for the entire vehicle.

The molded plastic integrated power module housing includes a base and cover. The integrated power module cover is easily opened or removed for service access by unscrewing the cover retaining nut and has a fuse and relay layout map integral to the inside surface of the cover. This integrated power module housing base and cover are secured in place via bolts to the left front fender support assembly.

Replaceable components of the integrated power module assembly are broken down into the following components: the Power Distribution Center (PDC), the integrated power module cover, the Front Control Module (FCM) and the Integrated Power Module Assembly which includes the power distribution center, the cover and FCM. **Refer to the Front Control Module in the Electronic Control Module section** of this service manual for information on the front control module.

OPERATION

All of the current from the battery and the generator output enters the integrated power module via a stud on the top of the module. The integrated power module cover is removed to access the fuses or relays. Internal connections of all of the power distribution center circuits is accomplished by a combination of bus bars and a printed circuit board. Refer to the Wiring section of the service manual for complete integrated power module circuit schematics.

REMOVAL

(1) Disconnect the negative and positive battery cables.

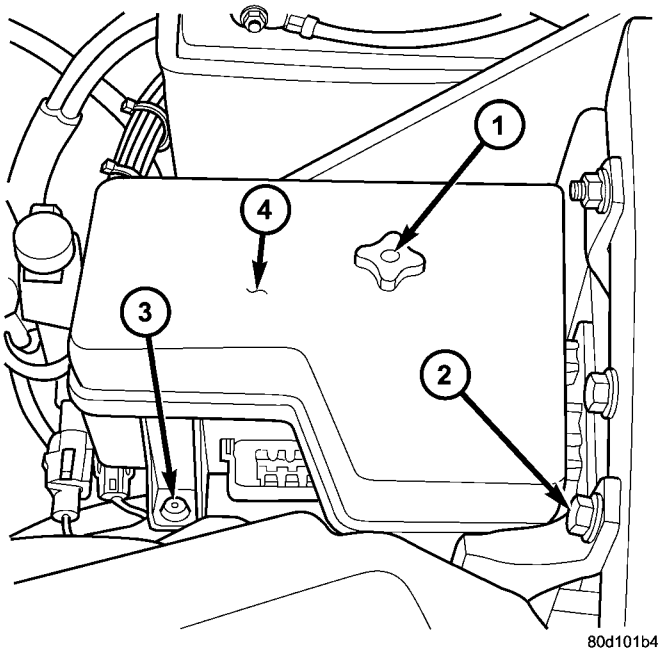

Fig. 2 DR INTEGRATED POWER MODULE

1 - COVER RETAINING BOLT
2 - INTEGRATED POWER MODULE RETAINING BOLT
3 - RETAINING SCREW
4 - INTEGRATED POWER MODULE COVER

(2) Unsnap cover and remove the B+ terminal nut from the integrated power module B+ terminal. Remove the B+ cable from the integrated power module.

(3) Disconnect the gray connector from the integrated power module.

INTEGRATED POWER MODULE (Continued)

(4) Remove the integrated power module retaining bolt and screw (Fig. 2).

(5) Grasp the integrated power module with two hands and slide the assembly in the direction shown (Fig. 3) to free the module from its mounting bracket. Position the assembly upside down to access the electrical connectors located on the bottom of the unit.

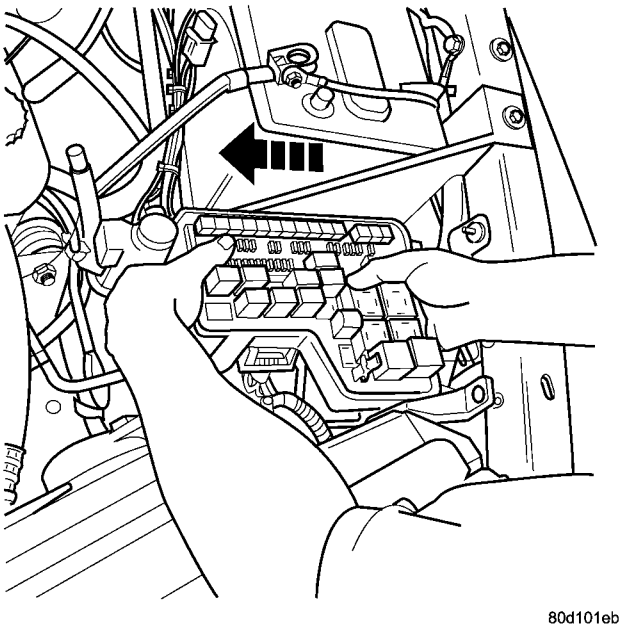

Fig. 3 REMOVING INTEGRATED POWER MODULE

(6) Disconnect the electrical connectors by depressing the locking tab and rotating the connector arm outboard, until the connector is free from the module assembly. Be certain to pull the connectors straight off.

(7) Position the integrated power module on a bench and remove the four front control module retaining screws.

(8) Disconnect the front control module by pulling it straight off the integrated power module.

LLATION

INSTALLATION

(1) Connect the front control module by pushing it straight on the integrated power module electrical receptacle.

(2) Install the four front control module retaining screws. Torque to 30 in. lbs. +/-5.

NOTE: Integrated power module electrical connectors are color coded to ease location reference (Fig. 4).

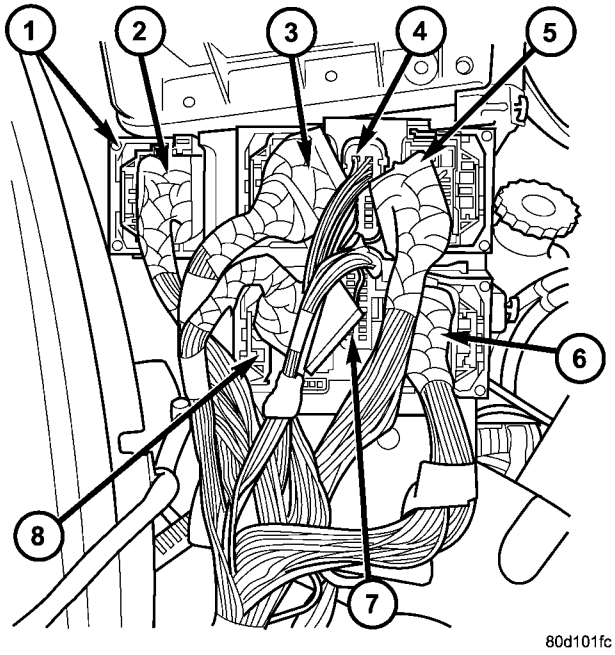

Fig. 4 INTEGRATED POWER MODULE ELECTRICAL CONNECTIONS

8 - BLACK CONNECTOR

INTEGRATED POWER MODULE (Continued)

(3) Connect the electrical connectors by pushing straight on and rotating the connector arm inboard, until the connector is firmly locked in place on the module assembly.

(4) Grasp the integrated power module with two hands and install the assembly on the battery tray (Fig. 5).

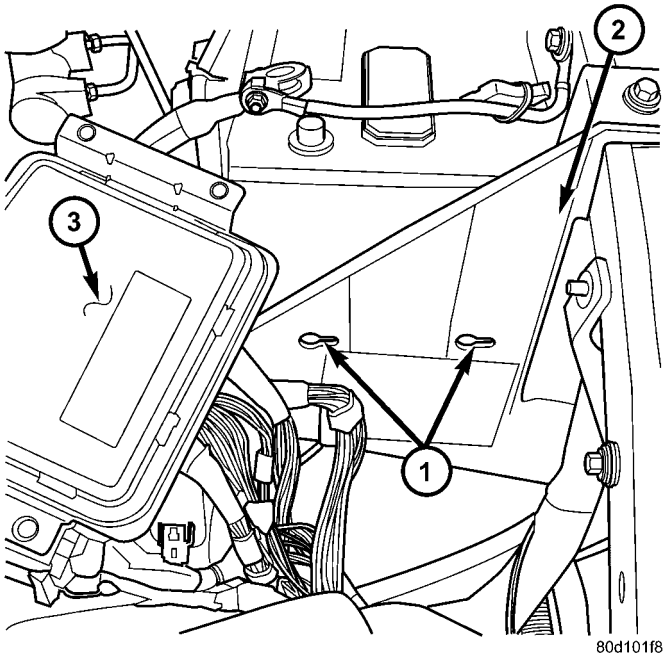

Fig. 5 INTEGRATED POWER MODULE MOUNTING TABS

1 - INTEGRATED POWER MODULE MOUNTING HOLES
2 - BATTERY TRAY ASSEMBLY
3 - FRONT CONTROL MODULE

(5) Install the integrated power module retaining bolt and screw.

(6) Connect the gray connector on the integrated power module housing.

(7) Install the B+ terminal cable and nut on the integrated power module B+ terminal. Snap the cover in place.

(8) Connect the negative and positive battery cables.

FRONT CONTROL MODULE

DESCRIPTION

The Front Control Module (FCM) is a micro controller based module located in the left front corner of the engine compartment. On this model the integrated power module must be positioned aside in order to access the front control module. The front control module mates to the power distribution center to form the Integrated Power Module (IPM). The integrated power module connects directly to the battery and provides the primary means of circuit protection and power distribution for all vehicle electrical systems. The front control module controls power to some of these vehicle systems electrical and electromechanical loads based on inputs received from hard wired switch inputs and data received on the PCI bus circuit (J1850).

For information on the **Integrated Power Module Refer to the Power Distribution Section** of the service manual.

OPERATION

As messages are sent over the PCI bus circuit, the front control module reads these messages and controls power to some of the vehicles electrical systems by completing the circuit to ground (low side driver) or completing the circuit to 12 volt power (high side driver). The following functions are **Controlled** by the Front Control Module:

- Headlamp Power with Voltage Regulation
- Windshield Wiper “ON/OFF” Relay Actuation
- Windshield Wiper “HI/LO” Relay Actuation
- Windshield Washer Pump Motor
- Fog Lamp Relay Actuation
- Park Lamp Relay Actuation
- Horn Relay Actuation

The following inputs are **Received/Monitored** by the Front Control Module:

- B+ Connection Detection
- Power Ground
- Ambient Temperature Sensing
- Ignition Switch Run
- Washer Fluid Level Switch
- Windshield Wiper Park Switch
- PCI Bus Circuit

DIAGNOSIS AND TESTING - FRONT CONTROL MODULE

The front control module is a printed circuit board based module with a on-board micro-processor. The front control module interfaces with other electronic modules in the vehicle via the Programmable Communications Interface (PCI) data bus (J1850). In order to obtain conclusive testing the Programmable Communications Interface (PCI) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the front control module must be checked. All PCI (J1850) communication faults must be resolved prior to further diagnosing any front control module related issues.

The front control module was designed to be diagnosed with an appropriate diagnostic scan tool, such as the DRB III®. The most reliable, efficient, and accurate means to diagnose the front control module

FRONT CONTROL MODULE (Continued)

requires the use of a DRB III® scan tool and the proper Body Diagnostic Procedures manual.

Before any testing of the front control module is attempted, the battery should be fully charged and all wire harness and ground connections inspected around the affected areas on the vehicle.

REMOVAL

(1) Disconnect the positive and negative battery cables from the battery.

(2) Partially remove the integrated power module from the engine compartment (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - REMOVAL).

(3) Remove the front control module retaining screws.

(4) Using both hands, pull the front control module **straight** from the integrated power module assembly to disconnect the 49-way electrical connector and remove the front control module from the vehicle.

INSTALLATION

(1) Install the front control module on the integrated power module assembly by pushing the 49-way electrical connector straight in.

(2) Install the front control module retaining screws. Torque the screws to 7 in. lbs.

(3) Install the integrated power module (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - INSTALLATION).

(4) Connect the positive and negative battery cables.

IOD FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Integrated Power Module when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the Integrated Power Module as part of the preparation procedures performed just prior to new vehicle delivery.

A laser printed fuse layout map is integral to the Integrated Power Module cover to ensure proper fuse identification. The IOD fuse is a 20 ampere mini blade-type fuse, located in fuse cavity # 51 (Fig. 6). The fuse is secured within a black molded plastic fuse holder and puller unit that serves both as a tool for disconnecting and reconnecting the fuse in its Integrated Power Module cavity, and as a fuse holder that conveniently stores the fuse in the same Integrated Power Module cavity after it has been disconnected.

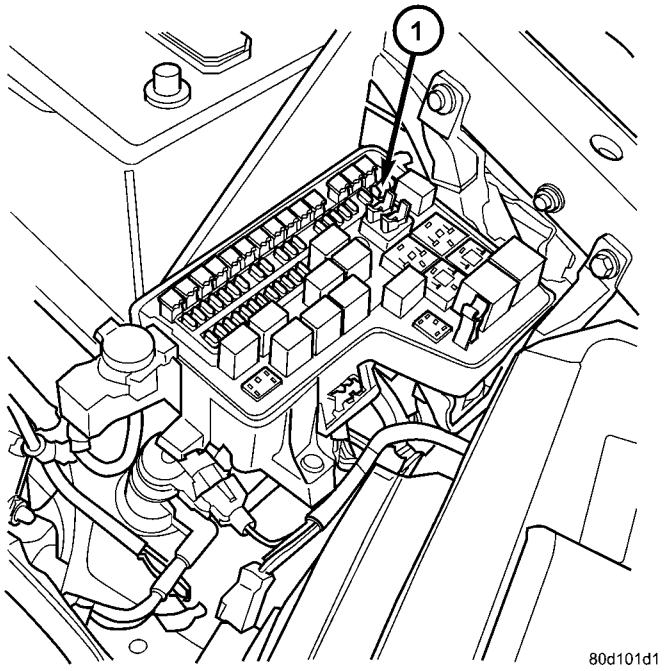

Fig. 6 IOD FUSE LOCATION

1 - IOD FUSE

CIRCUITS INCLUDED WITH IOD FUSE

- Cluster (CCN)
- Diagnostic Connector
- Map Lamps
- Glove Box Lamp
- Courtesy Lamps
- Radio
- Underhood Lamp

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from Integrated Power Module fuse cavity # 51 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse

IOD FUSE (Continued)

becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

REMOVAL

The Ignition-Off Draw (IOD) fuse is disconnected from Integrated Power Module fuse cavity # 51 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

(1) Turn the ignition switch to the Off position.

(2) Remove the Integrated Power Module cover.

(3) Grasp the outer tabs of the IOD fuse holder unit in fuse cavity # 51 between the thumb and forefinger and pull the unit firmly upward.

(4) Install the Integrated Power Module cover.

INSTALLATION

(1) Turn the ignition switch to the Off position.

(2) Remove the Integrated Power Module cover.

(3) To install the IOD fuse, use a thumb to press the IOD fuse holder unit in fuse cavity # 51 firmly into the Integrated Power Module.

(4) Install the Integrated Power Module cover.

POWER OUTLET

DESCRIPTION

Two power outlets are utilized on this model. One in the instrument panel center lower bezel and the other in the center console. The power outlet bases are secured by a snap fit within the instrument panel or trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the integrated power module at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

DIAGNOSIS AND TESTING - POWER OUTLET

For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Check the fused B(+) fuse in the integrated power module. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the integrated power module. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.

(3) Remove the plastic protective cap from the power outlet receptacle. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the power outlet receptacle from the instrument panel. Disconnect the wire harness connector from the power outlet receptacle. Check for continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the integrated power module fuse as required.

POWER OUTLET (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the cigar lighter knob and element out of the cigar lighter receptacle base, or unsnap the protective cap from the power outlet receptacle base.

(3) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the panel (Fig. 7).

(4) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

(6) Pull the receptacle base away from the instrument panel far enough to access the instrument panel wire harness connector.

(7) Disconnect the instrument panel wire harness connector from the cigar lighter or power outlet receptacle base connector receptacle.

(8) Remove the cigar lighter or power outlet mount from the instrument panel.

INSTALLATION

(1) Reconnect the instrument panel wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.

(2) Install the cigar lighter or power outlet mount into the instrument panel.

(3) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(4) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

ENGINE - 3.7L

DESCRIPTION

The 3.7 liter (226 CID) six-cylinder engine is an 90° single overhead camshaft engine (Fig. 1). The cast iron cylinder block is made up of two different components; the first component is the cylinder bore and upper block, the second component is the bedplate that comprises the lower portion of the cylinder block and houses the lower half of the crankshaft main bearings. The cylinders are numbered from front to rear with the left bank being numbered 1,3, and 5 and the right bank being numbered 2,4, and 6. The firing order is 1–6–5–4–3–2. The engine serial number is located at the right front side of the engine block

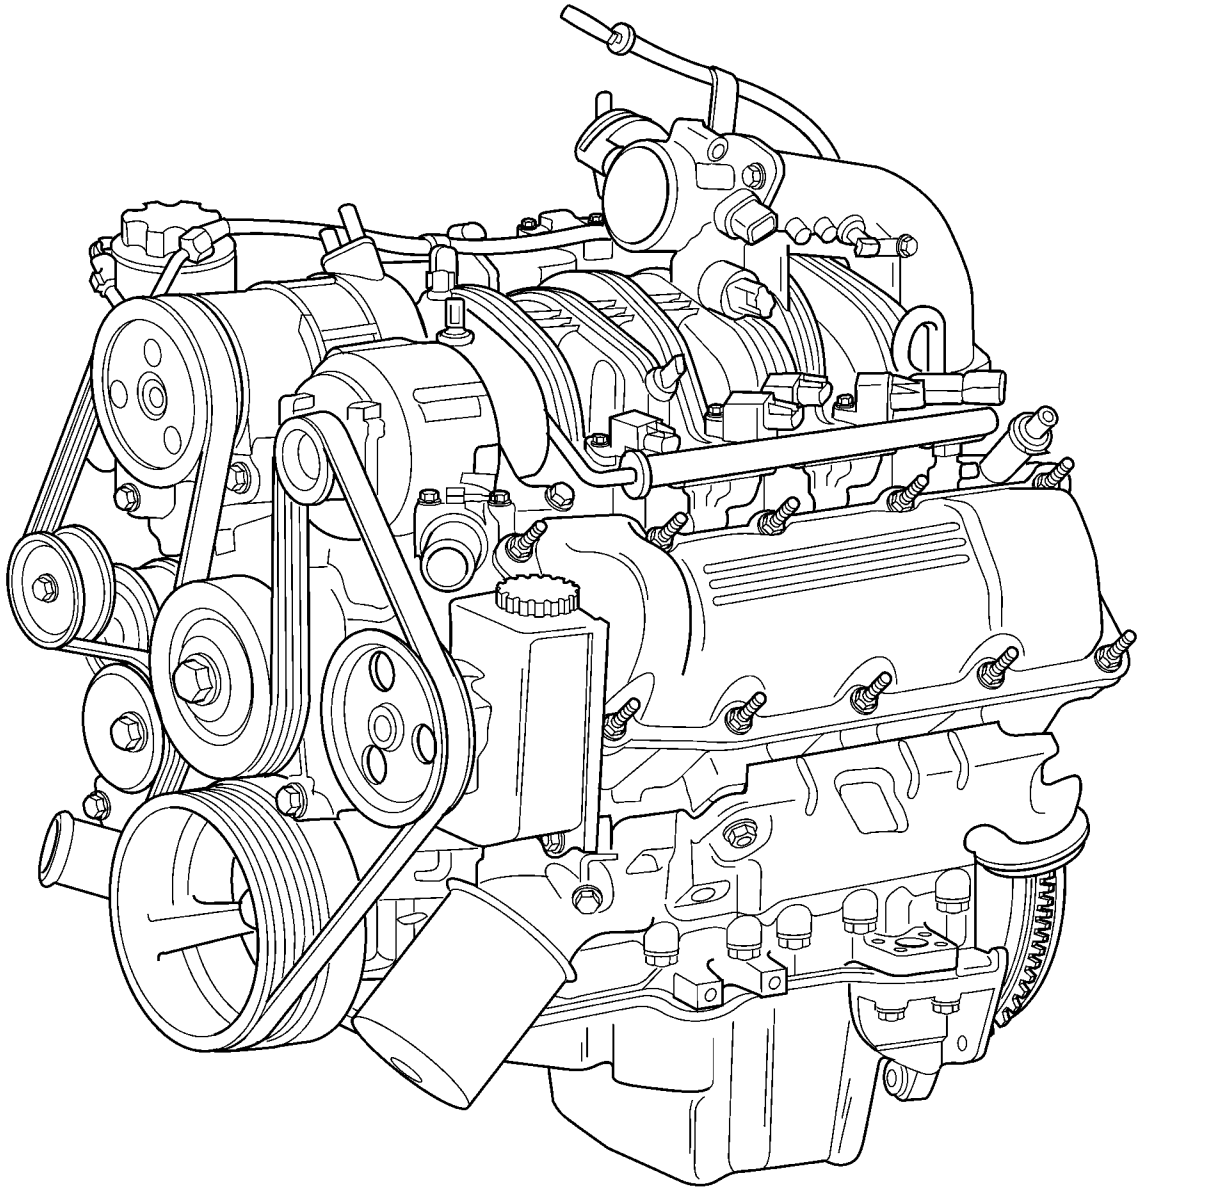

Fig. 1 3.7 L ENGINE

ENGINE - 3.7L (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE

DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) - PERFORMANCE and (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—MECHANICAL for possible causes and corrections of malfunctions. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING) and (Refer to 14 - FUEL SYSTEM/FUEL INJECTION - DIAGNOSIS AND TESTING) for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Engine Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING).
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery	1. Charge or replace as necessary.
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals.
	3. Faulty starter.	3. (Refer to 8 - ELECTRICAL/ STARTING - DIAGNOSIS AND TESTING).
	4. Faulty coil or control unit.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	5. Incorrect spark plug gap.	5. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	6. Incorrect right bank cam timing.	6. Refer to engine timing in this section.
	7. Dirt or water in fuel system.	7. Clean system and replace fuel filter.
	8.Faulty fuel pump, relay or wiring.	8.Repair or replace as necessary.
	9. Faulty cam or crank sensor	9. Refer to Ignition system.
ENGINE STALLS OR ROUGH IDLE	1. Vacuum leak.	1. Inspect intake manifold and vacuum hoses, repair or replace as necessary.
	2. Faulty crank position sensor	2. Replace crank position sensor.
	3. Faulty coil.	3. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).

ENGINE - 3.7L (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
	4. Incorrect cam timing.	4. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
1. ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Dirt or water in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL PUMP - DIAGNOSIS AND TESTING).
	4. Blown cylinder head gasket.	4. Replace cylinder head gasket.
	5. Low compression.	5. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), repair as necessary.
	6. Burned, warped or pitted valves.	6. Replace as necessary.
	7. Plugged or restricted exhaust system.	7. Inspect and replace as necessary.
	8. Faulty coil.	8. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	9. Incorrect cam timing.	9. Refer to Engine TIming in this section.
1. ENGINE MISSES ON ACCELERATION	1. Spark plugs dirty or incorrectly gapped.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Dirt in fuel system.	2. Clean fuel system.
	3. Burned, warped or pitted valves.	3. Replcae as necessary.
	4. Faulty coil.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
1. ENGINE MISSES AT HIGH SPEED	1. Spark plugs dirty or incorrectly gapped.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Faulty coil.	2. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	3. Dirt or water in fuel system.	3. Clean system and replace fuel filter.

ENGINE - 3.7L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE)
	8. Excessive runout of valve seats on valve faces.	8. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE)
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of round.	6. Service or replace crankshaft.
	7. Loose flywheel or torque converter.	7. Tighten to correct torque

ENGINE - 3.7L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-Rings.	1.
	(a) Misaligned or damaged.	(a) Replace as necessary.
	(b) Loose fasteners, broken or porous metal parts.	(b) Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear seal	2. Replace as necessary (Refer to 9 - ENGINE/ENGINE BLOCK/ CRANKSHAFT OIL SEAL - REAR - REMOVAL).
	3. Crankshaft seal flange. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
	5. Timing chain cover seal, damaged or misaligned.	5. Replace seal (Refer to 9 - ENGINE/ENGINE BLOCK/ CRANKSHAFT OIL SEAL - FRONT - REMOVAL).
	6. Scratched or damaged vibration damper hub.	6. Polish or replace damper.
OIL PRESSURE DROP	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure sending unit.	2. Replace sending unit (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL).
	3. Low oil pressure.	3. Check oil pump and bearing clearance.
	4. Clogged oil filter.	4. Replace oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
	5. Worn oil pump.	5. Replace oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
	6. Thin or diluted oil.	6. Change oil and filter.
	7. Excessive bearing clearance.	7. Replace as necessary.
	8. Oil pump relief valve stuck.	8. Replace oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
	9. Oil pick up tube loose, damaged or clogged.	9. Replace as necessary.

ENGINE - 3.7L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings.
	2. Carbon in oil ring slots.	2. Replace rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).
	3. Incorrect ring size installed.	3. Replace rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).
	4. Worn valve guides.	4. Ream guides and replace valves (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
	5. Leaking valve guide seals.	5. Replace valve guide seals.

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs.

(3) Disable the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DESCRIPTION).

(4) Remove the ASD relay (Refer to 8 - ELECTRICAL/IGNITION CONTROL/AUTO SHUT DOWN RELAY - REMOVAL).

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

(7) (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner hose.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression,While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

STANDARD PROCEDURE

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage

of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 2)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 2)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 2)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

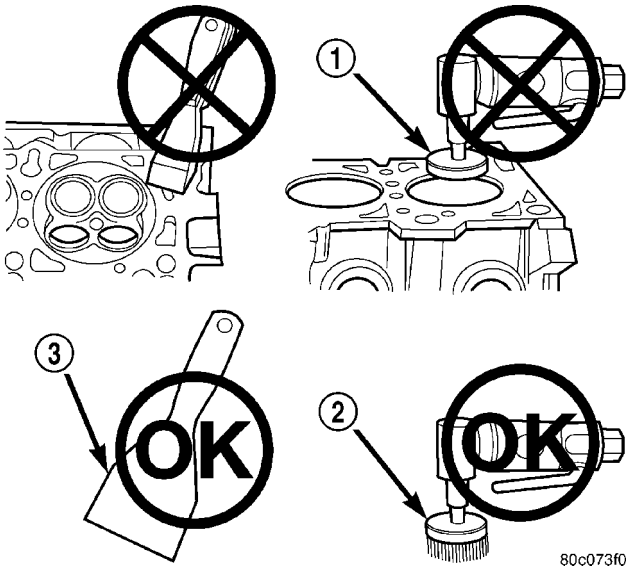

Fig. 2 Proper Tool Usage For Surface Preparation

1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

REMOVAL

(1) Disconnect the battery negative cable.

(2) Remove hood. Mark hood hinge location for reinstallation.

(3) Remove air cleaner assembly.

(4) Remove radiator core support bracket.

(5) Remove fan shroud with viscous fan assembly.

(6) Remove drive belt.

(7) Remove A/C compressor and secure away from engine.

(8) Remove generator and secure away from engine.

NOTE: Do NOT remove the phenolic pulley from the P/S pump. It is not required for P/S pump removal.

(9) Remove power steering pump with lines attached and secure away from engine.

(10) Drain cooling system.

(11) Disconnect the heater hoses from the engine.

ENGINE - 3.7L (Continued)

(12) Disconnect heater hoses from heater core and remove hose assembly.
(13) Disconnect throttle and speed control cables.
(14) Remove upper radiator hose from engine.
(15) Remove lower radiator hose from engine.
(16) Remove radiator/cooling module assembly.
(17) Disconnect the engine to body ground straps at the left side of cowl.
(18) Disconnect the engine wiring harness at the following points:

- Intake air temperature (IAT) sensor
- Fuel Injectors
- Throttle Position (TPS) Switch
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs
- Crankshaft Position Sensor

(19) Remove coil over plugs.
(20) Release fuel rail pressure.
(21) Remove fuel rail and secure away from engine.

NOTE: It is not necessary to release the quick connect fitting from the fuel supply line for engine removal.

(22) Remove the PCV hose.
(23) Remove the breather hoses.
(24) Remove the vacuum hose for the power brake booster.
(25) Disconnect knock sensors.
(26) Remove engine oil dipstick tube.
(27) Remove intake manifold.
(28) Install engine lifting fixture,special tool#8247, using original fasteners from the removed intake manifold, and fuel rail. Torque to factory specifications.

NOTE: Recheck bolt torque for engine lift plate before removing engine.

(29) Secure the left and right engine wiring harnesses away from engine.
(30) Raise vehicle.
(31) Disconnect oxygen sensor wiring.
(32) Disconnect crankshaft postion sensor.
(33) Disconnect the engine block heater power cable, if equipped.
(34) Disconnect the front propshaft at the front differential and secure out of way.

NOTE: It is necessary to disconnect the front propshaft for access to the starter and left side exhaust flange.

(35) Remove the starter.
(36) Remove the ground straps from the left and right side of the block.
(37) Disconnect the right and left exhaust pipes at the manifolds and from the crossover, and remove from the vehicle.

NOTE: The exhaust clamps at the manifolds cannot be reused. New clamps must be used or leaks may occur.

(38) Remove the structural cover.
(39) Remove torque convertor bolts, and mark location for reassembly.
(40) Remove transmission bellhousing to engine bolts.
(41) Remove left and right engine mount thru bolts.
(42) Lower the vehicle.
(43) Support the transmission with a suitable jack.
(44) Connect a suitable engine hoist to the engine lift plate.
(45) Remove engine from vehicle.

INSTALLATION

(1) Position the engine in the vehicle.
(2) Install both left and right side engine mounts onto engine.
(3) Raise the vehicle.
(4) Install the transmission bellhousing to engine mounting bolts. Tighten the bolts to 41 N·m (30ft. lbs.).
(5) Tighten the engine mount thru bolts.
(6) Install the torque convertor bolts.
(7) Connect the ground straps on the left and right side of the engine.
(8) Install the starter.
(9) Connect the crankshaft position sensor.
(10) Install the engine block heater power cable, if equipped.

CAUTION: The structural cover requires a specific torque sequence. Failure to follow this sequence may cause severe damage to the cover.

(11) Install the structural cover.

NOTE: New clamps must be used on exhaust manifold flanges. Failure to use new clamps may result in exhaust leaks.

(12) Install the left and right exhaust pipes.
(13) Connect the left and right oxygen sensors.
(14) Lower vehicle.
(15) Remove the engine lift plate.
(16) Connect the knock sensors.

(17) Connect the engine to body ground straps at the left side of the cowl.
(18) Install the intake manifold.
(19) Install the engine oil dipstick tube.
(20) Install the power brake booster vacuum hose.
(21) Install the breather hoses.
(22) Install the PCV hose.
(23) Install the fuel rail.
(24) Install the coil over plugs.
(25) Connect the engine wiring harness at the following points:

- Intake air temperature (IAT) sensor
- Fuel Injectors
- Throttle Position (TPS) Switch
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs
- Crankshaft Position Sensor

(26) Reinstall the radiator/cooling module assembly.
(27) Connect lower radiator hose.
(28) Connect upper radiator hose.
(29) Connect throttle and speed control cables.
(30) Install the heater hose assembly.
(31) Install coolant recovery bottle.
(32) Install the power steering pump.
(33) Install the generator.
(34) Install the A/C compressor.
(35) Install the drive belt.
(36) Install the fan shroud with the viscous fan assembly.
(37) Install the radiator core support bracket.
(38) Install the air cleaner assembly.
(39) Refill the engine cooling system.
(40) Recharge the air conditioning.
(41) Install the hood.
(42) Check and fill engine oil.
(43) Connect the battery negative cable.
(44) Start the engine and check for leaks.

ENGINE SUPPORT FIXTURE 8534

AIR CLEANER ELEMENT

REMOVAL

Filter Element Only

Housing removal is not necessary for element (filter) replacement.

(1) Loosen clamp (Fig. 3) and disconnect air duct at air cleaner cover.

(2) Pry over 4 spring clips (Fig. 3) from housing cover (spring clips retain cover to housing).

(3) Release housing cover from locating tabs on housing (Fig. 3) and remove cover.

(4) Remove air cleaner element (filter) from housing.

(5) Clean inside of housing before replacing element.

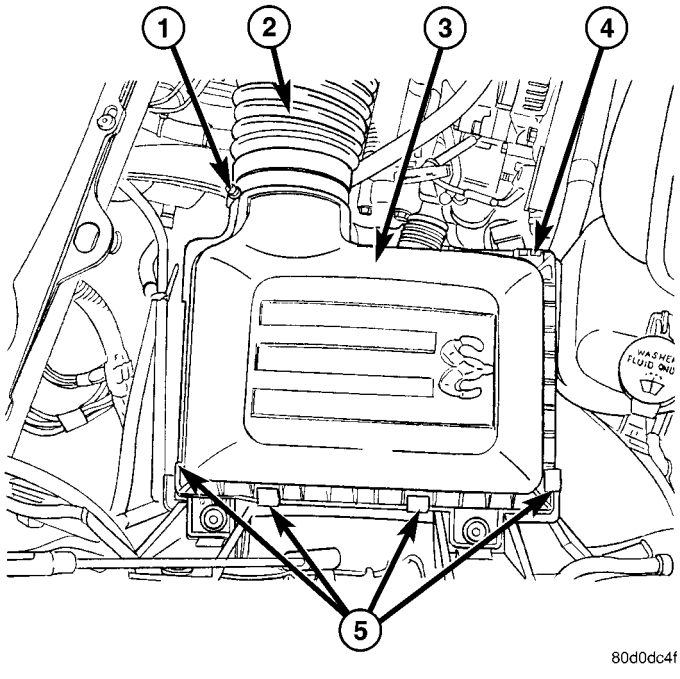

Fig. 3 AIR CLEANER HOUSING COVER

1 - CLAMP
2 - AIR DUCT
3 - AIR CLEANER COVER
4 - LOCATING TABS
5 - CLIPS (4)

Housing Assembly

(1) Loosen clamp (Fig. 3) and disconnect air duct at air cleaner cover.

(2) Lift entire housing assembly from 4 locating pins (Fig. 4).

INSTALLATION

(1) Install filter element into housing.

(2) Position housing cover into housing locating tabs (Fig. 3).

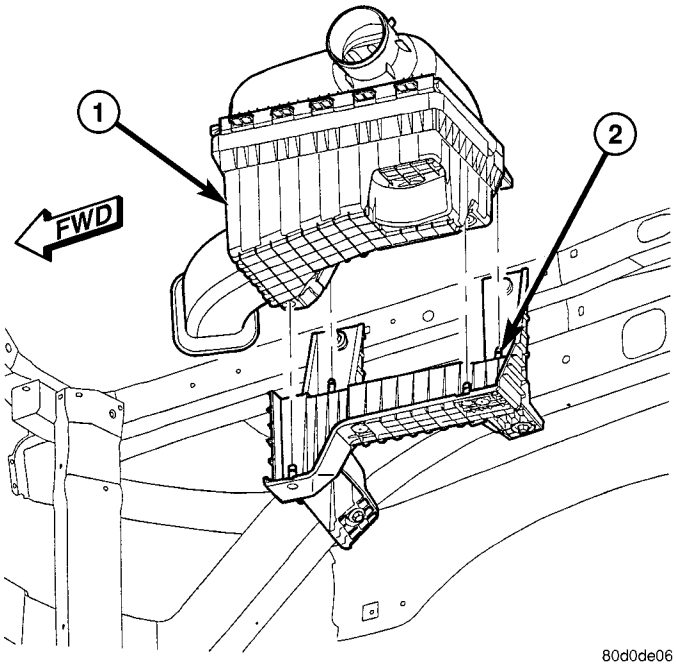

Fig. 4 AIR CLEANER HOUSING

1 - AIR CLEANER HOUSING ASSEMBLY
2 - LOCATING PINS (4)

(3) Pry up 4 spring clips (Fig. 3) and lock cover to housing.

(4) Install air duct to air cleaner cover and tighten hose clamp to 3 N·m (30 in. lbs.) torque.

(5) If any other hose clamps were removed from air intake system, tighten them to 3.4 N·m (30 in. lbs.) torque.

(6) If any bolts were removed from air resonator housing or air intake tubing, tighten them to 4.5 N·m (40 in. lbs.) torque.

CYLINDER HEAD - LEFT

DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant

CYLINDER HEAD - LEFT (Continued)

- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Raise the vehicle on a hoist.

(3) Disconnect the exhaust pipe at the left side exhaust manifold.

(4) Drain the engine coolant(Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Lower the vehicle.

(6) Remove the intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(7) Remove the master cylinder and booster assembly(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - REMOVAL).

(8) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(9) Remove the fan shroud and fan blade assembly(Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(10) Remove accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(11) Remove the power steering pump and set aside.

(12) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 5).

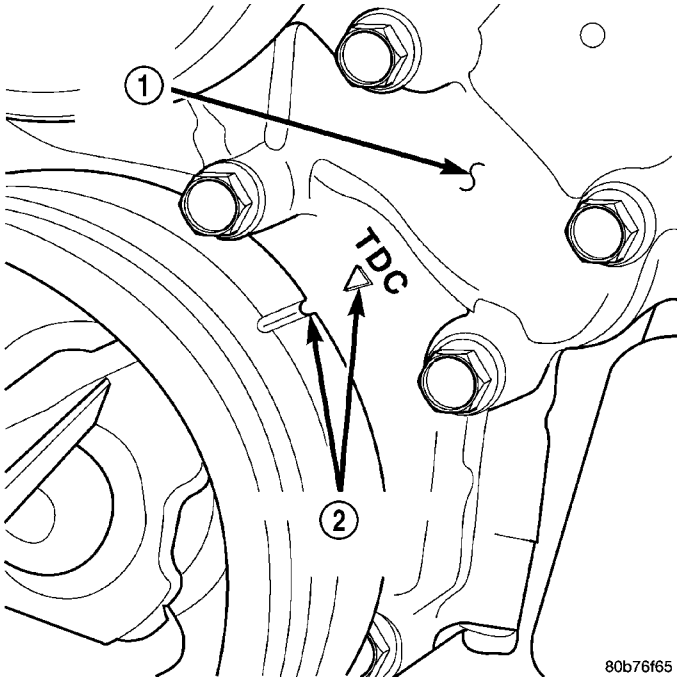

Fig. 5 Engine Top Dead Center

1 - TIMING CHAIN COVER
2 - CRANKSHAFT TIMING MARKS

(13) Verify the V6 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 6). Rotate the crankshaft one turn if necessary.

(14) Remove the crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(15) Remove the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

CYLINDER HEAD - LEFT (Continued)

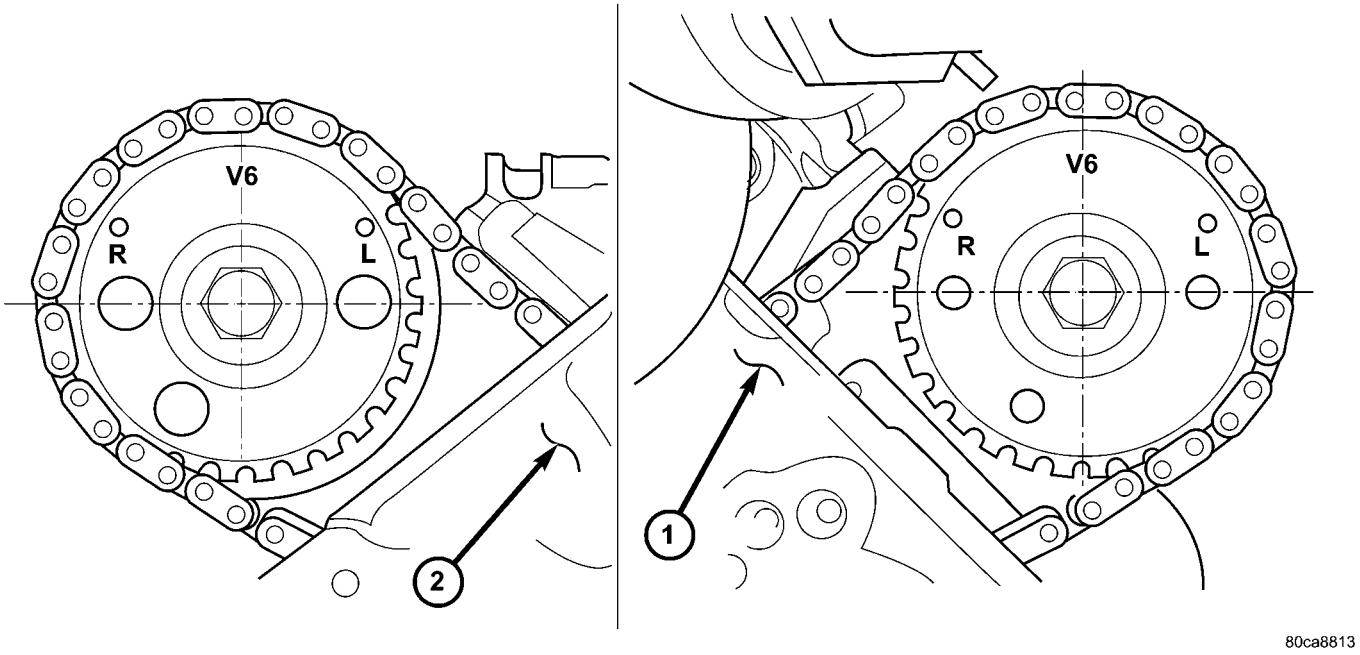

Fig. 6 CAMSHAFT SPROCKET V6 MARKS (#1 TDC, Exhaust stroke)

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

(16) Lock the secondary timing chains to the idler sprocket using Special Tool 8429 Timing Chain Holding Fixture (Fig. 7).

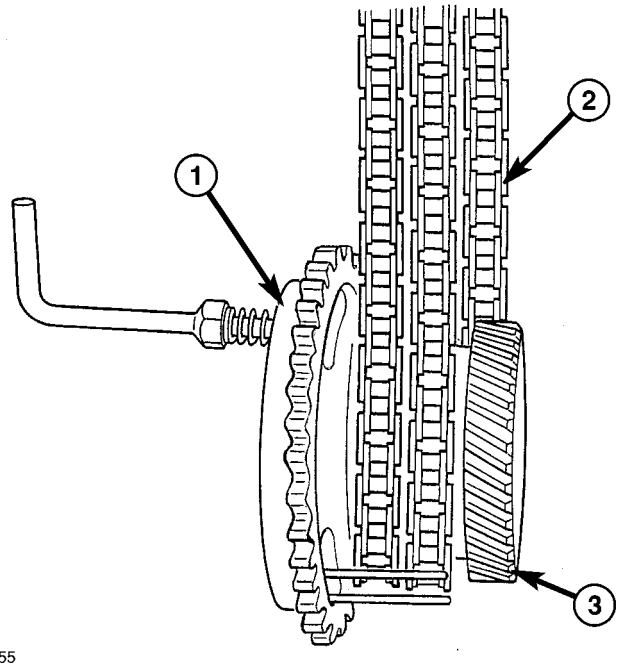

Fig. 7 Using Special Tool 8429

1 - SPECIAL TOOL 8429
2 - CAMSHAFT CHAIN
3 - CRANKSHAFT TIMING GEAR

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

(17) Mark the secondary timing chain, one link on each side of the V6 mark on the camshaft drive gear.

(18) Remove the left side secondary chain tensioner. Refer to Timing Chain and Sprockets.

(19) Remove the cylinder head access plug (Fig. 8).

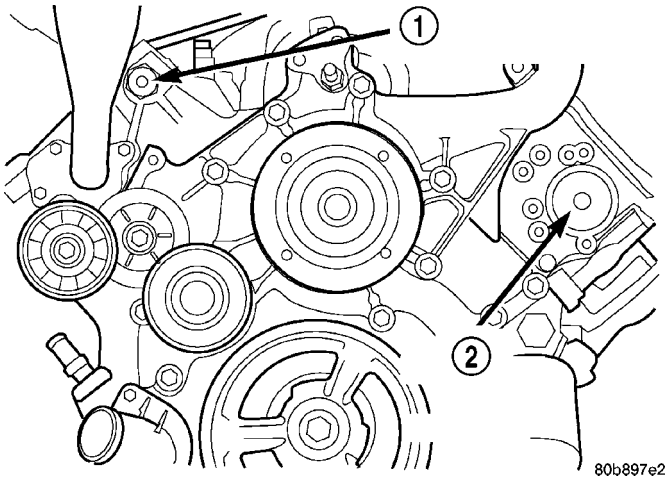

Fig. 8 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

CYLINDER HEAD - LEFT (Continued)

(20) Remove the left side secondary chain guide(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(21) Remove the retaining bolt and the camshaft drive gear.

CAUTION: Do not allow the engine to rotate. Severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

NOTE: The cylinder head is attached to the cylinder block with twelve bolts.

(22) Remove the cylinder head retaining bolts.

(23) Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

INSTALLATION

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 9).

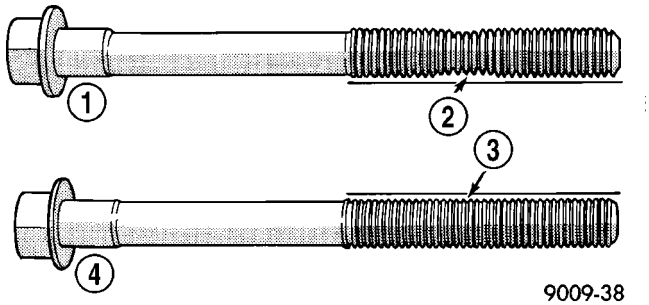

Fig. 9 Checking Cylinder Head Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Fig. 10).

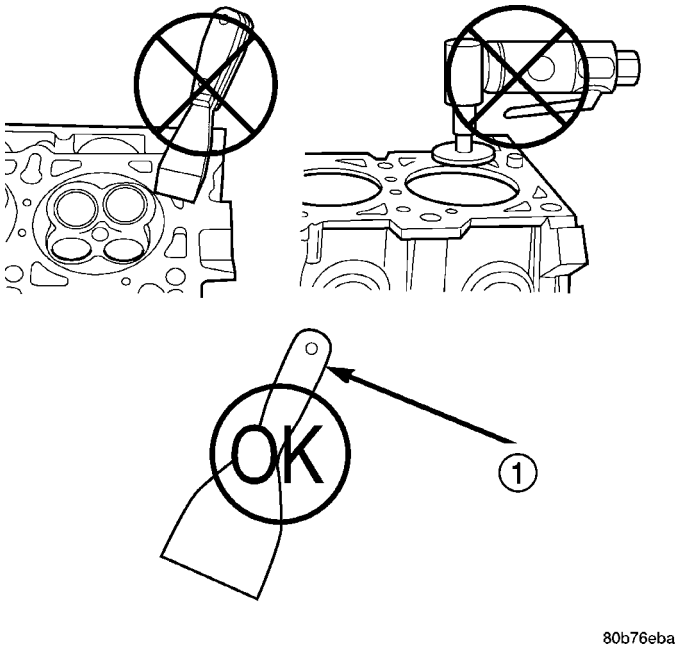

Fig. 10 Proper Tool Usage For Surface Preparation

1 - PLASTIC/WOOD SCRAPER

(2) Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the eight M11 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar® Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

(6) Tighten the bolts in sequence using the following steps and torque values:

CYLINDER HEAD - LEFT (Continued)

- Step 1: Tighten bolts 1-8, 27 N·m (20 ft. lbs.).
- Step 2: Verify that bolts 1-8, all reached 27 N·m (20 ft. lbs.), by repeating step 1 without loosening the bolts. Tighten bolts 9 thru 12 to 14 N·m (10 ft. lbs.).
- Step 3: Tighten bolts 1-8, 90 degrees (Fig. 11).
- Step 4: Tighten bolts 1-8, 90 degrees, again. Tighten bolts 9-12, 26 N·m (19 ft. lbs.)

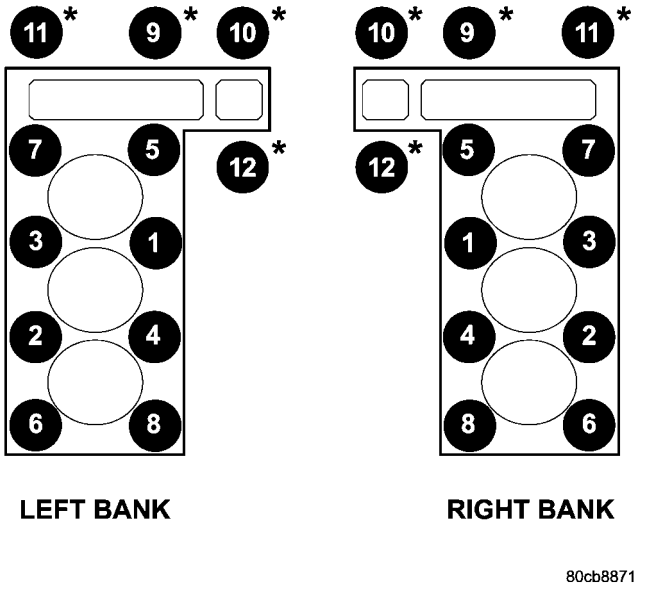

Fig. 11 Cylinder head Tightening Sequence

* - INDICATES SEALANT ON THREADS

(7) Position the secondary chain onto the camshaft drive gear, making sure one marked chain link is on either side of the V6 mark on the gear then using Special Tool 8428 Camshaft Wrench, position the gear onto the camshaft.

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.

(8) Install the camshaft drive gear retaining bolt.

(9) Install the left side secondary chain guide(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/ CHAIN AND SPROCKETS - INSTALLATION).

(10) Install the cylinder head access plug.

(11) Re-set and install the left side secondary chain tensioner(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(12) Remove Special Tool 8429.

(13) Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(14) Install the crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION). Tighten damper bolt 175 N·m (130 Ft. Lbs.).

(15) Install the power steering pump.

(16) Install the fan blade assembly and fan shroud(Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(17) Install the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(18) Install the master cylinder and booster assembly(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - INSTALLATION).

(19) Install the intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(20) Refill the cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Raise the vehicle.

(22) Install the exhaust pipe onto the left exhaust manifold.

(23) Lower the vehicle.

(24) Connect the negative cable to the battery.

(25) Start the engine and check for leaks.

CAMSHAFT(S)

DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

REMOVAL

CAUTION: When the timing chain is removed and the cylinder heads are still installed, DO NOT forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use Special Tool 8379 will result in hydraulic tensioner ratchet over extension, requiring timing chain cover removal to reset the tensioner ratchet.

(1) Remove cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

CAMSHAFT(S) (Continued)

(2) Set engine to TDC cylinder #1, camshaft sprocket V6 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V6 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel (Located on the right side camshaft sprocket) for any reason, Severe damage will occur to the target wheel resulting in a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave the bolt snug against the sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8379 timing chain wedge between the timing chain strands, tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 12).

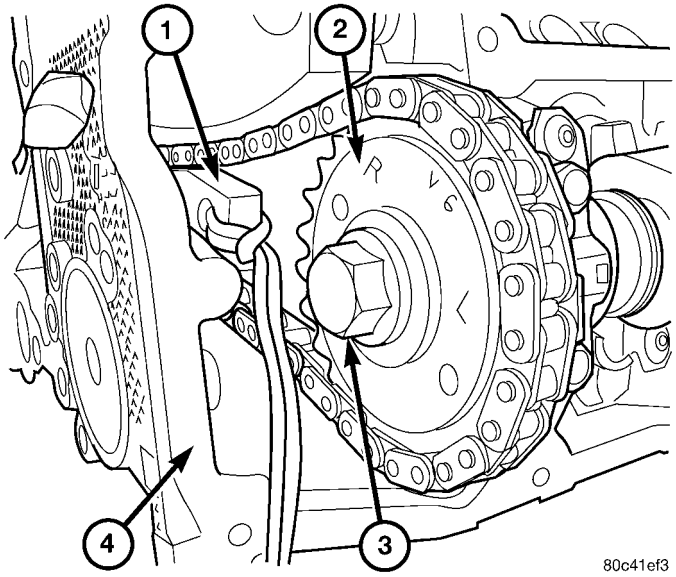

Fig. 12 SECURING TIMING CHAIN TENSIONERS USING TIMING CHAIN WEDGE - Typical

1 - SPECIAL TOOL 8379
2 - CAMSHAFT SPROCKET
3 - CAMSHAFT SPROCKET BOLT
4 - CYLINDER HEAD

(6) Hold the camshaft with Special Tool 8428 Camshaft Wrench, while removing the camshaft sprocket bolt and sprocket (Fig. 13).

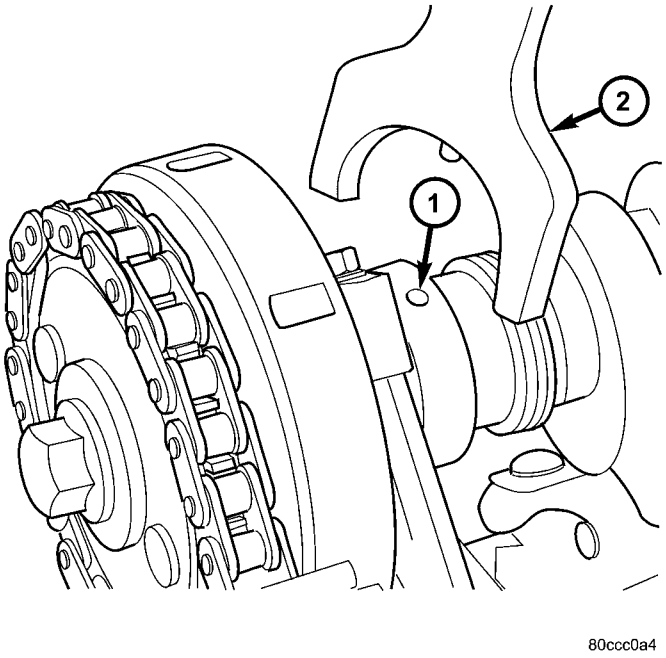

Fig. 13 Special Tool 8428

1 - Camshaft hole
2 - Special Tool 8428

(7) Using Special Tool 8428 Camshaft Wrench, gently allow the camshaft to rotate 5° clockwise until the camshaft is in the neutral position (no valve load).

(8) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

(9) Remove the camshaft bearing caps and the camshaft.

CAMSHAFT(S) (Continued)

INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

NOTE: Position the left side camshaft so that the camshaft sprocket dowel is near the 1 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

NOTE: Caps should be installed so that the stamped numbers on the caps are in numerical order, (1 thru 4) from the front to the rear of the engine. All caps should be installed so that the stamped arrows on the caps point toward the front of the engine.

(4) Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 14).

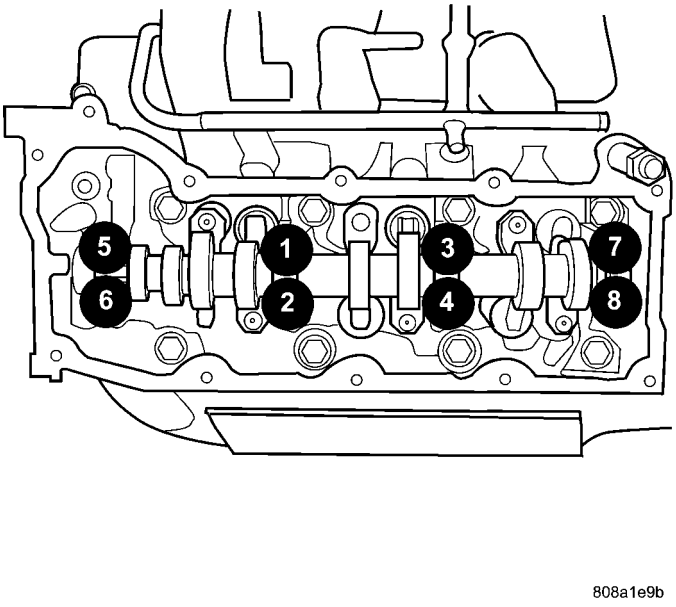

Fig. 14 CAMSHAFT BEARING CAPS TIGHTENING

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

(6) Position the camshaft drive gear into the timing chain aligning the V6 mark between the two marked chain links (Two links marked during removal).

(7) Using Special Tool 8428 Camshaft Wrench, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft.

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt overtorque resulting in bolt failure.

(8) Remove excess oil from bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove Special Tool 8379 timing chain wedge.

(10) Using Special Tool 6958 spanner wrench with adapter pins 8346, torque the camshaft sprocket retaining bolt to 122 N·m (90 ft. lbs.).

(11) Install the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

CYLINDER HEAD COVER(S)

DESCRIPTION

The cylinder head covers are made of single layer stamped steel, and are not interchangable from side-to-side (Fig. 15).

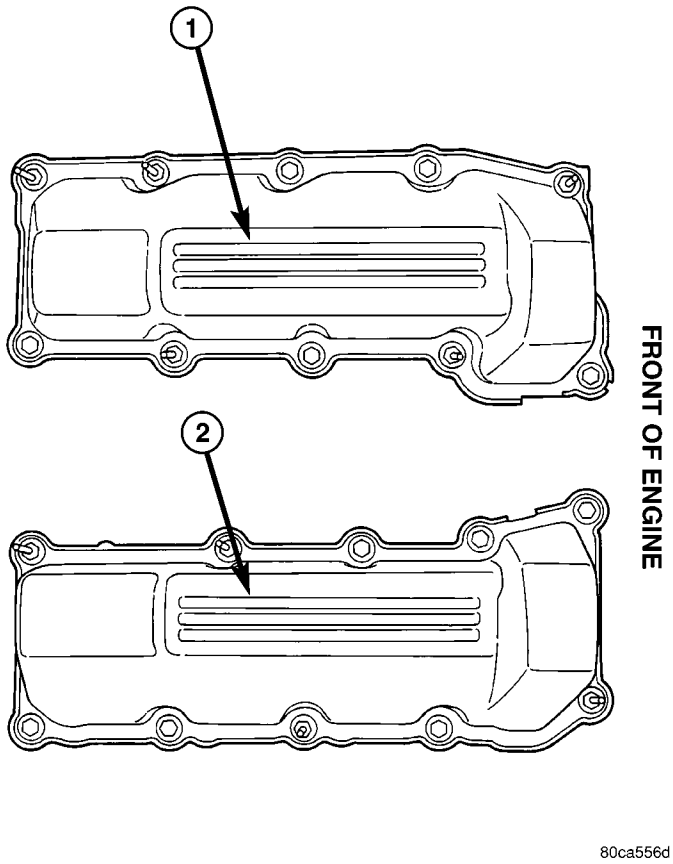

Fig. 15 CYLINDER HEAD COVERS

1 - LEFT SIDE CYLINDER HEAD COVER
2 - RIGHT SIDE CYLINDER HEAD COVER

CYLINDER HEAD COVER(S) (Continued)

REMOVAL

(1) Disconnect negative cable from battery.
(2) Remove the resonator assemble and air inlet hose.
(3) Disconnect injector connectors and un-clip the injector harness.
(4) Route injector harness in front of cylinder head cover.
(5) Disconnect the left side breather tube and remove the breather tube.
(6) Remove the cylinder head cover mounting bolts (Fig. 16).
(7) Remove cylinder head cover and gasket.

NOTE: The gasket may be used again, providing no cuts, tears, or deformation has occurred.

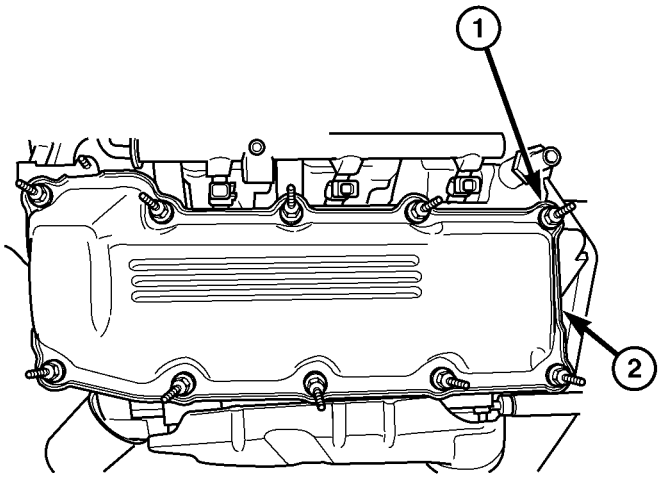

Fig. 16 CYLINDER HEAD COVER - TYPICAL

1 - SCREWS
2 - CYLINDER HEAD COVER

INSTALLATION

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
(2) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs.).
(3) Install left side breather and connect breather tube.
(4) Connect injector electrical connectors and injector harness retaining clips.
(5) Install the resonator and air inlet hose.
(6) Connect negative cable to battery.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE - REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(1) Using a suitable dial indicator measure the center of the valve seat Total run out must not exceed 0.051 mm (0.002 in).
(2) Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
(3) When the seat is properly positioned the width of the intake seat must be 1.75 - 2.36 mm (0.0689 - 0.0928 in.) and the exhaust seat must be 1.71 - 2.32 mm (0.0673 - 0.0911 in.).
(4) Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 40.74 mm (1.6039 in.).

INTAKE/EXHAUST VALVES & SEATS (Continued)

(5) The valve seat and valve face must maintain a face angle of 44.5 - 45 ° angle (Fig. 17).

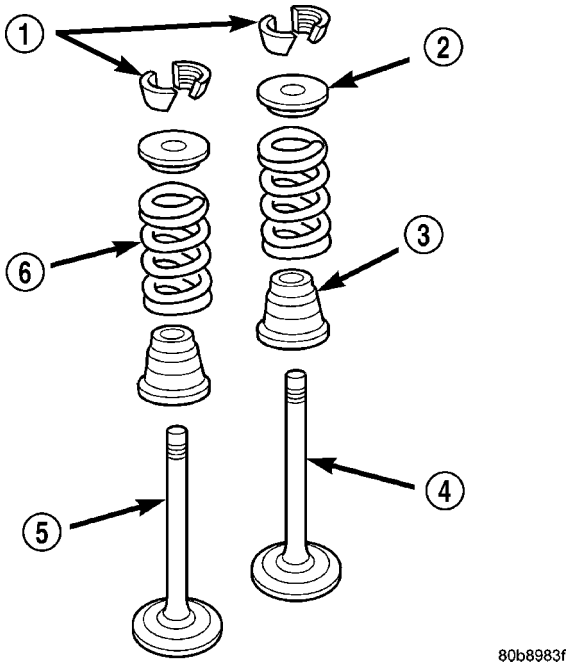

Fig. 17 Valve Assembly Configuration

1 - VALVE LOCKS (3–BEAD)
2 - RETAINER
3 - VALVE STEM OIL SEAL
4 - INTAKE VALVE
5 - EXHAUST VALVE
6 - VALVE SPRING

REMOVAL

NOTE: The cylinder heads must be removed in order to perform this procedure.

(1) Remove rocker arms and lash adjusters(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). (Fig. 18).
(2) Remove the camshaft bearing caps and the camshaft.

NOTE: All six valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

(3) Using Special Tool C-3422–B or C-3422–C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

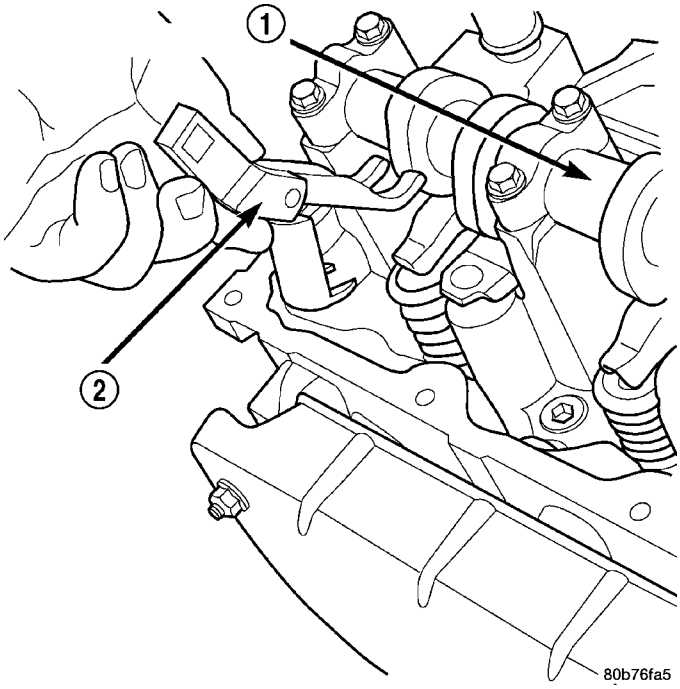

Fig. 18 Rocker Arm Removal

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(4) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(5) Remove the valve spring compressor.
(6) Remove the spring retainer, and the spring.

NOTE: Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

(7) Remove the valve from the cylinder head.

NOTE: The valve stem seals are common between intake and exhaust.

(8) Remove the valve stem seal. Mark the valve for proper installation.

INTAKE/EXHAUST VALVES & SEATS (Continued)

TESTING VALVE SPRINGS

NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until a Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications (Fig. 19).

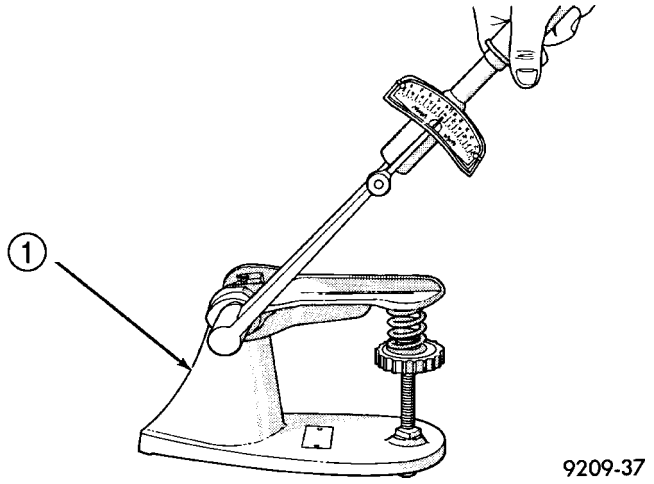

Fig. 19 Testing Valve Springs

1 - SPECIAL TOOL C-647

INSTALLATION

(1) coat the valve stem with clean engine oil and insert it into the cylinder head.

(2) Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.

(3) Install the spring and the spring retainer (Fig. 20).

(4) Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.

(5) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

(6) lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.

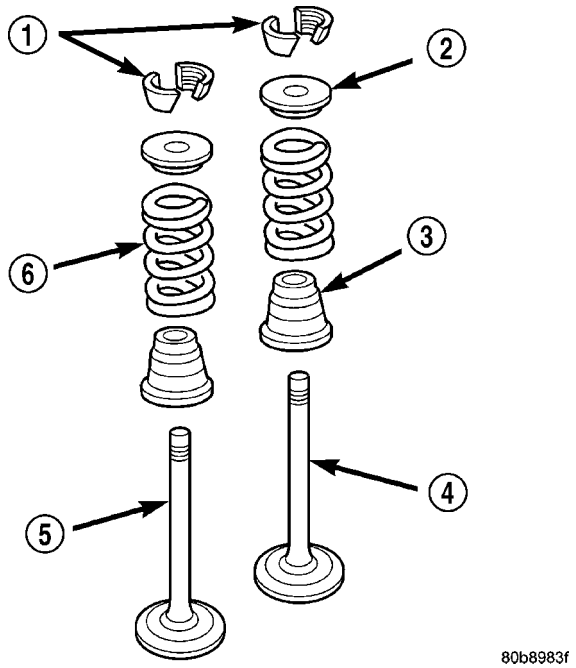

Fig. 20 Valve Assembly Configuration

1 - VALVE LOCKS (3–BEAD)
2 - RETAINER
3 - VALVE STEM OIL SEAL
4 - INTAKE VALVE
5 - EXHAUST VALVE
6 - VALVE SPRING

(7) Install the camshaft bearing cap retaining bolts. Tighten the bolts 9-13 N·m (100 in. lbs.) in 1/2 turn increments in the sequence shown (Fig. 21).

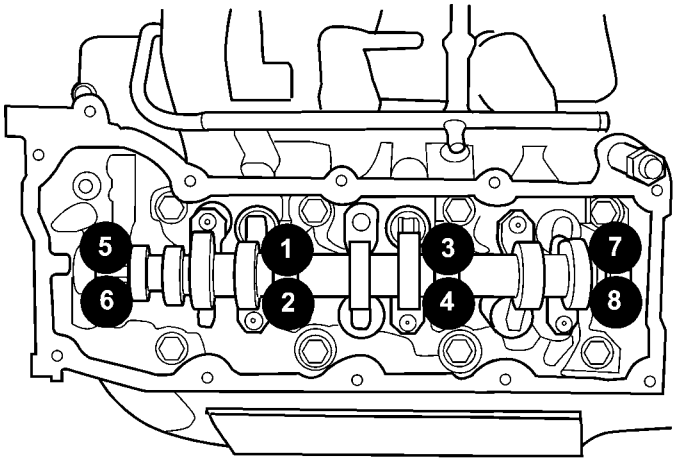

Fig. 21 Camshaft Bearing Caps Tightening Sequence

(8) Position the hydraulic lash adjusters and rocker arms(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

ROCKER ARM

DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8 mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

NOTE: Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(2) For rocker arm removal on cylinder No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
(3) For rocker arm removal on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.
(4) For rocker arm removal on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
(5) For rocker arm removal on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
(6) Using special tool 8516 Rocker Arm Remover, press downward on the valve spring, remove rocker arm (Fig. 22).

INSTALLATION

CAUTION: Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

NOTE: Coat the rocker arms with clean engine oil prior to installation.

(1) For rocker arm installation on cylinders No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
(2) For rocker arm installation on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.
(3) For rocker arm installation on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
(4) For rocker arm installation on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
(5) Using special tool 8516 press downward on the valve spring, install rocker arm (Fig. 23).

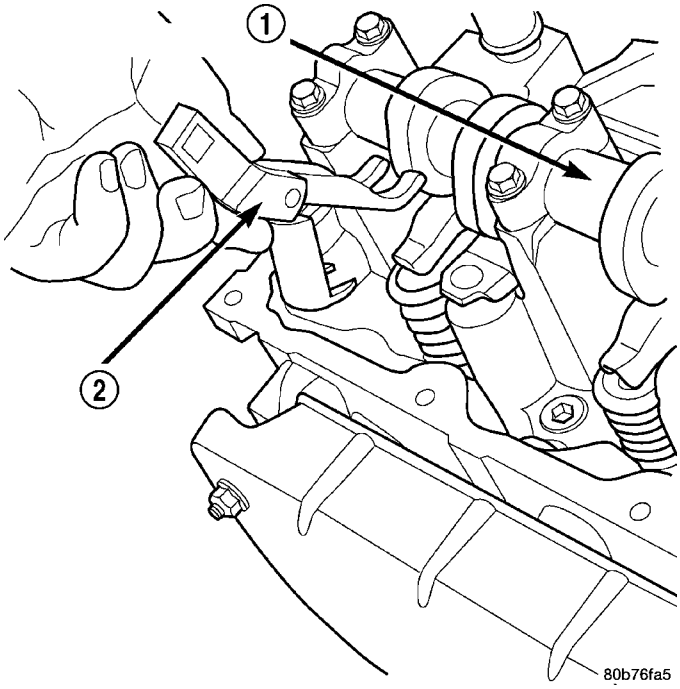

Fig. 22 Rocker Arm - Removal

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

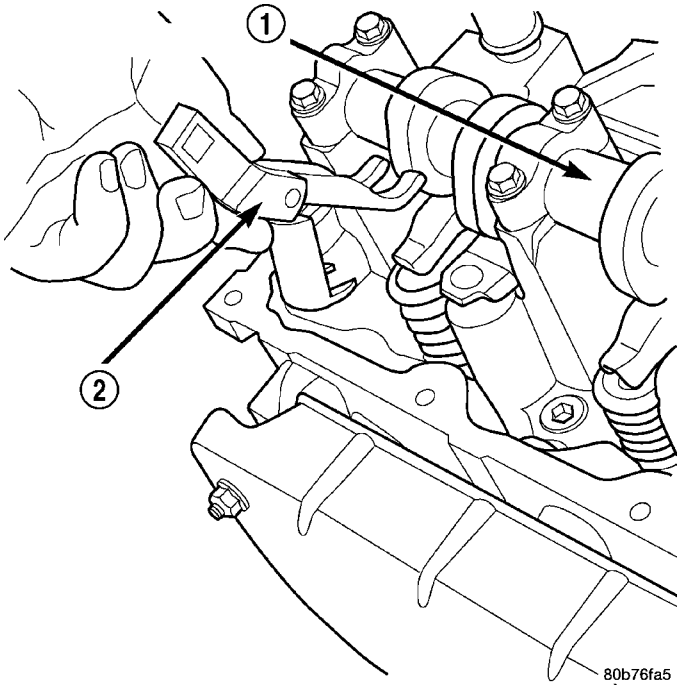

Fig. 23 Rocker Arm - Installation

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

(6) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVE GUIDE SEALS

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

VALVE SPRINGS

DESCRIPTION

The valve springs are made from high strength chrome silicon steel. The springs are NOT common for intake and exhaust applications. The exhaust spring has an external damper. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

REMOVAL

(1) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(2) Using Special Tool 8516 Valve Spring Compressor, remove the rocker arms and the hydraulic lash adjusters.
(3) Remove the spark plug for the cylinder the valve spring and seal are to be removed from.
(4) Apply shop air to the cylinder to hold the valves in place when the spring is removed.

NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

(5) Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(6) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(7) Remove the valve spring compressor.

NOTE: The valve springs are NOT common between intake and exhaust.

(8) Remove the spring retainer, and the spring.
(9) Remove the valve stem seal.

NOTE: The valve stem seals are common between intake and exhaust.

INSTALLATION

NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

(1) Apply shop air to the cylinder to hold the valves in place while the spring is installed.

NOTE: The valve stem seals are common between intake and exhaust.

(2) Install the valve stem seal.

NOTE: The valve springs are NOT common between intake and exhaust.

(3) Install the spring retainer, and the spring.
(4) Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.
(5) Install the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(6) Remove the valve spring compressor.
(7) Disconnect the shop air to the cylinder.
(8) Install the spark plug for the cylinder the valve spring and seal was installed on.
(9) Using Special Tool 8516 Valve Spring Compressor, install the rocker arms and the hydraulic lash adjusters.
(10) Install the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

CYLINDER HEAD - RIGHT

DIAGNOSIS AND TESTING - HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.
(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.
(3) Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
(4) Low oil pressure.
(5) The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.

CYLINDER HEAD - RIGHT (Continued)

(6) Air ingested into oil due to broken or cracked oil pump pick up.
(7) Worn valve guides.
(8) Rocker arm ears contacting valve spring retainer.
(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
(10) Oil leak or excessive cam bore wear in cylinder head.
(11) Faulty lash adjuster.
a. Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.
b. Remove suspected lash adjusters, and replace.
c. Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

REMOVAL

(1) Disconnect battery negative cable.
(2) Raise the vehicle on a hoist.
(3) Disconnect the exhaust pipe at the right side exhaust manifold.
(4) Drain the engine coolant(Refer to 7 - COOLING - STANDARD PROCEDURE).
(5) Lower the vehicle.
(6) Remove the intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(7) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
(8) Remove the fan shroud(Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(9) Remove oil fill housing from cylinder head.
(10) Remove accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(11) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark.
(12) Verify the V6 mark on the camshaft sprocket is at the 12 o'clock position. Rotate the crankshaft one turn if necessary.
(13) Remove the crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(14) Remove the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(15) Lock the secondary timing chains to the idler sprocket using Special Tool 8429 Timing Chain Holding Fixture.

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

(16) Mark the secondary timing chain, one link on each side of the V6 mark on the camshaft drive gear.
(17) Remove the right side secondary chain tensioner(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(18) Remove the cylinder head access plug.
(19) Remove the right side secondary chain guide(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

CAUTION: The nut on the right side camshaft sprocket should not be removed for any reason, as the sprocket and camshaft sensor target wheel is serviced as an assembly. If the nut was removed, torque nut to 5 N·m (44 in. lbs.).

(20) Remove the retaining bolt and the camshaft drive gear.

CAUTION: Do not allow the engine to rotate. severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

CAUTION: Do not hold or pry on the camshaft target wheel for any reason. A damaged target wheel can result in a vehicle no start condition.

NOTE: The cylinder head is attached to the cylinder block with twelve bolts.

(21) Remove the cylinder head retaining bolts.
(22) Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, do to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

CYLINDER HEAD - RIGHT (Continued)

INSTALLATION

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads (Fig. 24). If all the threads do not contact the scale, the bolt should be replaced.

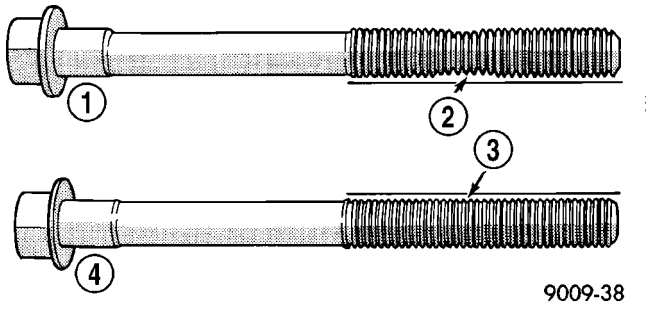

Fig. 24 Checking Cylinder Head Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Fig. 25).

(2) Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four M8 cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the eight M10 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

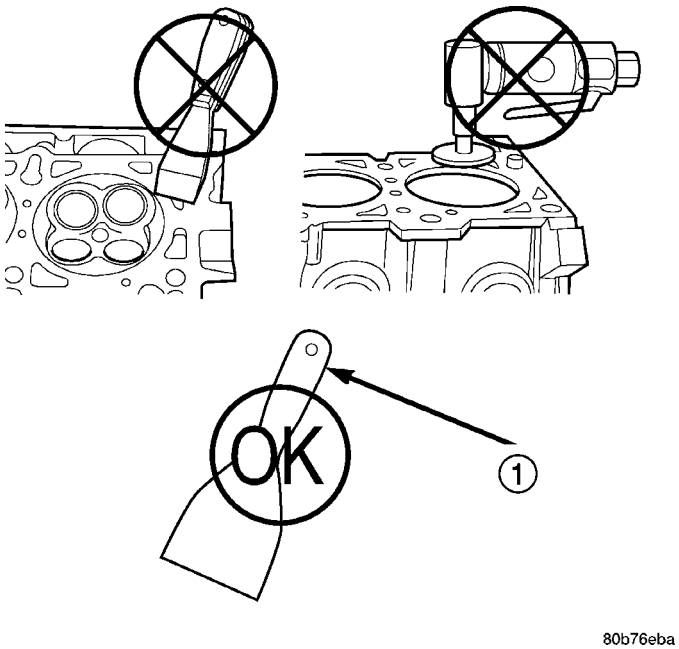

Fig. 25 Proper Tool Usage For Surface Preparation

1 - PLASTIC/WOOD SCRAPER

(6) Tighten the bolts in sequence using the following steps and torque values:

- Step 1: Tighten bolts 1-8, 27 N·m (20 ft. lbs.).
- Step 2: Verify that bolts 1-8, all reached 27 N·m (20 ft. lbs.), by repeating step 1 without loosening the bolts. Tighten bolts 9 thru 12 to 14 N·m (10 ft. lbs.).
- Step 3: Tighten bolts 1-8, 90 ° (Fig. 26).
- Step 4: Tighten bolts 1-8, 90 °, again. Tighten bolts 9-12, 26 N·m (19 ft. lbs.)

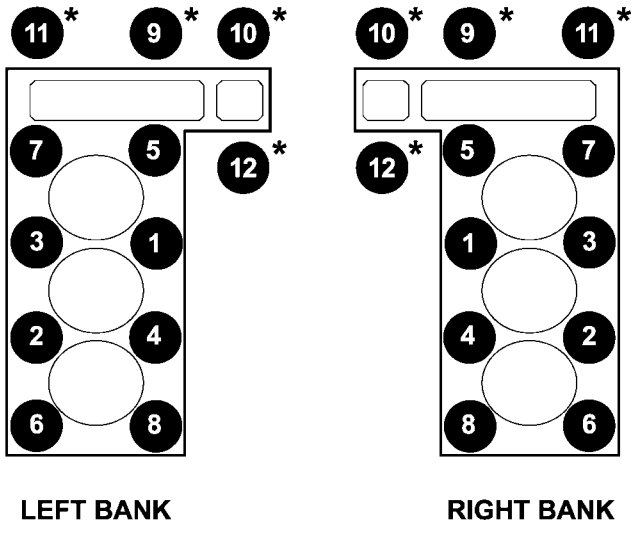

Fig. 26 Cylinder Head Tightening Sequence

* - INDICATES SEALANT ON THREADS

CYLINDER HEAD - RIGHT (Continued)

CAUTION: The nut on the right side camshaft sprocket should not be removed for any reason, as the sprocket and camshaft sensor target wheel is serviced as an assembly. If the nut was removed, torque nut to 5 NM (60 in. lbs.).

(7) Position the secondary chain onto the camshaft drive gear, making sure one marked chain link is on either side of the V6 mark on the gear then using Special Tool 8428 Camshaft Wrench, position the gear onto the camshaft.

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torquing of bolt resulting in bolt failure.

(8) Install the camshaft drive gear retaining bolt.
(9) Install the right side secondary chain guide(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/ CHAIN AND SPROCKETS - INSTALLATION).
(10) Install the cylinder head access plug.
(11) Re-set and install the right side secondary chain tensioner(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
(12) Remove Special Tool 8429.
(13) Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(14) Install the crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION). Tighten damper bolt 175 N·m (130 Ft. Lbs.).
(15) Install accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(16) Install the fan shroud(Refer to 7 - COOLING/ ENGINE/RADIATOR FAN - INSTALLATION).
(17) Install the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
(18) Install the intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
(19) Install oil fill housing onto cylinder head.
(20) Refill the cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(21) Raise the vehicle.
(22) Install the exhaust pipe onto the right exhaust manifold.
(23) Lower the vehicle.
(24) Reconnect battery negative cable.
(25) Start the engine and check for leaks.

CAMSHAFT(S)

DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

REMOVAL

CAUTION: When the timing chain is removed and the cylinder heads are still installed, DO NOT forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use special tool 8379 will result in hydraulic tensioner ratchet over extension, Requiring timing chain cover removal to re-set the tensioner ratchet.

(1) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(2) Set engine to TDC cylinder No. 1, camshaft sprocket V6 marks at the 12 o'clock position.
(3) Mark one link on the secondary timing chain on both sides of the V6 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel for any reason, Severe damage will occur to the target wheel. A damaged target wheel could cause a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave bolt snug against sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

CAMSHAFT(S) (Continued)

(5) Position Special Tool 8379 timing chain wedge between the timing chain strands. Tap the tool to securely wedge the timing chain against the tensioner arm and guide.

(6) Remove the camshaft position sensor.

(7) Hold the camshaft with Special Tool 8428 Camshaft Wrench, while removing the camshaft sprocket bolt and sprocket.

(8) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

(9) Remove the camshaft bearing caps and the camshaft.

INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

NOTE: Position the right side camshaft so that the camshaft sprocket dowel is near the 10 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

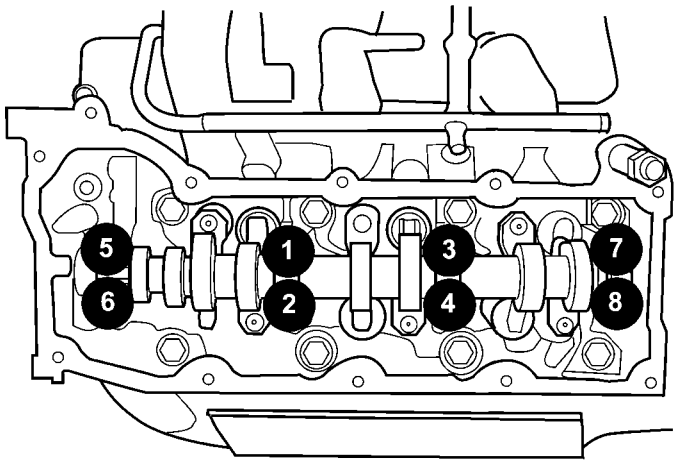
(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

NOTE: Caps should be installed so that the stamped numbers on the caps are in numerical order, (1 thru 4) from the front to the rear of the engine. All caps should be installed so that the stamped arrows on the caps point toward the front of the engine.

(4) Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 27).

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).



808a1e9b

Fig. 27 CAMSHAFT BEARING CAPS TIGHTENING

(6) Position the camshaft drive gear into the timing chain aligning the V6 mark between the two marked chain links (Two links marked during removal).

(7) Using Special Tool 8428 Camshaft Wrench, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket . Install the sprocket onto the camshaft.

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt overtorque resulting in bolt failure.

(8) Remove excess oil from camshaft sprocket bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove timing chain wedge special tool 8379.

(10) Using Special Tool 6958 spanner wrench with adapter pins 8346, torque the camshaft sprocket retaining bolt to 122 N·m (90 ft. lbs.).

(11) Install the camshaft position sensor.

(12) Install the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

CYLINDER HEAD COVER(S)

REMOVAL

(1) Disconnect battery negative cable.
(2) Remove air cleaner assembly, resonator assembly and air inlet hose.
(3) Drain cooling system, below the level of the heater hoses(Refer to 7 - COOLING - STANDARD PROCEDURE).
(4) Remove accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Remove air conditioning compressor retaining bolts and move compressor to the left.
(6) Remove heater hoses.
(7) Disconnect injector and ignition coil connectors.
(8) Disconnect and remove positive crankcase ventilation (PCV) hose.
(9) Remove oil fill tube.
(10) Un-clip injector and ignition coil harness and move away from cylinder head cover.
(11) Remove right rear breather tube and filter assembly.
(12) Remove cylinder head cover retaining bolts.
(13) Remove cylinder head cover.

INSTALLATION

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
(2) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs).
(3) Install right rear breather tube and filter assembly.
(4) Connect injector, ignition coil electrical connectors and harness retaining clips.
(5) Install the oil fill tube.
(6) Install PCV hose.
(7) Install heater hoses.
(8) Install air conditioning compressor retaining bolts.
(9) Install accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(10) Fill Cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(11) Install air cleaner assembly, resonator assembly and air inlet hose.
(12) Connect battery negative cable.

ROCKER ARM

DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8 mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

NOTE: Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(2) For rocker arm removal on cylinder No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
(3) For rocker arm removal on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.
(4) For rocker arm removal on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
(5) For rocker arm removal on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
(6) Using special tool 8516 Rocker Arm Remover, press downward on the valve spring, remove rocker arm (Fig. 28).

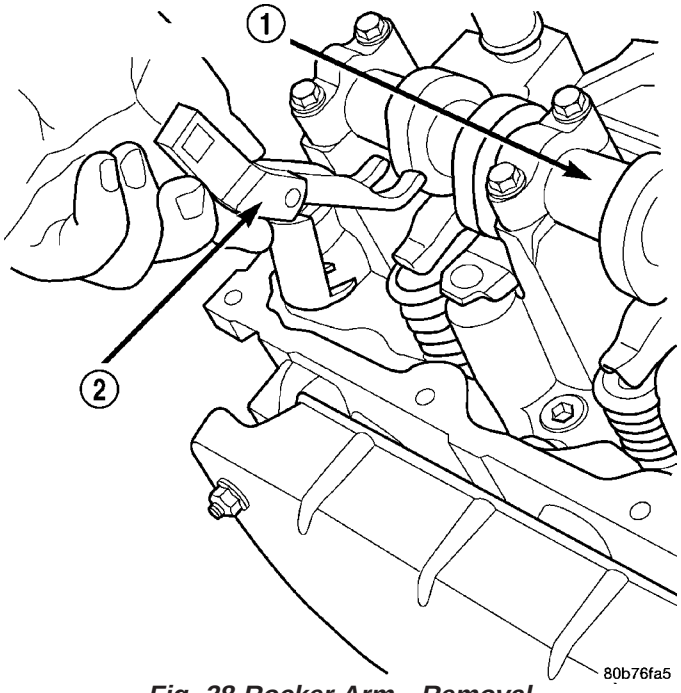


Fig. 28 Rocker Arm - Removal

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

VALVE GUIDE SEALS

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

VALVE SPRINGS

DESCRIPTION

The valve springs are made from high strength chrome silicon steel. There are different springs for intake and exhaust applications. The exhaust spring has an external damper. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

REMOVAL

(1) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(2) Using Special Tool 8516 Valve Spring Compressor, remove the rocker arms and the hydraulic lash adjusters.
(3) Remove the spark plug for the cylinder the valve spring and seal are to be removed from.
(4) Apply shop air to the cylinder to hold the valves in place when the spring is removed.

NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

(5) Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(6) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(7) Remove the valve spring compressor.

NOTE: The valve springs are NOT common between intake and exhaust.

(8) Remove the spring retainer, and the spring.
(9) Remove the valve stem seal.

NOTE: The valve stem seals are common between intake and exhaust.

INSTALLATION

NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

(1) Apply shop air to the cylinder to hold the valves in place while the spring is installed.

NOTE: The valve stem seals are common between intake and exhaust.

(2) Install the valve stem seal.

NOTE: The valve springs are NOT common between intake and exhaust.

(3) Install the spring retainer, and the spring.
(4) Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.
(5) Install the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(6) Remove the valve spring compressor.
(7) Disconnect the shop air to the cylinder.
(8) Install the spark plug for the cylinder the valve spring and seal was installed on.
(9) Using Special Tool 8516 Valve Spring Compressor, install the rocker arms and the hydraulic lash adjusters.
(10) Install the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ENGINE BLOCK

DESCRIPTION

The cylinder block is made of cast iron. The block is a closed deck design with the left bank forward. To provide high rigidity and improved NVH an enhanced compacted graphite bedplate is bolted to the block. The block design allows coolant flow between the cylinders bores, and an internal coolant bypass to a single poppet inlet thermostat is included in the cast aluminum front cover.

STANDARD PROCEDURE - CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.
(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool

ENGINE BLOCK (Continued)

for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 29).

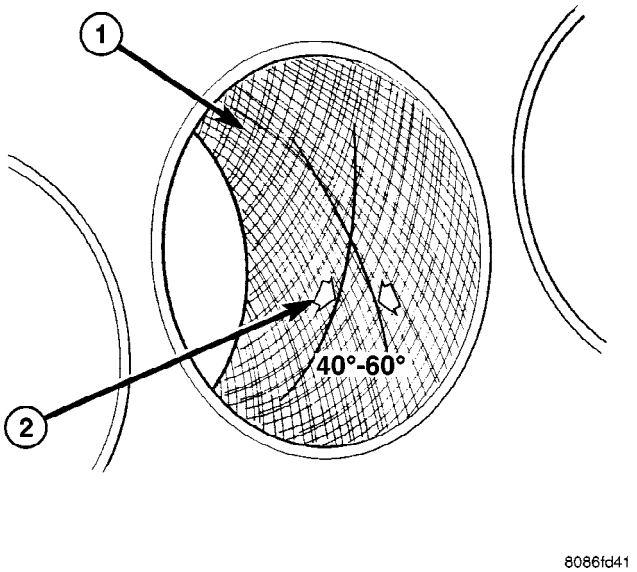

Fig. 29 CYLINDER BORE CROSSHATCH PATTERN

1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the 1/4 inch NPT plugs to 20 N·m (177 in. lbs.) torque. Tighten the 3/8 inch NPT plugs to 27 N·m (240 in. lbs.) torque.

INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer (Fig. 30).

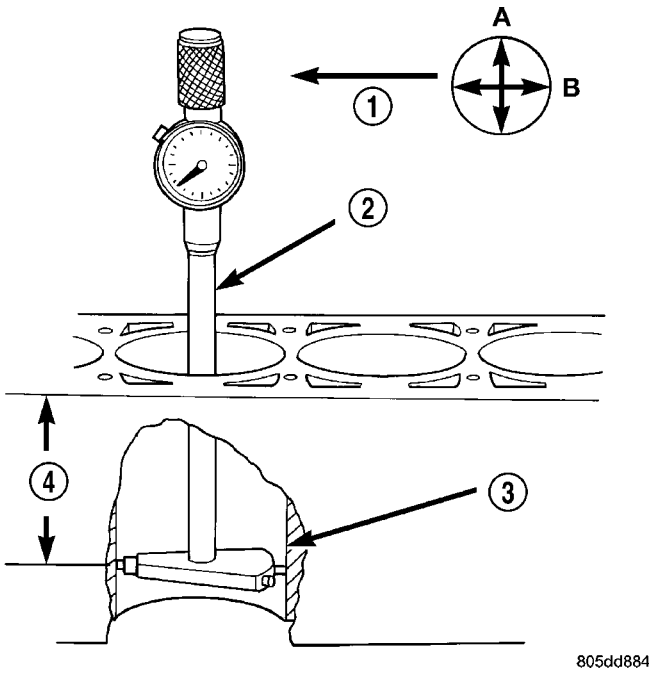

Fig. 30 BORE GAUGE-TYPICAL

1 - FRONT
2 - BORE GAUGE
3 - CYLINDER BORE
4 - 38 MM (1.5 in)

ENGINE BLOCK (Continued)

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

CRANKSHAFT

DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a three throw split pin design with six counterweights for balancing purposes. The crankshaft is supported by four select fit main bearings with the No. 2 serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The No. 6 counterweight has provisions for crankshaft position sensor target wheel mounting. The select fit main bearing markings are located on the rear side of the target wheel (Fig. 31). The crankshaft oil seals are one piece design. The front oil seal is retained in the timing chain cover, and the rear seal is pressed in to a bore formed by the cylinder block and the bedplate assembly.

REMOVAL

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

(1) Remove the engine(Refer to 9 - ENGINE - REMOVAL).

(2) Remove the engine oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

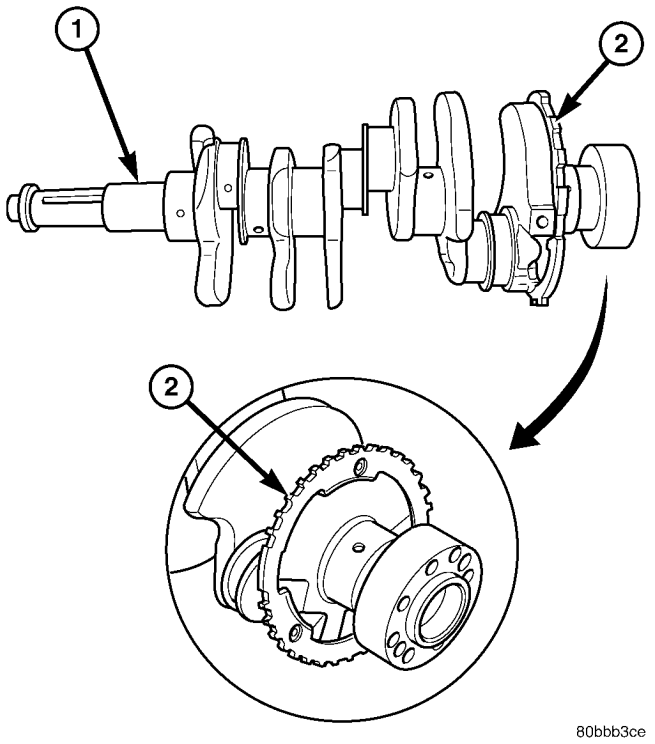

Fig. 31 CRANKSHAFT AND TARGET RING

1 - CRANKSHAFT
2 - CRANKSHAFT POSITION SENSOR TARGET RING

CAUTION: DO NOT pry on the oil pan gasket when removing the oil pan, The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when removing oil pan. Gasket can not be removed with oil pan.

(3) Remove the bedplate mounting bolts. Note the location of the two stud bolts for installation.

(4) Remove the connecting rods from the crankshaft.

CAUTION: The bedplate to cylinder block mating surface is a critical sealing surface. Do not pry on or damage this surface in anyway.

NOTE: The bedplate contains the lower main bearing halves. Use care when handling bedplate as not to drop or damage bearing halves. Installing main bearing halves in the wrong position will cause severe damage to the crankshaft.

CRANKSHAFT (Continued)

NOTE: The bedplate has pry points cast into it. Use these points only. The pry points are shown below.

(5) Carefully pry on the pry points (Fig. 32) to loosen the bedplate then remove the bedplate.

CAUTION: When removing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

(6) Remove the crankshaft.
(7) Remove the crankshaft tone wheel.

INSPECTION

NOTE: Thoroughly inspect the connecting rod bearing bores and main bearing bores for scoring, blueing or severe scratches. Further disassembly may be required.

If connecting rod bearing bores show damage, the cylinder heads must be removed to service the piston and rod assemblies. If the bedplate or the cylinder block main bearing bores show damage the engine must be replaced.

(1) If required, remove the main bearing halves from the cylinder block and bedplate.
(2) Thoroughly clean the bedplate to cylinder block sealing surfaces and main bearing bores. Remove all oil and sealant residue.
(3) Inspect the bedplate main bearing bores for cracks, scoring or severe blueing. If either condition exists the engine must be replaced.
(4) Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing. If either condition exist replace the thrust washers.
(5) Inspect the oil pan gasket/windage tray for splits, tears or cracks in the gasket sealing surfaces. Replace gasket as necessary.

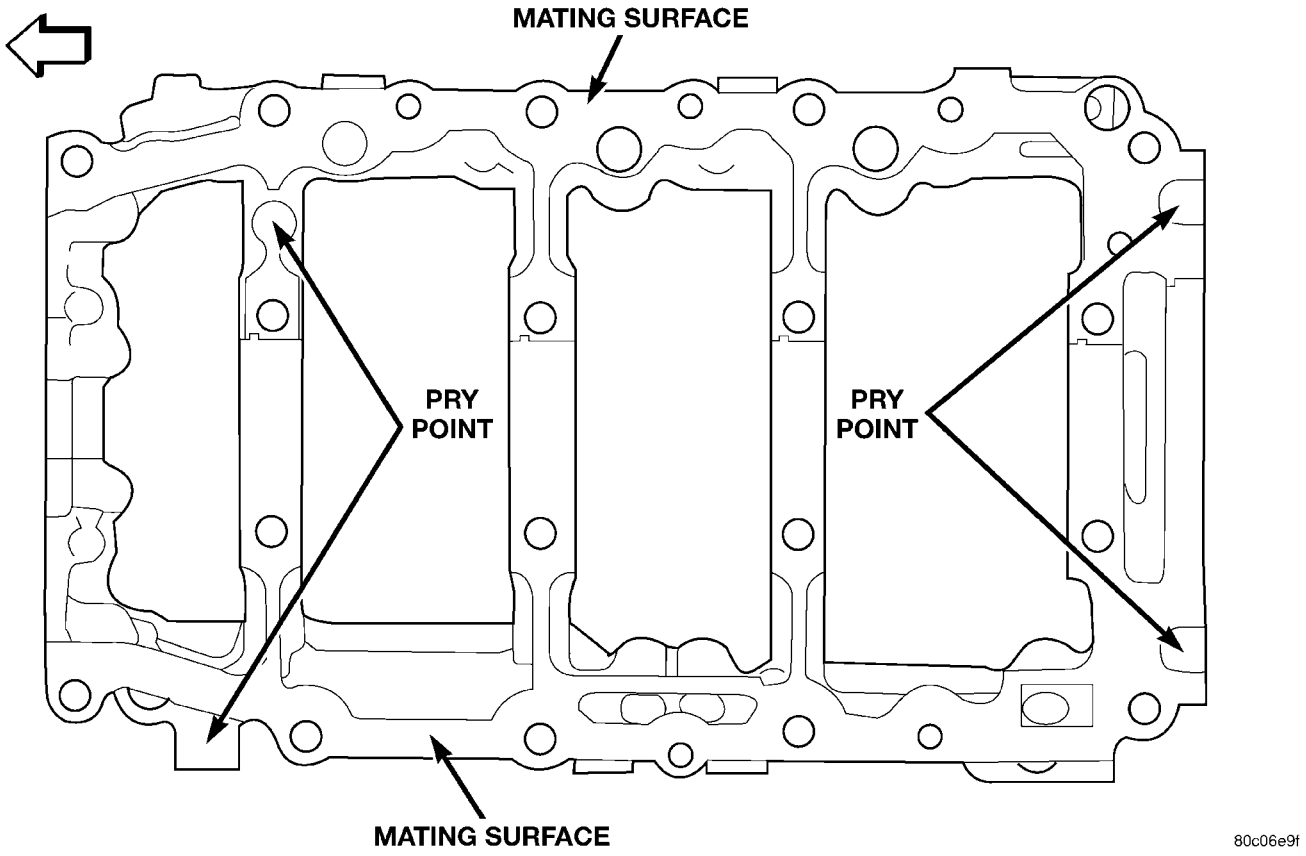

Fig. 32 BEDPLATE PRY POINT LOCATION

CRANKSHAFT (Continued)

INSTALLATION

CAUTION: Main bearings are select fit. Refer to Crankshaft Main Bearings in this section for proper bearing selections.

CAUTION: When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

NOTE: Apply sealant to the tone wheel retaining screws prior to installation.

(1) Lubricate upper main bearing halves with clean engine oil.

(2) Install the crankshaft tone wheel. Torque the mounting screws to 15 N·m (11 ft. lbs.).

(3) Position crankshaft in cylinder block.

(4) Install the thrust washers (Fig. 33).

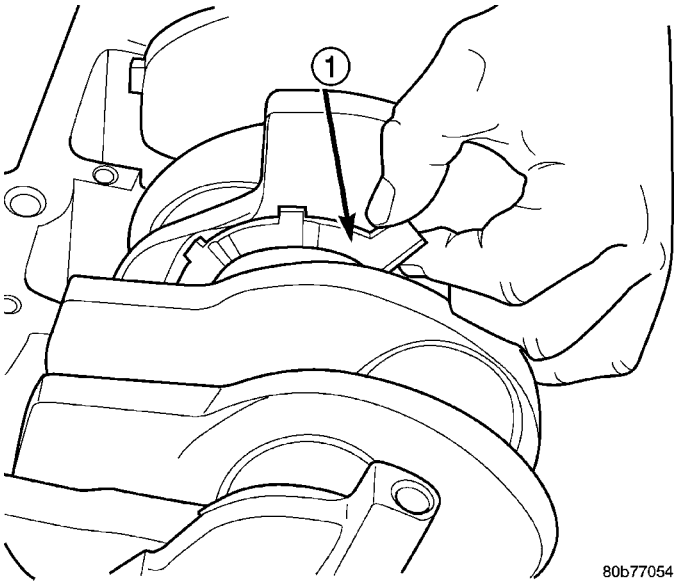

Fig. 33 Crankshaft Thrust Washer Installation

1 - CRANKSHAFT THRUST WASHER

CAUTION: The bedplate to cylinder block mating surface must be coated with Mopar® Engine RTV sealant prior to installation. Failure to do so will cause severe oil leaks.

NOTE: Make sure that the bedplate and cylinder block sealing surfaces are clean and free of oil or other contaminants. Contaminants on the sealing surfaces may cause main bearing distortion and/or oil leaks.

(5) Apply a 2.5mm (0.100 inch) bead of Mopar® Engine RTV sealant to the cylinder block-to-bedplate mating surface as shown (Fig. 34).

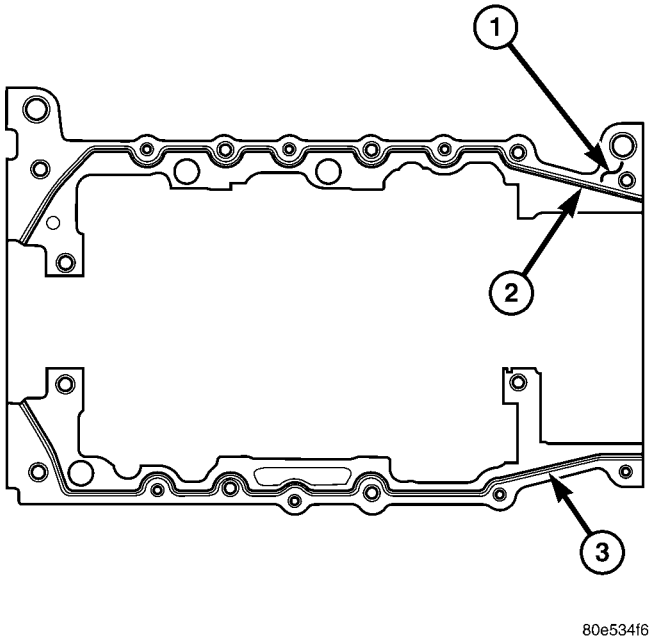

Fig. 34 BEDPLATE SEALANT

1 - CYLINDER BLOCK
2 - SEALENT
3 - SEALANT

(6) Coat the crankshaft main bearing journals with clean engine oil and position the bedplate onto the cylinder block.

CRANKSHAFT (Continued)

NOTE: Lubricate the bedplate retaining bolts with clean engine oil prior to installation.

(7) Install the bedplate retaining bolts, making sure to place the stud bolts in the correct location, Torque the bolts in the sequence shown (Fig. 35).

- Hand tighten bolts **1D,1G and 1F** until the bedplate contacts the block.
- Tighten bolts **1A - 1J** to 54 N·m (40 ft. lbs.)
- Tighten bolts **1 - 8** to 7 N·m (5 ft. lbs.)
- Turn bolts **1 - 8** an additional 90°.
- Tighten bolts **A - E** 27 N·m (20 ft. lbs.).

(8) Measure crankshaft end play.

(9) Install the connecting rods and measure side clearance(Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

(10) Install oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(11) Install the engine(Refer to 9 - ENGINE - INSTALLATION).

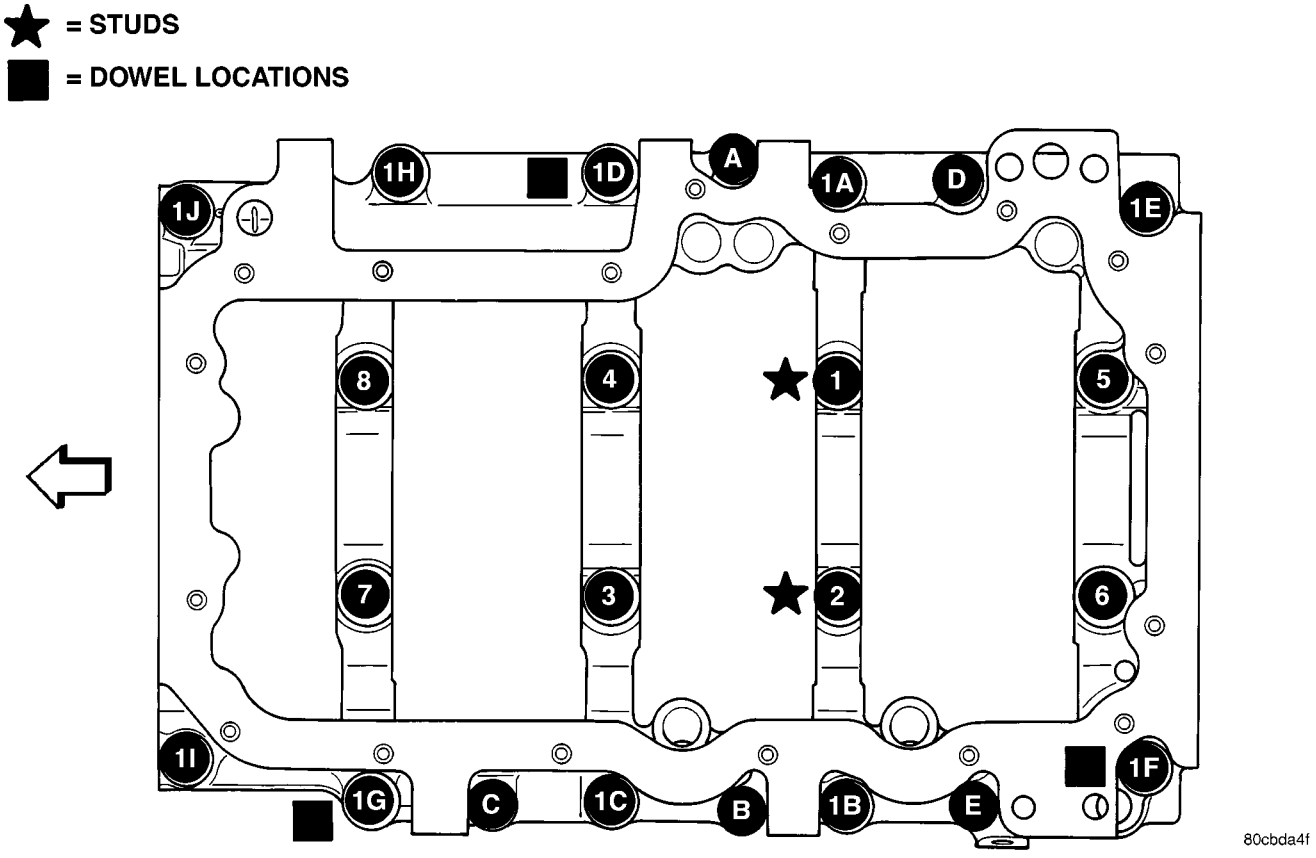

Fig. 35 BEDPLATE TIGHTENING SEQUENCE

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE

MAIN BEARING FITTING

SELECT FIT IDENTIFICATION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crankshaft position sensor target wheel has grade identification marks stamped into it (Fig. 36). These marks are read from left to right, corresponding with journal number 1, 2, 3, 4. The crankshaft position sensor target wheel is mounted to the number 6 counter weight on the crankshaft.

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Remove the crankshaft from the cylinder block(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL).

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

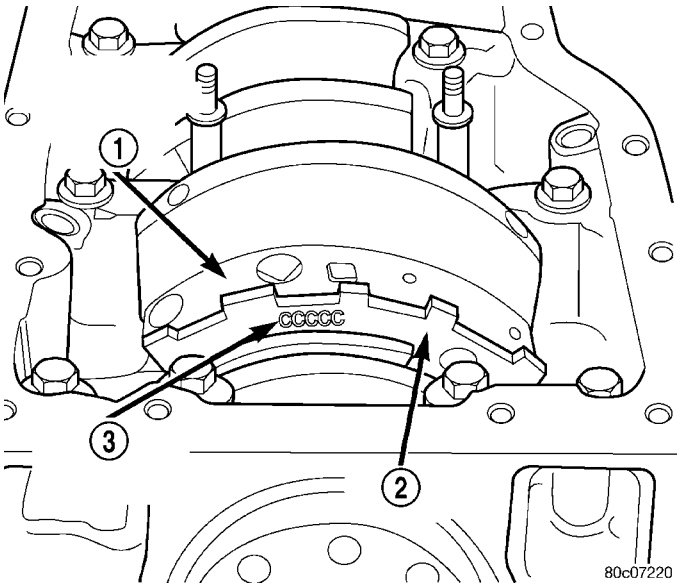

Fig. 36 MARKINGS ON TARGET WHEEL

1 - REARMOST CRANKSHAFT COUNTER WEIGHT
2 - TARGET WHEEL
3 - MAIN BEARING SELECT FIT MARKINGS

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

Install the crankshaft into the cylinder block(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSPECTION).

Check crankshaft end play.

CRANKSHAFT MAIN BEARINGS (Continued)

CRANKSHAFT MAIN BEARING SELECTION

(1) Service main bearings are available in four grades. The chart below identifies the four service grades available.

Crankshaft Marking	JOURNAL SIZE SIZE mm (in.)	
″R″ Size	63.488 - 63.496 mm (2.4995 - 2.4998 in.)	
″S″ Size	63.496 - 63.500 mm (2.4998 - 2.4999 in.)	
″T″ Size	63.500 - 63.504 mm (2.4999 - 2.501 in.)	
″U″ Size	63.504 - 63.512 mm (2.5001 - 2.5004 in.)	
Bearing size		
Bearing Code	Size	Application
Upper Bearing		
A	.2.443 - 2.447 mm (.0961 - .0963 in.)	Use with crankshaft size ″R″
B	2.439 - 2.443 mm (0.960 - .0961 in.)	Use with crankshaft ″S, T″
C	2.435 - 2.439 mm (.0958 - .0960 in.)	Use with crankshaft ″U″
Lower Bearing Main ″1″ and ″4″		
″1″	2.441 - 2.447 mm (.0961 -.0963 in.)	Use with crankshaft ″R, S″
″2″	2.435 - 2.441 mm (.0958 - .0962 in.)	Use with crankshaft ″T, U″

Crankshaft Marking	JOURNAL SIZE SIZE mm (in.)	
Lower Main Bearing ″2″ and ″3″		
″3″	2.429 - 2.435 mm (.0956 - .0958 in.)	Use with crankshaft ″R, S″
″4″	2.423 - 2.429 mm (.0953 - .0956 in.)	Use with crankshaft ″T, U″
Bearing Clearances		
Main ″1, 4″		
Crankshaft ″R″	.004 - .034 mm (.00015 - .0013 in.)	
Crankshaft ″S″	.004 - .030 mm (.00015 - .0011 in.)	
Crankshaft ″T″	.006 - .032 mm (.0002 - .0012 in.)	
Crankshaft ″U″	.002 - .032 mm (.00007 -. 0012 in.)	
Main ″2, 3″		
Crankshaft ″R″	.016 - .046 mm (.0006 - .0018 in.)	
Crankshaft ″S″	.016 - .042 mm (.00062 - .016 in.)	
Crankshaft ″T″	.018 - .044 mm (.0007 - .0017 in.)	
Crankshaft ″U″	.014 - .044 mm (.0005 - .0017 in.)	

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect negative cable from battery.
(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(3) Remove A/C compressor mouning fasteners and set aside.
(4) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(5) Remove upper radiator hose.
(6) Disconnect electrical connector for fan mounted inside radiator shroud.
(7) Remove radiator shroud attaching fasteners.

NOTE: Transmission cooler line snaps into shroud lower right hand corner.

(8) Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(9) Remove crankshaft damper bolt.
(10) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 37).
(11) Using Special Tool 8511, remove crankshaft front seal (Fig. 38).

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(1) Using Special Tool 8348 and 8512, install crankshaft front seal (Fig. 39).
(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

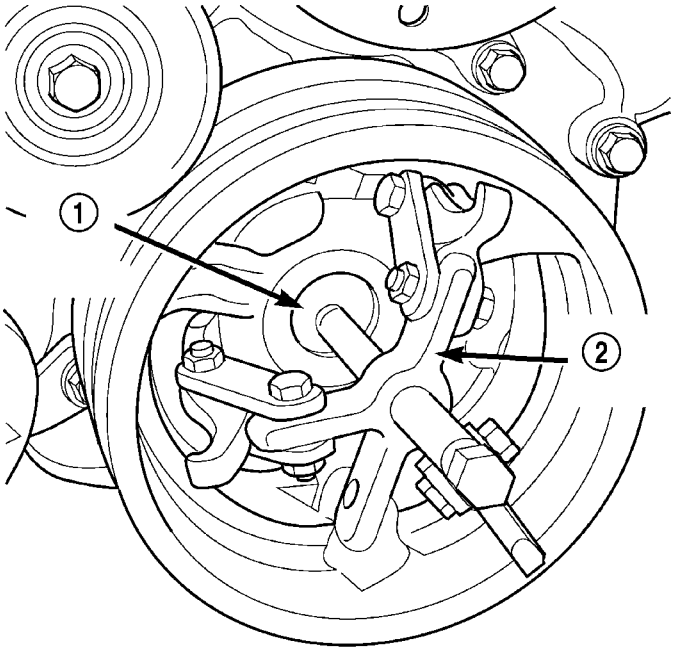

Fig. 37 Crankshaft Damper Removal

1 - SPECIAL TOOL 8513 INSERT
2 - SPECIAL TOOL 1026

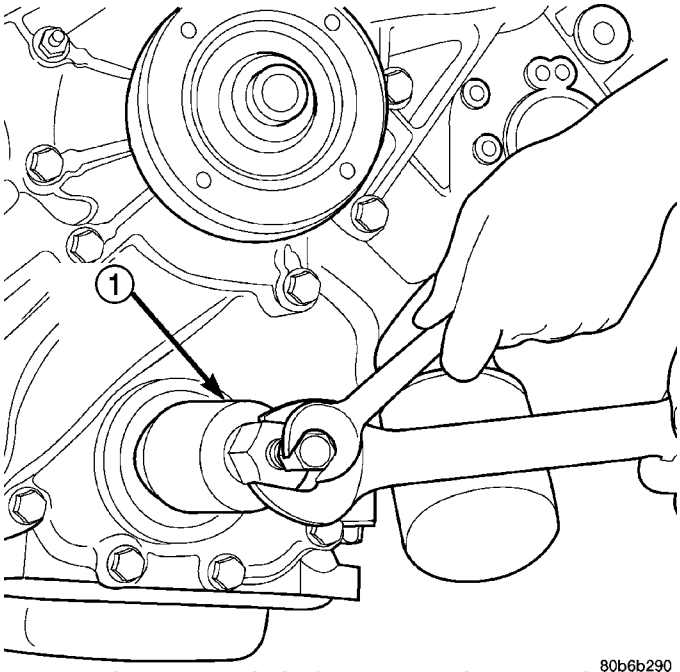

Fig. 38 Crankshaft Front Seal Removal

1 - SPECIAL TOOL 8511

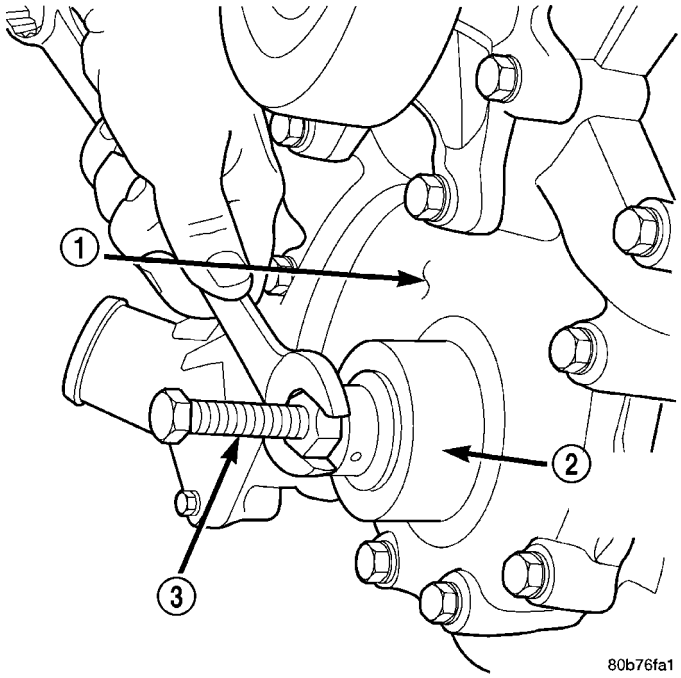

Fig. 39 Crankshaft Front Seal Installation

1 - TIMING CHAIN COVER
2 - SPECIAL TOOL 8348
3 - SPECIAL TOOL 8512

(3) Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(4) Install upper radiator hose.
(5) Install A/C compressor and tighten fasteners to 54 N·m (40 ft. lbs.).
(6) Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(7) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(8) Connect negative cable to battery.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

NOTE: This procedure can be performed in vehicle.

(1) If being preformed in vehicle, remove the transmission.
(2) Remove the flexplate (Refer to 9 - ENGINE/ ENGINE BLOCK/FLEX PLATE - REMOVAL).

NOTE: The crankshaft oil seal CAN NOT be reused after removal.

NOTE: The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.

(3) Using Special Tool 8506 (Fig. 40), remove the crankshaft rear oil seal.

INSTALLATION

(1) Lubricate the crankshaft flange with engine oil.
(2) Position the magnetic seal guide Special Tool 8349-2 (Fig. 41) onto the crankshaft rear face. Then position the crankshaft rear oil seal onto the guide.

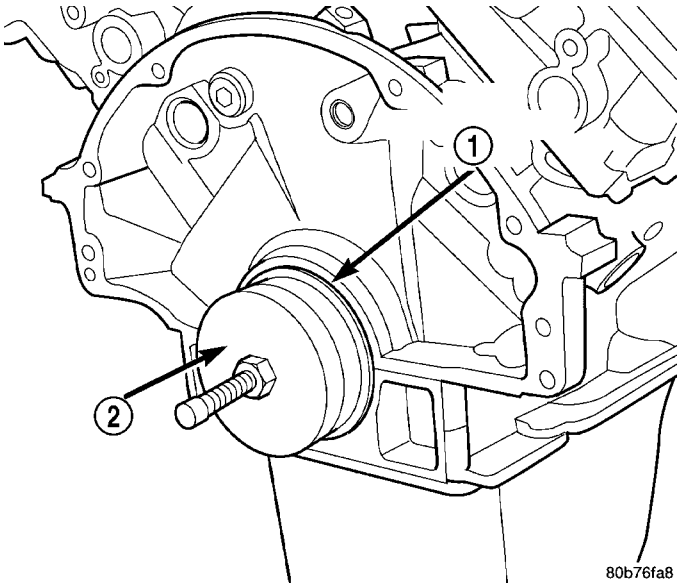

Fig. 40 Crankshaft Rear Oil Seal Removal

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8506

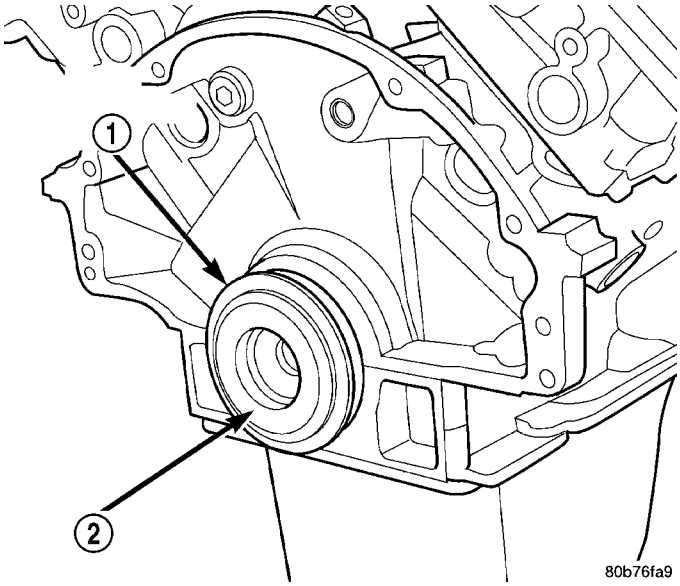

Fig. 41 Crankshaft Rear Oil Seal Guide Special Tool 8349-2 and Oil

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-2 GUIDE

CRANKSHAFT OIL SEAL - REAR (Continued)

(3) Using Special Tools 8349 Crankshaft Rear Oil Seal Installer and C-4171 Driver Handle (Fig. 42), with a hammer, tap the seal into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.

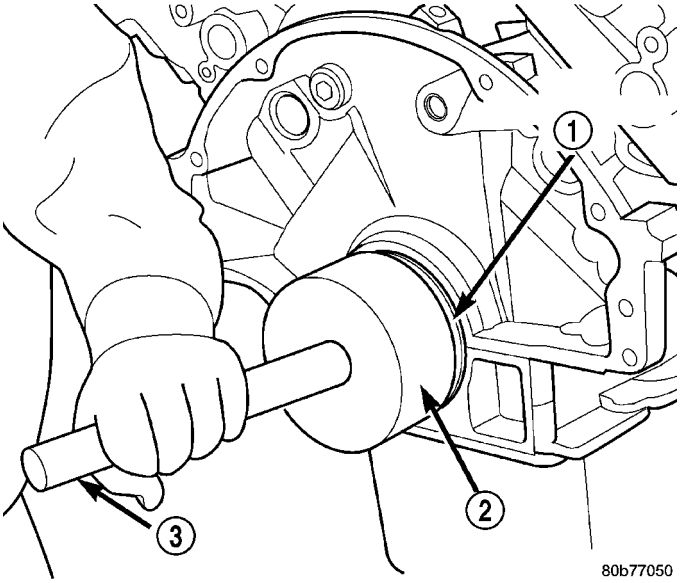

Fig. 42 Crankshaft Rear Oil Seal Installation

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-1 INSTALLER
3 - SPECIAL TOOL C-4171 HANDLE

(4) Install the flexplate.
(5) Install the transmission.

FLEX PLATE

REMOVAL

(1) Remove the transmission.
(2) Remove the bolts and flexplate.

INSTALLATION

(1) Position the flexplate onto the crankshaft and install the bolts hand tight.
(2) Tighten the flexplate retaining bolts to 95 N·m (70 ft. lbs.) in the sequence shown (Fig. 43).
(3) Install the transmission.

PISTON & CONNECTING ROD

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

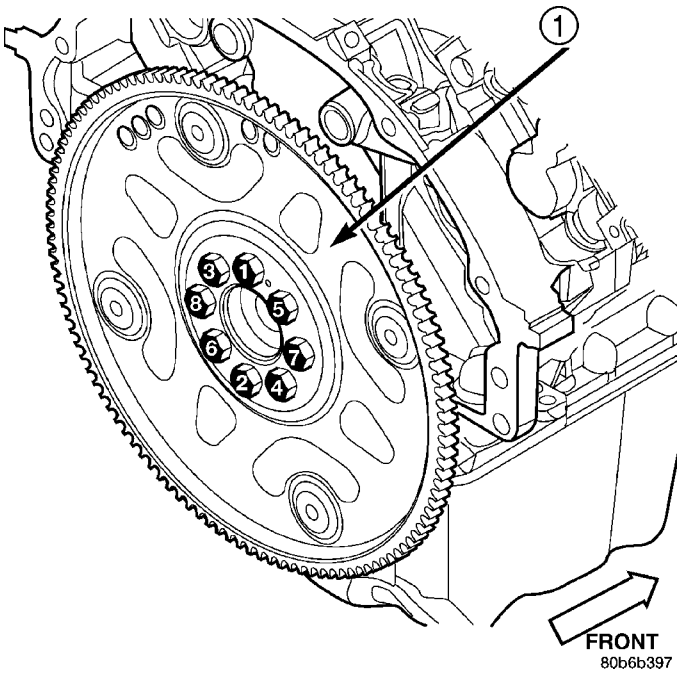

Fig. 43 Flexplate Tightening Sequence

1 - FLEXPLATE

The pistons are made of a high strength aluminum alloy. The connecting rods are made of forged powdered metal, with a “fractured cap” design. A full floating piston pin is used to attach the piston to the connecting rod (Fig. 44).

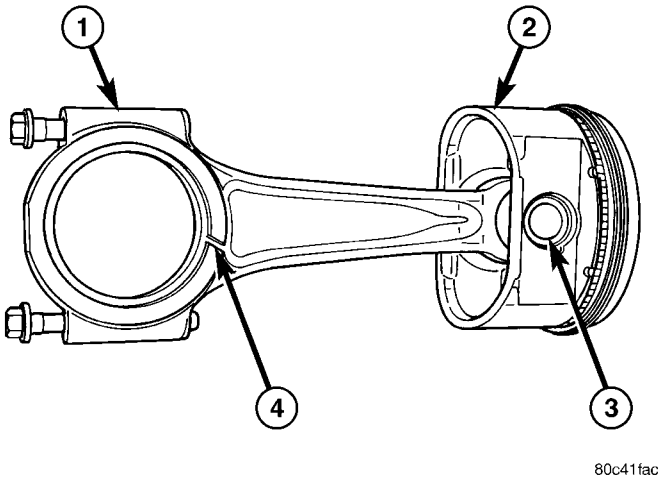

Fig. 44 PISTON AND ROD ASSEMBLY

1 - CONNECTING ROD
2 - PISTON
3 - PISTON PIN
4 - OIL SLINGER SLOT

PISTON & CONNECTING ROD (Continued)

STANDARD PROCEDURE

CONNECTING ROD BEARING FITTING

Inspect the connecting rod bearings for scoring. Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 45). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs (Fig. 46).

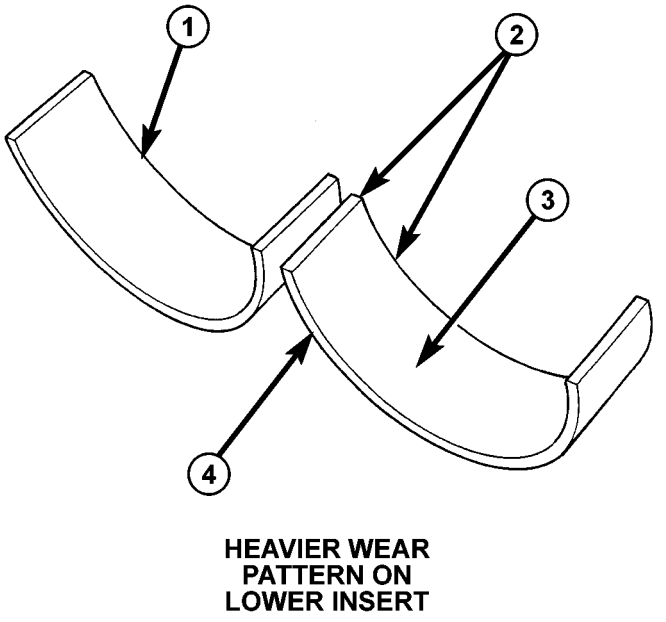

Fig. 45 Connecting Rod Bearing Inspection

1 - UPPER BEARING HALF
2 - MATING EDGES
3 - GROOVES CAUSED BY ROD BOLTS SCRATCHING JOURNAL DURING INSTALLATION
4 - WEAR PATTERN - ALWAYS GREATER ON UPPER BEARING

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

(1) Wipe the oil from the connecting rod journal.

(2) Lubricate the upper bearing insert and position in connecting rod. Center bearing insert in connecting rod (Fig. 47)

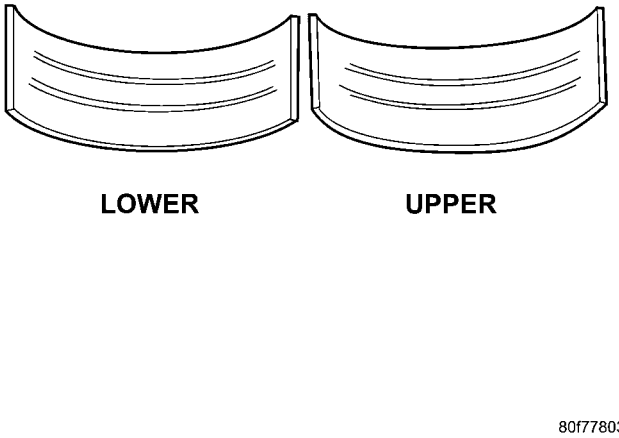

Fig. 46 Scoring Caused by Insufficient Lubrication or Damaged Crankshaft Journal

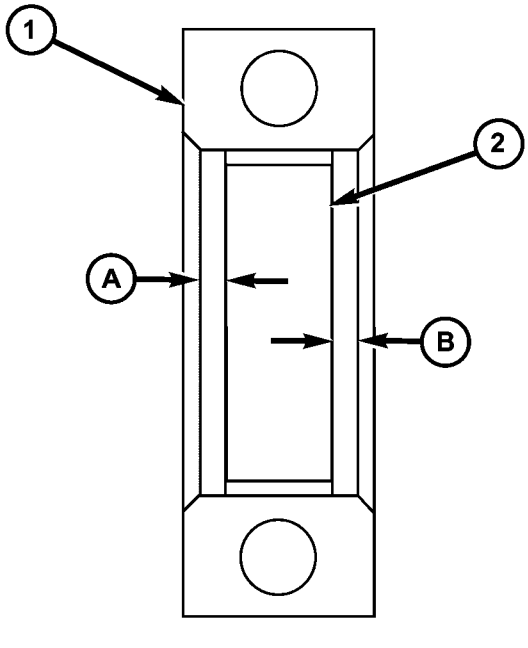

Fig. 47 Bearing Insert Location

1 - Connecting Rod
2 - Bearing Insert
- A, B less then .50 mm (.0196 in.)

PISTON & CONNECTING ROD (Continued)

(3) Use piston ring compressor and Guide Pins Special Tool 8507 (Fig. 48) to install the rod and piston assemblies. The oil slinger slots in the rods must face front of the engine. The "F"'s near the piston wrist pin bore should point to the front of the engine.

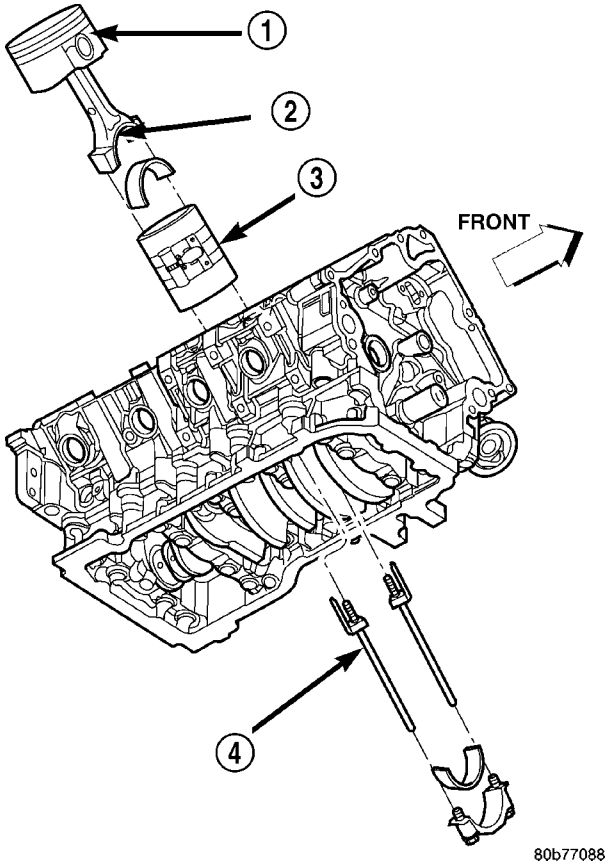

Fig. 48 Piston and Connecting Rod -Installation - Typical

1 - "F" TOWARD FRONT OF ENGINE
2 - OIL SLINGER SLOT
3 - RING COMPRESSOR
4 - SPECIAL TOOL 8507

(4) Install the lower bearing insert in the bearing cap. Center bearing insert in connecting rod (Fig. 47). The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

(5) Install bearing cap and connecting rod on the journal and tighten bolts to 27 N·m (20 ft. lbs.) plus a 90° turn. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

(6) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 49). Refer to Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

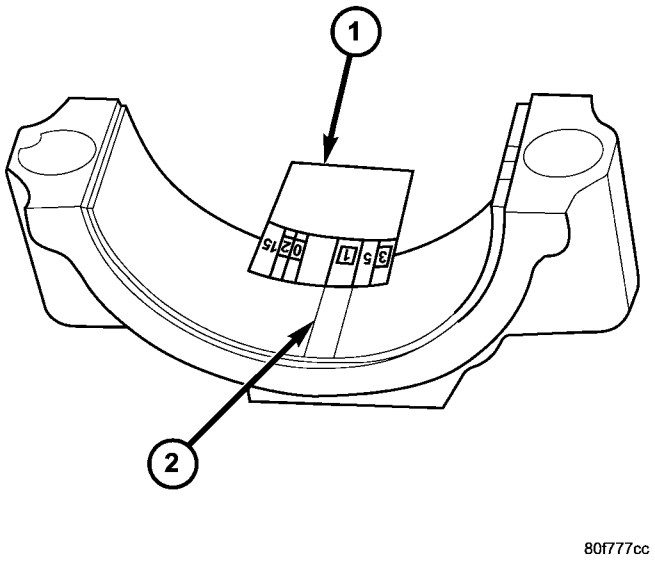

Fig. 49 Measuring Bearing Clearance with Plastigage

1 - PLASTIGAGE SCALE
2 - COMPRESSED PLASTIGAGE

(7) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

(8) If bearing-to-journal clearance exceeds the specification, determin which services bearing set to use the bearing sizes are as follows:

Bearing Mark	SIZE	USED WITH JOURNAL SIZE
.025 US	.025 mm (.001 in.)	57.883-57.867 mm (2.2788-2.2783 in.)
Std.	STANDARD	57.908-57.892 mm (2.2798-2.2792 in.)
.250 US	.250 mm (.010 in.)	57.658-57.646 mm (2.2700-2.2695 in.)

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

(9) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

PISTON & CONNECTING ROD (Continued)

(10) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 27 N·m (20 ft. lbs.) plus a 90° turn.

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 50). Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

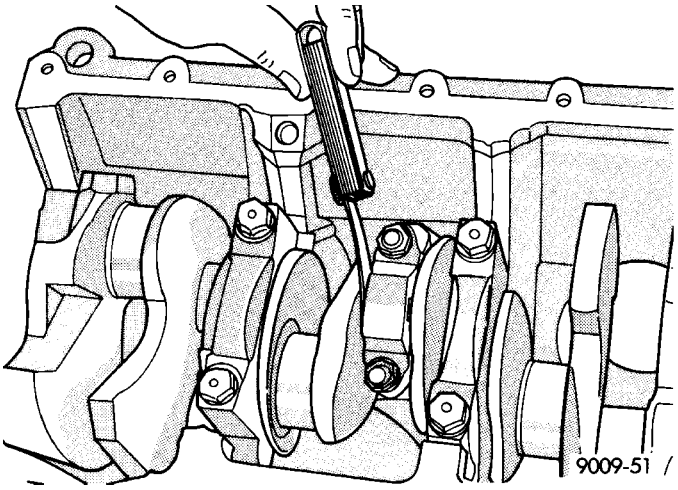

Fig. 50 Checking Connecting Rod Side Clearance - Typical

STANDARD PROCEDURE - PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 52).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 51). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

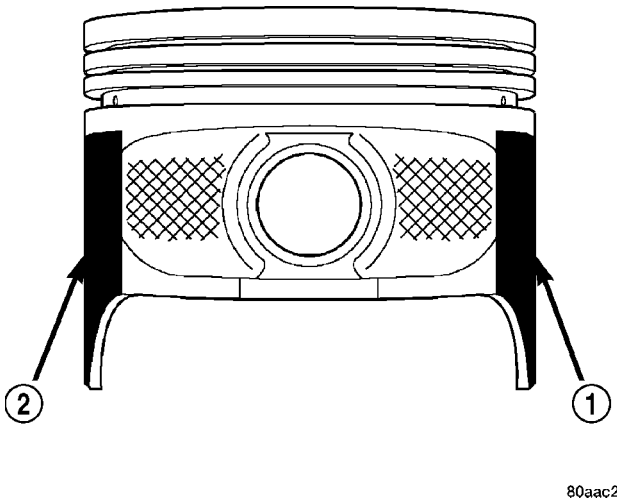

Fig. 51 DO NOT MEASURE MOLY COATED PISTON

1 - MOLY COATED
2 - MOLY COATED

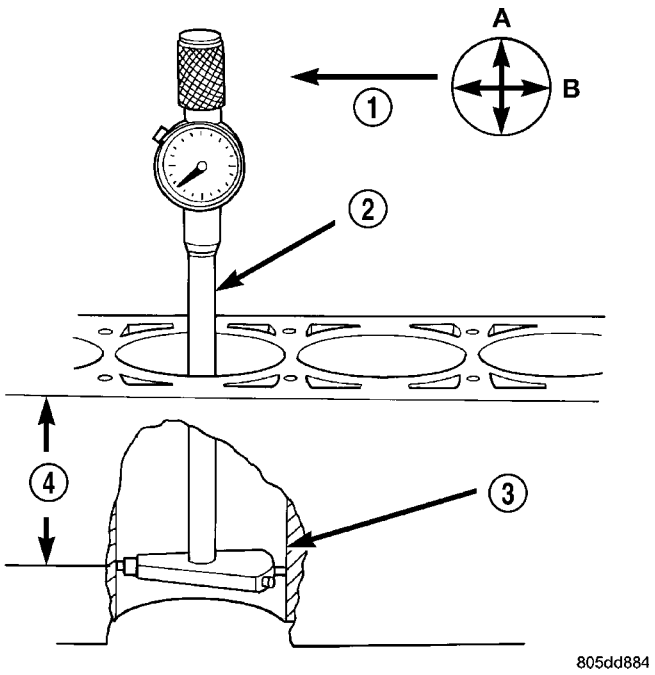

Fig. 52 BORE GAUGE - TYPICAL

1 - FRONT
2 - BORE GAUGE
3 - CYLINDER BORE
4 - 38 MM (1.5 in)

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the following components:

- Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

PISTON & CONNECTING ROD (Continued)

• Timing chain cover (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
• Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

(3) If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

(4) Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

(5) Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur

(6) Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

(1) Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
(2) Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Before installing piston and connecting rod assemblies into the bore, install the piston rings.
(2) Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**
(3) Position bearing onto connecting rod. Ensure that hole in bearing shell aligns with hole in connecting rod. Lubricate bearing surface with clean engine oil.
(4) Install Special Tool 8507 Connecting Rod Guides into connecting rod bolt threads (Fig. 53).
(5) The pistons are marked on the piston pin bore surface with an raised “F” indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks. The connecting rod oil slinger slot faces the front of the engine (Fig. 54).
(6) Wipe cylinder bore clean and lubricate with engine oil.
(7) Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.
(8) Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

(9) Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) plus 90°.
(10) Install the following components:
• Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

PISTON & CONNECTING ROD (Continued)

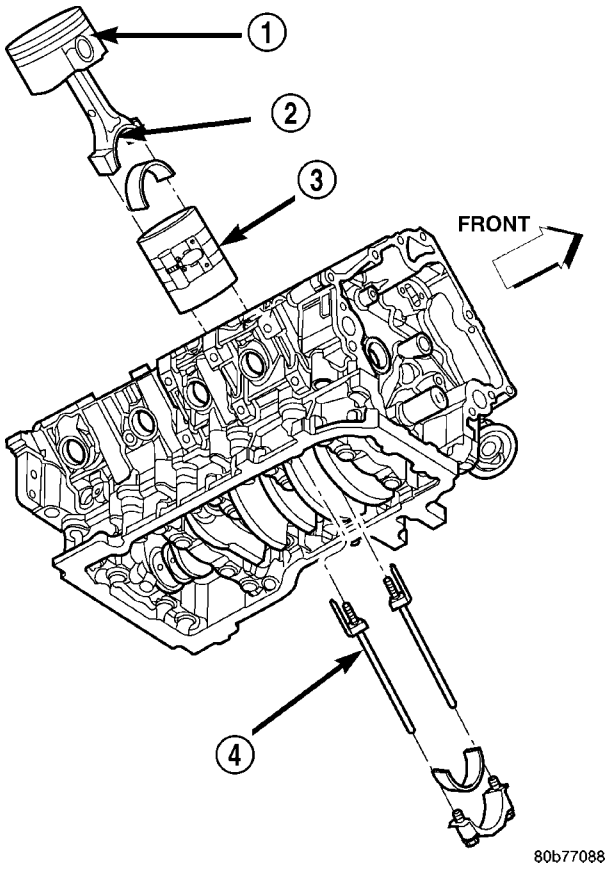

Fig. 53 PISTON AND CONNECTING ROD INSTALLATION

1 - "F" TOWARD FRONT OF ENGINE
2 - OIL SLINGER SLOT
3 - RING COMPRESSOR
4 - SPECIAL TOOL 8507

- Timing chain and cover. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- Cylinder head covers (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Fill crankcase with proper engine oil to correct level.

(12) Connect negative cable to battery.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

(1) Wipe the cylinder bore clean.

(2) Insert the ring in the cylinder bore.

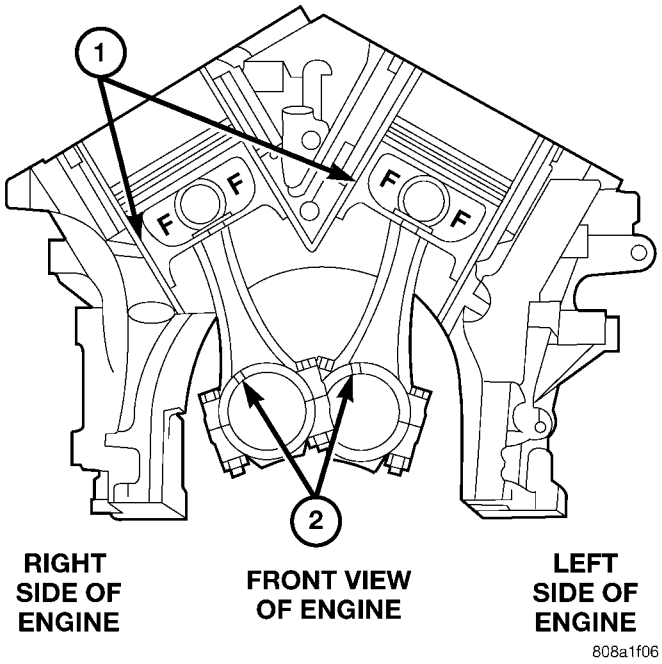

Fig. 54 PISTON AND CONNECTING ROD ORIENTATION

1 - MAJOR THRUST SIDE OF PISTON
2 - OIL SLINGER SLOT

NOTE: The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.

(3) Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.

(4) Using a feeler gauge check the ring end gap (Fig. 55). Replace any rings not within specification.

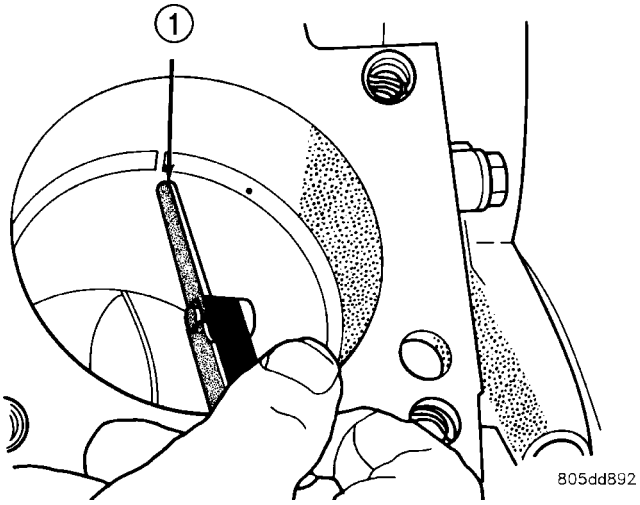

Fig. 55 Ring End Gap Measurement - Typical

1 - FEELER GAUGE

PISTON RINGS (Continued)

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

(5) Measure the ring side clearance as shown (Fig. 56) make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.

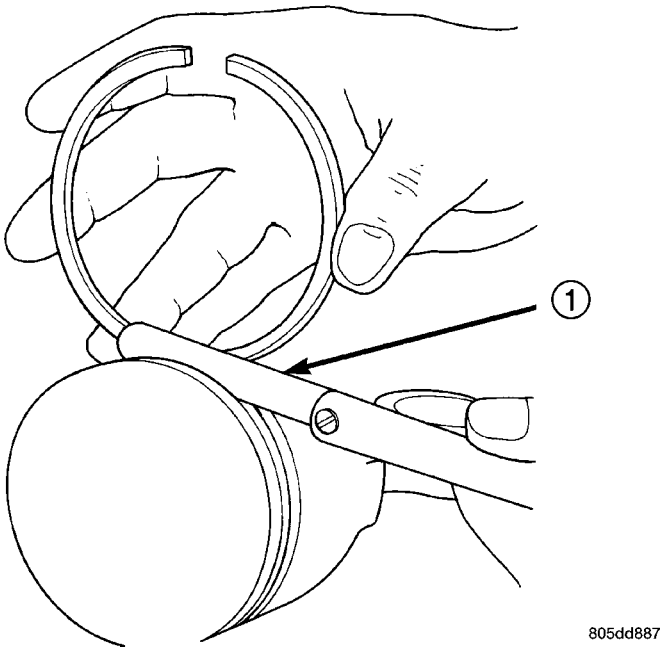

Fig. 56 Measuring Piston Ring Side Clearance

1 - FEELER GAUGE

(6) Rotate the ring around the piston, the ring must rotate in the groove with out binding.

PISTON RING SPECIFICATION CHART

Ring Position	Groove Clearance	Maximum Clearance
Upper Ring	.051-.094 mm (0.0020-.0037 in.)	0.11 mm (0.004 in.)
Intermediate Ring	0.04-0.08 mm (0.0016-0.0031 in.)	0.10 mm (0.004 in.)
Oil Control Ring (Steel Rails)	.019-.229 mm (.0007-.0090 in.)	.25 mm (0.010 in.)
Ring Position	**Ring Gap**	**Wear Limit**
Upper Ring	0.20-0.36 mm (0.0079-0.0142 in.)	0.43 mm (0.0017 in.)
Intermediate Ring	0.37-0.63 mm (0.0146-0.0249 in.)	0.74 mm (0.029 in.)
Oil Control Ring (Steel Rail)	0.025-0.76 mm (0.0099- 0.03 in.)	1.55 mm (0.061 in.)

(7) The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

- **Oil ring expander.**
- **Upper oil ring side rail.**
- **Lower oil ring side rail.**
- **No. 2 Intermediate piston ring.**
- **No. 1 Upper piston ring.**

PISTON RINGS (Continued)

(8) Install the oil ring expander.

(9) Install upper side rail (Fig. 57) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

(10) Install No. 2 intermediate piston ring using a piston ring installer (Fig. 58).

(11) Install No. 1 upper piston ring using a piston ring installer (Fig. 58).

(12) Position piston ring end gaps as shown in (Fig. 59). It is important that expander ring gap is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.

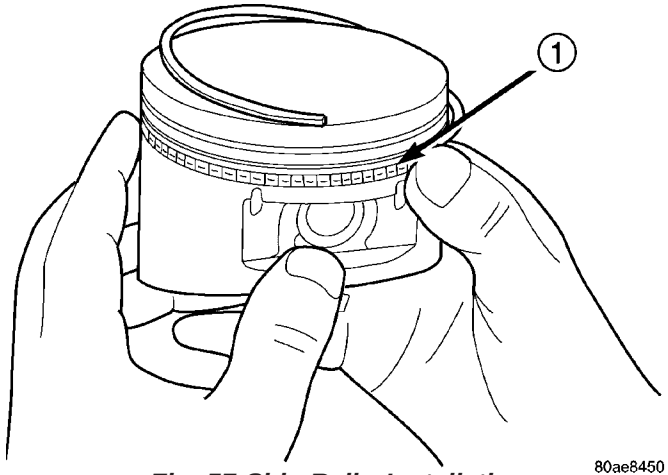

Fig. 57 Side Rail - Installation

1 - SIDE RAIL END

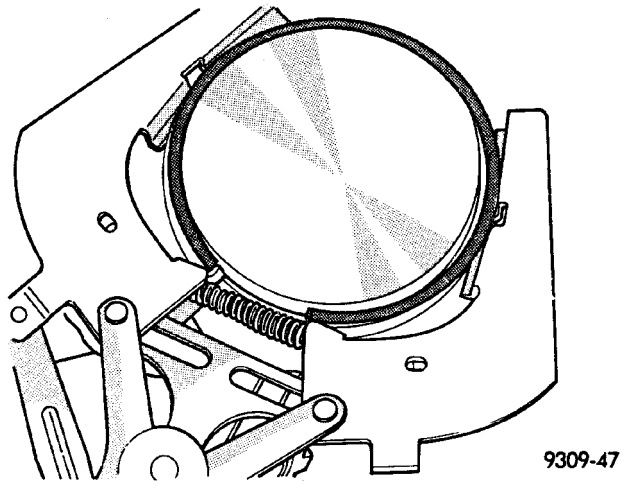

Fig. 58 Upper and Intermediate Rings - Installation

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

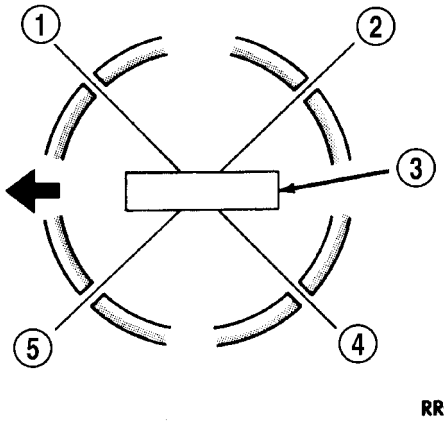

Fig. 59 Piston Ring End Gap Position

1 - SIDE RAIL UPPER
2 - NO. 1 RING GAP
3 - PISTON PIN
4 - SIDE RAIL LOWER
5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

(3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Remove radiator upper hose.

(5) Remove upper fan shroud.

(6) Using Special Tools 6958 Spanner with Adapter Pins 8346, loosen fan and viscous assembly from water pump (Fig. 60).

(7) Remove fan and viscous assembly.

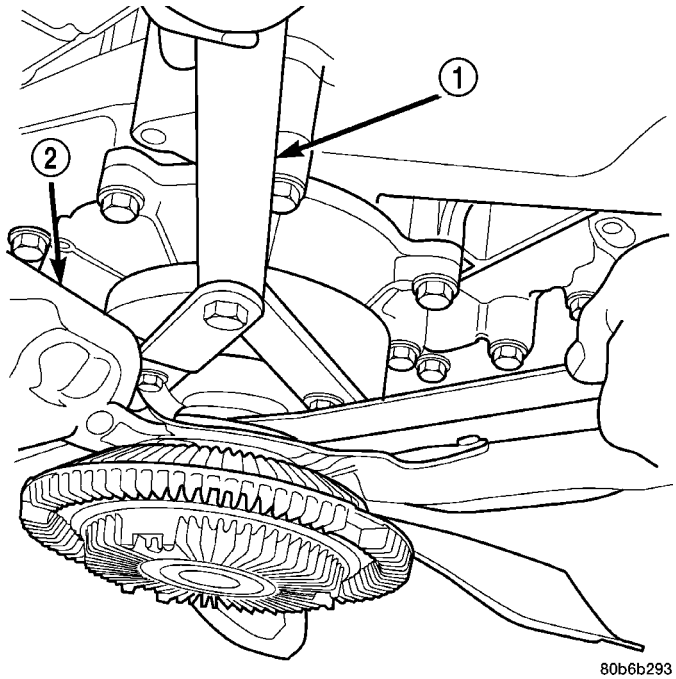

Fig. 60 FAN ASSEMBLY - REMOVAL/ASSEMBLY

1 - SPECIAL TOOL 6958 SPANNER WRENCH WITH ADAPTER PINS 8346
2 - FAN

VIBRATION DAMPER (Continued)

(8) Disconnect electrical connector for fan mounted inside radiator shroud.

NOTE: Transmission cooler line snaps into shroud lower right hand corner.

(9) Remove crankshaft damper bolt.

(10) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 61).

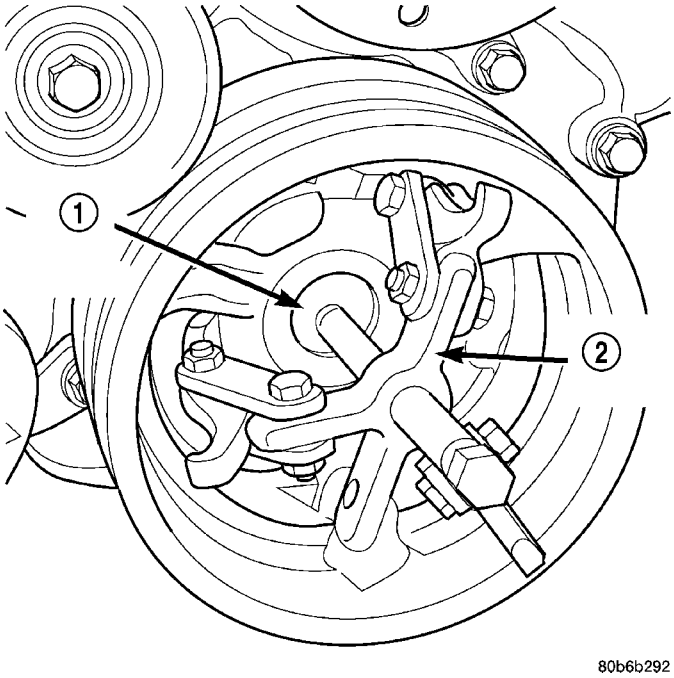

Fig. 61 CRANKSHAFT DAMPER - REMOVAL

1 - SPECIAL TOOL 8513 INSERT
2 - SPECIAL TOOL 1026

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512–A, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(1) Align crankshaft damper slot with key in crankshaft. Slide damper onto crankshaft slightly.

CAUTION: Special Tool 8512–A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

(2) Assemble Special Tool 8512–A as follows, The nut is threaded onto the shaft first. Then the roller bearing is placed onto the threaded rod (The hardened bearing surface of the bearing **MUST**face the nut). Then the hardened washer slides onto the threaded rod (Fig. 62). Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or equivalent.

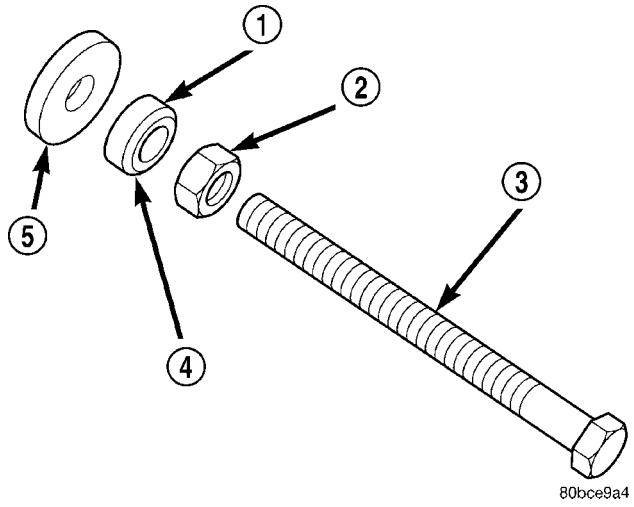

Fig. 62 PROPER ASSEMBLY METHOD FOR SPECIAL TOOL 8512–A

1 - BEARING
2 - NUT
3 - THREADED ROD
4 - BEARING HARDENED SURFACE (FACING NUT)
5 - HARDENED WASHER

(3) Using Special Tool 8512–A, press damper onto crankshaft (Fig. 63).

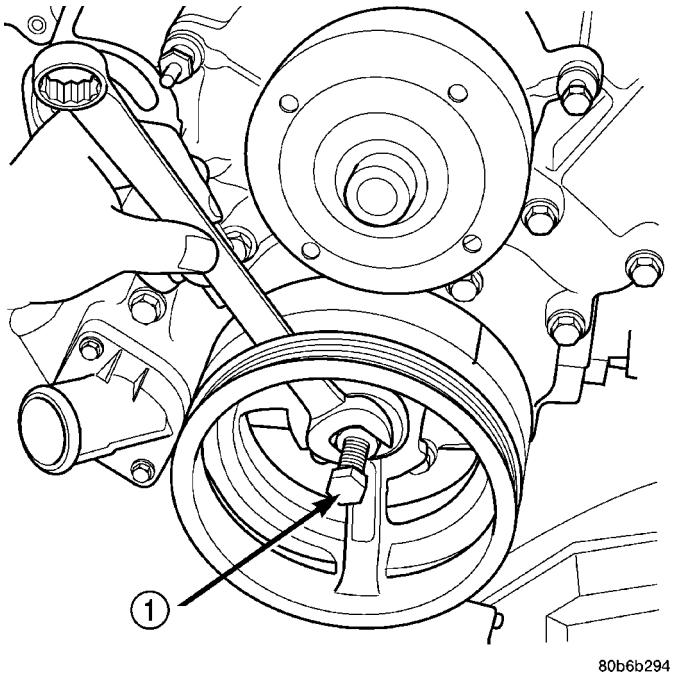

Fig. 63 Crankshaft Damper Installation

1 - SPECIAL TOOL 8512

(4) Install then tighten crankshaft damper bolt to 175 N·m (130 ft. lbs.).

VIBRATION DAMPER (Continued)

(5) Install fan blade assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
(6) Install radiator upper shroud and tighten fasteners to 11 N·m (95 in. lbs.).
(7) Connect electrical connector for shroud fan.
(8) Install radiator upper hose.
(9) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(10) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(11) Connect negative cable to battery.

STRUCTURAL COVER

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine bedplate.

OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove the left hand exhaust pipe from exhaust manifold.
(3) Loosen the right hand exhaust manifold-to-exhaust pipe retaining bolts.
(4) Remove the eight bolts retaining structural cover (Fig. 64) in the sequence shown.
(5) Pivot the exhaust pipe downward and remove the structural cover.

INSTALLATION

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.

(1) Position the structural cover in the vehicle.
(2) Install all four bolts retaining the cover-to-engine. DO NOT tighten the bolts at this time.
(3) Install the four cover-to-transmission bolts. Do NOT tighten at this time.

CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.

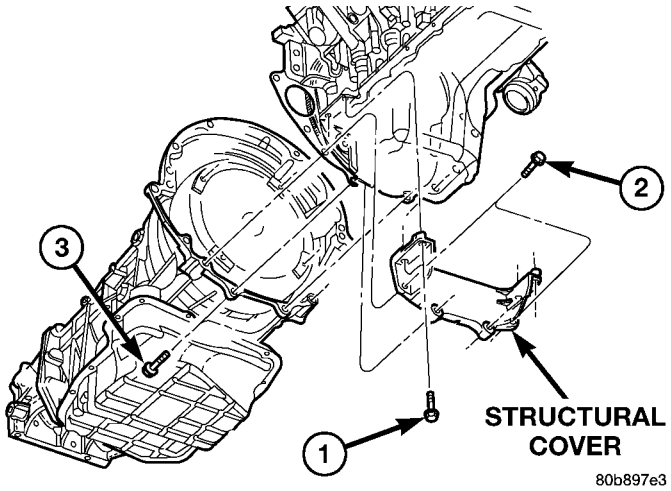

Fig. 64 Structural Cover

1 - BOLT
2 - BOLT
3 - BOLT

(4) Starting with the two rear cover-to-engine bolts, tighten bolts (1) (Fig. 65) to 54 N·m (40 ft. lbs.), then tighten bolts (2) (Fig. 65) and (3) to 54 N·m (40 ft. lbs.) in the sequence shown.

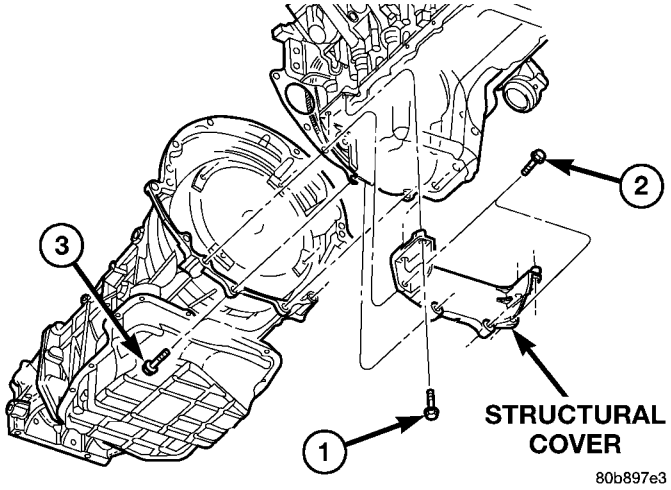

Fig. 65 Structural Cover

1 - BOLT
2 - BOLT
3 - BOLT

(5) Install the exhaust pipe on left hand exhaust manifold.
(6) Tighten exhaust manifold-to-exhaust pipe retaining bolts to 20–26 N·m (15–20 ft. lbs.).

FRONT MOUNT

REMOVAL

2WD

(1) Disconnect the negative cable from the battery.

CAUTION: Remove the viscous fan before raising engine. Failure to do so may cause damage to the fan blade, fan clutch and fan shroud.

(2) Remove the viscous fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(3) Raise the vehicle.
(4) Remove the engine oil filter.
(5) Remove the oil drain trough.
(6) Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.
(7) Support the front axle with a suitable jack.
(8) Remove the (4) bolts that attach the engine mounts to the front axle.
(9) Remove the (3) bolts that attach the front axle to the left engine bracket.
(10) Lower the front axle.
(11) Remove the through bolts
(12) Raise the engine far enough to be able to remove the left and right engine mounts.
(13) Remove the (8) mount to engine attaching bolts
(14) Remove the engine mounts.

4WD

(1) Disconnect the negative cable from the battery.

CAUTION: Remove the viscous fan before raising engine. Failure to do so may cause damage to the fan blade, fan clutch and fan shroud.

(2) Remove the viscous fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(3) Raise the vehicle.
(4) Remove the skid plate.
(5) Remove the front crossmember.
(6) Remove the engine oil filter.
(7) Remove the oil drain trough.
(8) Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.
(9) Support the front axle with a suitable jack.
(10) Remove the (4) bolts that attach the engine mounts to the front axle (Fig. 66).

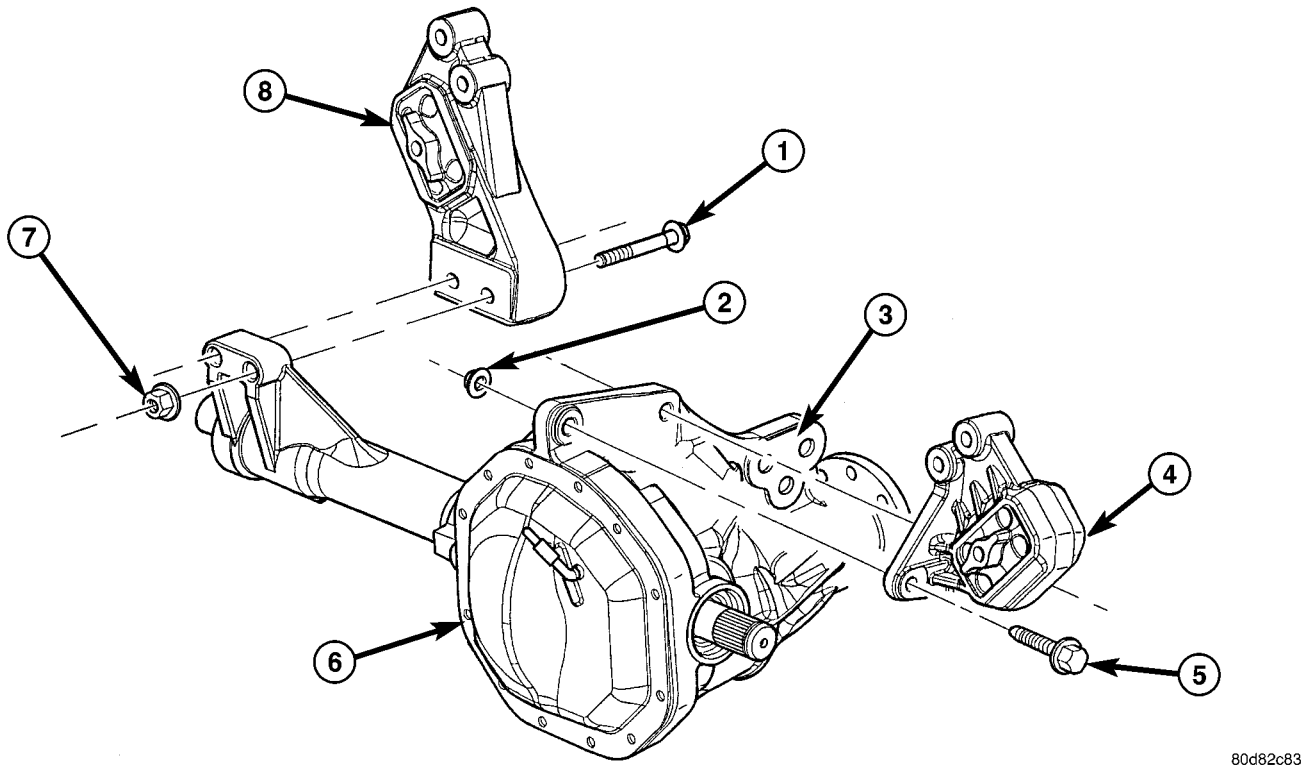

Fig. 66 ENGINE INSULATOR MOUNTS 4X4

8 - RH INSULATOR MOUNT

FRONT MOUNT (Continued)

(11) Remove the (3) bolts that attach the front axle to the left engine bracket.
(12) Lower the front axle.
(13) Remove the (6) through bolts
(14) Raise the engine far enough to be able to remove the left (Fig. 67) and right (Fig. 68) engine mounts.

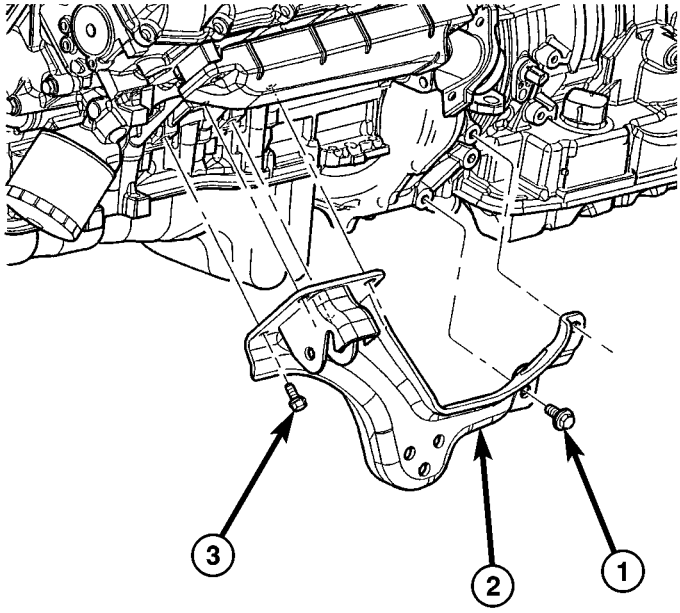

Fig. 67 ENGINE MOUNT SUPPORT BRACKET

1 - BOLT
2 - ENGINE MOUNT SUPPORT BRACKET
3 - BOLT

(15) Remove the engine mounts.

INSTALLATION

2WD

NOTE: For mount to engine block and left engine bracket to front axle bolts, apply Mopar® Lock and Seal Adhesive, Medium Strength Threadlocker.

(1) Install the right and left side engine mounts to the engine block with (8) bolts. Torque bolts to 54 N·m (40 ft. lbs.).
(2) Insert the (2) through bolts into the right and left side engine mounts and loose assemble the two nuts onto the through bolts.
(3) Lower the engine until the through bolts rest onto the slots in the frame brackets.

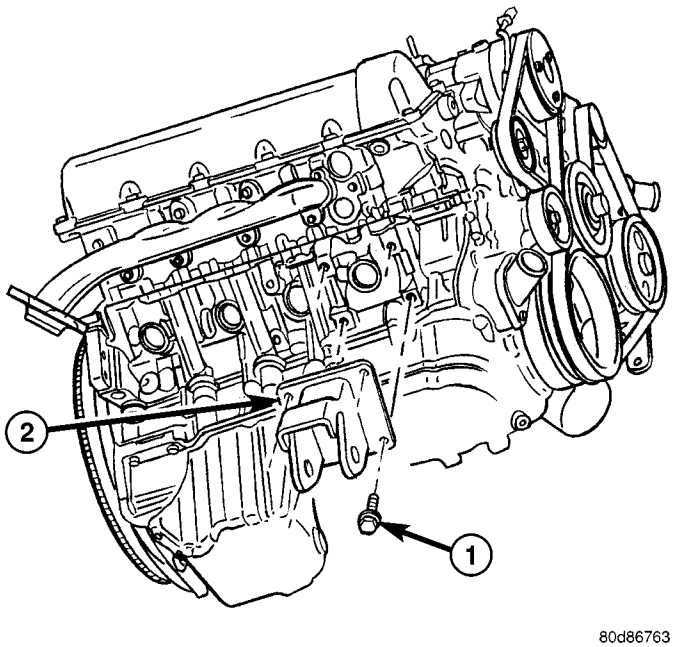

Fig. 68 ENGINE MOUNT SUPPORT BRACKET RH

1 - BOLT
2 - ENGINE MOUNT SUPPORT BRACKET

(4) Tighten the through bolt nuts to 94 N·m (70 ft. lbs.).
(5) Install the oil drain trough.
(6) Install the engine oil filter.
(7) Lower the vehicle.
(8) Install the viscous fan (Refer to 7 - COOLING/ ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(9) Reconnect the negative battery cable.

4WD

NOTE: For mount to engine block and left engine bracket to front axle bolts, apply Mopar® Lock and Seal Adhesive, Medium Strength Threadlocker.

(1) Install the right and left side engine mounts to the front axle. Torque nuts to 94 N·m (70 ft. lbs.).
(2) Raise the front axle into the frame and install the left and right side through bolts. Torque nuts to 94 N·m (70 ft. lbs.).
(3) Insert the two upper through bolts into the right and left side engine mounts and loose assemble the two nuts onto the through bolts.
(4) Lower the engine until the left and right side engine brackets rest on the through bolts, and the lower engine bracket through holes align with the engine mounts, and the left engine bracket holes align with the front axle slots (Fig. 69).
(5) Loose assemble the (3) bolts that attach the front axle to the left engine bracket.

FRONT MOUNT (Continued)

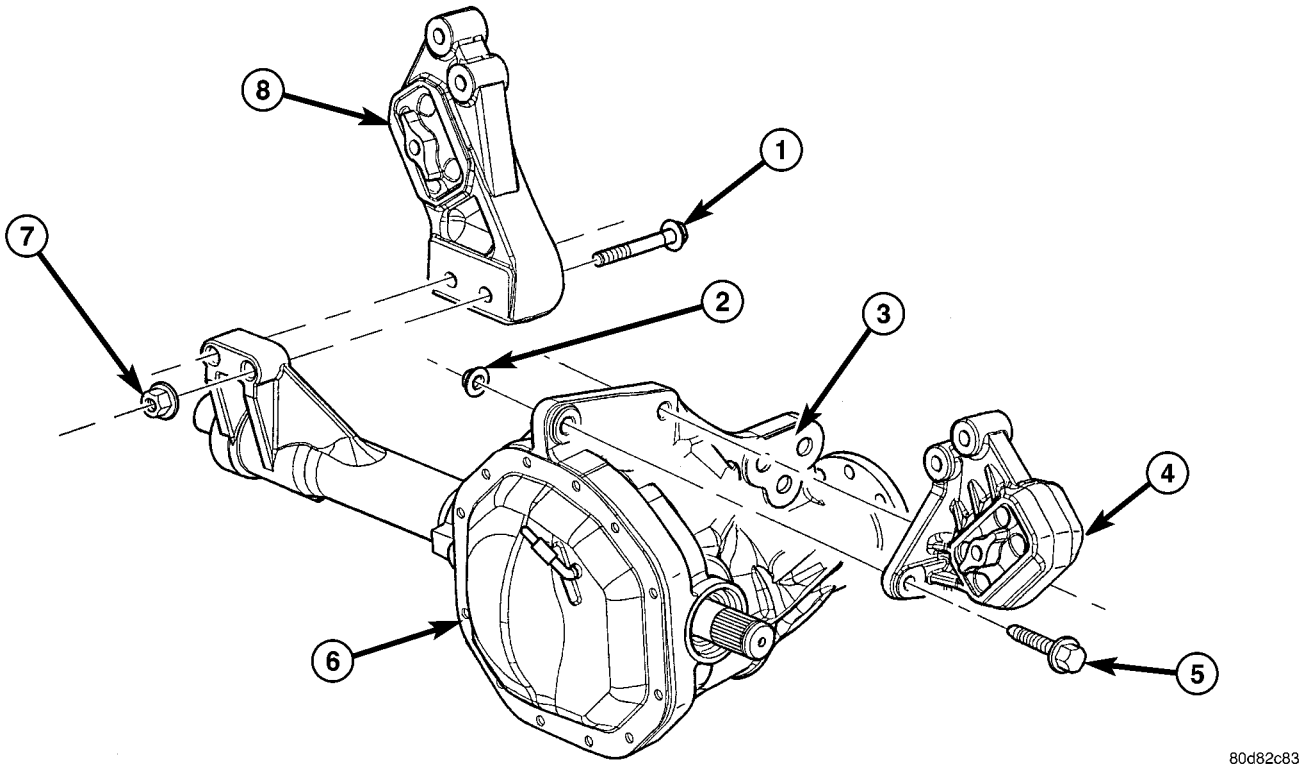

Fig. 69 ENGINE INSULATOR MOUNTS 4X4

1 - RH INSULATOR TO AXLE BOLT
2 - NUT
3 - PINION SUPPORT MOUNT
4 - LH INSULATOR MOUNT
5 - LH INSULATOR TO AXLE BOLT
6 - FRONT AXLE
7 - NUT
8 - RH INSULATOR MOUNT

(6) Loose assemble the lower through bolts.

(7) Torque the nuts for the (4) through bolts to 101 N·m (75 ft. lbs.).

(8) Torque the (3) bolts that attach the front axle to the left engine bracket to 101 N·m (75 ft. lbs.).

(9) Install the oil drain trough.

(10) Install the engine oil filter.

(11) Install the front crossmember.

(12) Install the skid plate.

(13) Lower the vehicle.

(14) Install the viscous fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

(15) Reconnect the negative battery cable.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.
(2) Using a suitable jack, support transmission.
(3) Remove the nuts from the transmission mount (Fig. 70).

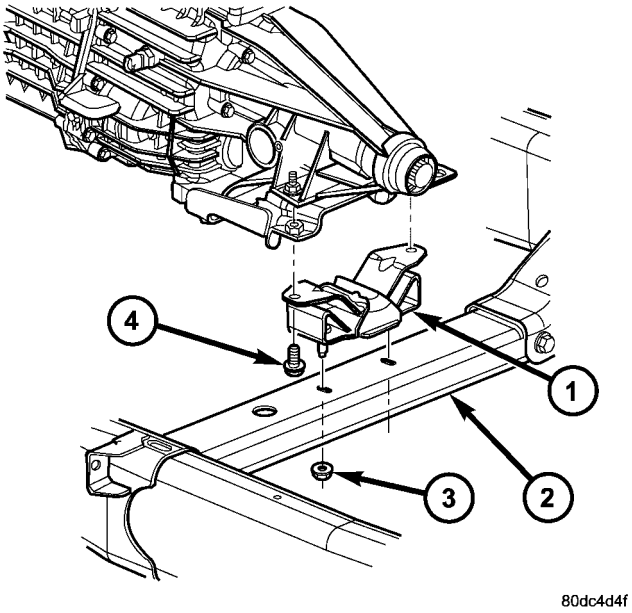

Fig. 70 TRANSMISSION MOUNT

1 - MOUNT
2 - CROSSMEMBER
3 - NUT
4 - BOLT

(4) Remove the two bolts that attach the transmission mount to the engine bracket.
(5) Raise the transmission enough to remove the mount from the crossmember.
(6) Remove the mount.

INSTALLATION

NOTE: Threadlocking compound must be applied to the bolts before installation.

(1) Install the two bolts that attach the transmission mount to the transmission bracket.
(2) Torque the bolts to 61N·m (45 ft.lbs.) torque.
(3) Lower the transmission so the transmission mount rests on the crossmember, and the studs of the transmission mount are aligned in the slots in the crossmember.
(4) Install the nuts onto the transmission mount studs through the crossmember access slot.
(5) Torque the nuts to 54N·m (40 ft. lbs.).

LUBRICATION

DESCRIPTION

The lubrication system is a full flow filtration pressure feed type.

OPERATION

Oil from the oil pan is pumped by a gerotor type oil pump directly mounted to the crankshaft nose. Oil pressure is controlled by a relief valve mounted inside the oil pump housing. For lubrication flow refer to (Fig. 71)

The camshaft exhaust valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Due to the orientation of the rocker arm, the camshaft intake lobes are not lubed in the same manner as the exhaust lobes. The intake lobes are lubed through internal passages in the camshaft. Oil flows through a bore in the No. 3 camshaft bearing bore, and as the camshaft turns, a hole in the camshaft aligns with the hole in the camshaft bore allowing engine oil to enter the camshaft tube. The oil then exits through 1.6mm (0.063 in.) holes drilled into the intake lobes, lubricating the lobes and the rocker arms.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.If the oil leak source is not positively identified at this time, proceed with the air leak detection test method.

Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(5) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

LUBRICATION (Continued)

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit (Fig. 72)and install gauge assembly C-3292.

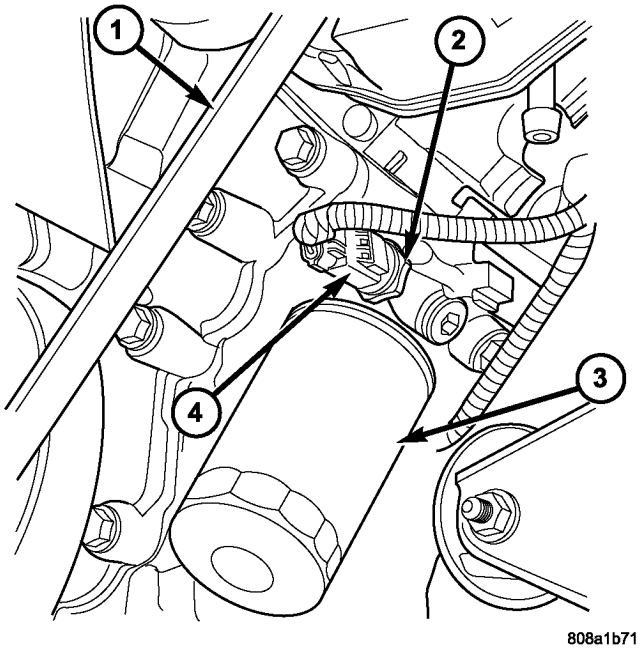

Fig. 72 OIL PRESSURE SENDING UNIT -TYPICAL

1 - BELT
2 - OIL PRESSURE SENSOR
3 - OIL FILTER
4 - ELEC. CONNECTOR

(2) Run engine until thermostat opens.
(3) Oil Pressure:
- Curb Idle - 25 kPa (4 psi) minimum
- 3000 rpm - 170 - 758 kPa (25 - 110 psi)

(4) If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.
(2) Raise the vehicle.
(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
   (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
   (b) Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.
(4) If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.
(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

OIL PAN

DESCRIPTION

The engine oil pan is made of laminated steel and has a single plane sealing surface. The sandwich style oil pan gasket has an integrated windage tray and steel carrier (Fig. 73). The sealing area of the gasket is molded with rubber and is designed to be reused as long as the gasket is not cut, torn or ripped.

REMOVAL

(1) Disconnect the negative battery cable.
(2) Install engine support fixture special tool # 8534. **Do not raise engine at this time.**
(3) Loosen both left and right side engine mount through bolts. Do not remove bolts.
(4) Remove the structural dust cover, if equipped.
(5) Drain engine oil.
(6) Remove the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - REMOVAL).

CAUTION: Only raise the engine enough to provide clearance for oil pan removal. Check for proper clearance at fan shroud to fan and cowl to intake manifold.

(7) Raise engine using special tool 8534 to provide clearance to remove oil pan.

NOTE: Do not pry on oil pan or oil pan gasket. Gasket is integral to engine windage tray and does not come out with oil pan.

(8) Remove the oil pan mounting bolts and oil pan.
(9) Unbolt oil pump pickup tube and remove tube.
(10) Inspect the integral windage tray (Fig. 73) and gasket and replace as needed.

CLEANING

(1) Clean oil pan in solvent and wipe dry with a clean cloth.
(2) Clean the oil pan gasket surface. **DO NOT** use a grinder wheel or other abrasive tool to clean sealing surface.
(3) Clean oil screen and tube thoroughly in clean solvent.

INSPECTION

(1) Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.
(2) Inspect the oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

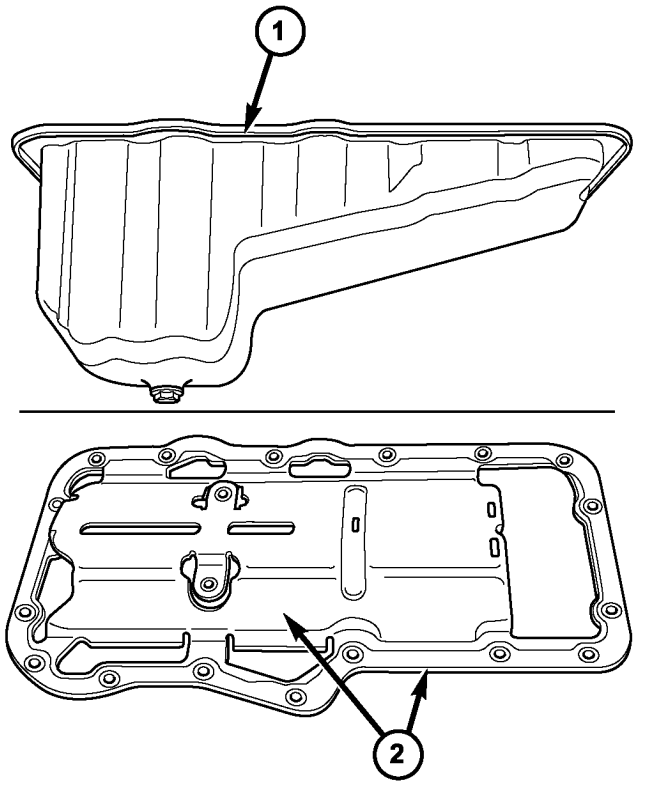

Fig. 73 Oil Pan And Gasket

1 - OIL PAN
2 - WINDAGE TRAY AND INTEGRATED OIL PAN GASKET

INSTALLATION

(1) Clean the oil pan gasket mating surface of the bedplate and oil pan.
(2) Inspect integrated oil pan gasket, and replace as necessary.
(3) Position the integrated oil pan gasket/windage tray assembly.
(4) Install the oil pickup tube
(5) Install the mounting bolt and nuts. Tighten nuts to 28 N·m (20 ft. lbs.).
(6) If removed, install stud at position No. 9. (Fig. 74).
(7) Position the oil pan and install the mounting bolts and nut. Tighten the mounting bolts and nut to 15 N·m (11 ft. lbs.) in the sequence shown (Fig. 74).
(8) Lower the engine into mounts using special tool 8534.
(9) Install both the left and right side engine mount through bolts. Tighten the nuts to 68 N·m (50 ft. lbs.).
(10) Remove special tool 8534.
(11) Install structural dust cover, if equipped.

OIL PAN (Continued)

(12) Install the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - INSTALLATION).
(13) Fill engine oil.
(14) Reconnect the negative battery cable.
(15) Start engine and check for leaks.

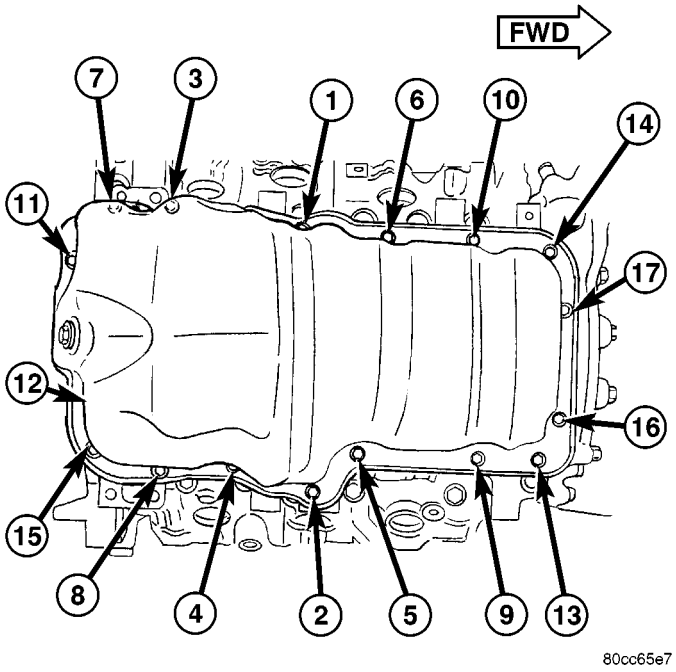

Fig. 74 Oil Pan Mounting Bolt Sequence

OIL PRESSURE SENSOR/ SWITCH

DESCRIPTION

The 3 wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5 volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3 wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5 volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Raise vehicle on hoist.
(3) Remove front splash shield.
(4) Disconnect oil pressure sender wire (Fig. 75).
(5) Remove the pressure sender (Fig. 75).

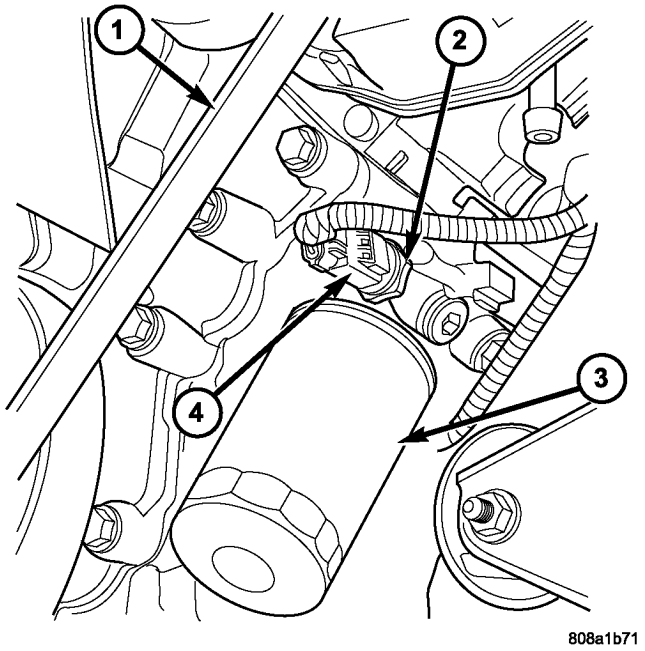

Fig. 75 OIL PRESSURE SENDING UNIT

1 - BELT
2 - OIL PRESSURE SENSOR
3 - OIL FILTER
4 - ELEC. CONNECTOR

INSTALLATION

(1) Install oil pressure sender.
(2) Connect oil pressure sender wire.
(3) Install front splash shield.
(4) Lower vehicle.
(5) Connect the negative battery cable.

OIL PUMP

REMOVAL

(1) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(2) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

OIL PUMP (Continued)

(3) Remove the timing chains and tensioners (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(4) Remove the four bolts, primary timing chain tensioner and the oil pump.

DISASSEMBLY

(1) Remove oil pump cover screws and lift off cover plate.

(2) Remove pump inner and outer rotors.

NOTE: Once the oil pressure relief valve, cup plug, and pin are removed, the pump assembly must be replaced.

(3) If it is necessary to remove the pressure relief valve, drive the roll pin from pump housing and remove cup plug, spring and valve.

INSPECTION

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

(1) Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.

(2) Lay a straight edge across the pump cover surface (Fig. 76). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between the cover and the straight edge the oil pump assembly should be replaced.

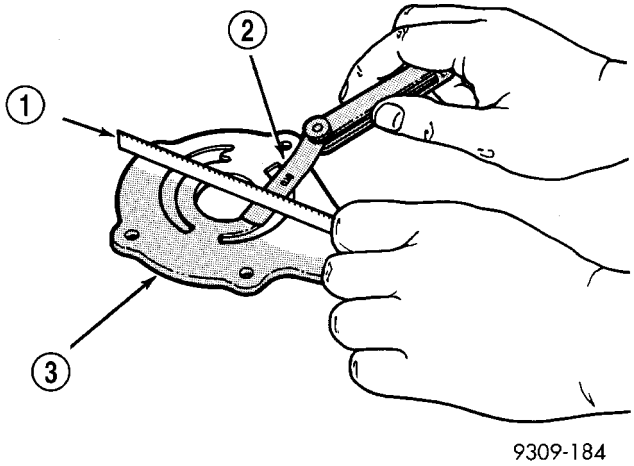

Fig. 76 Checking Oil Pump Cover Flatness

1 - STRAIGHT EDGE
2 - FEELER GAUGE
3 - OIL PUMP COVER

(3) Measure the thickness of the outer rotor (Fig. 77). If the outer rotor thickness measures at 12.005 mm (0.472 in.) or less the oil pump assembly must be replaced.

(4) Measure the diameter of the outer rotor. If the outer rotor diameter measures at 85.925 mm (3.382 in.) or less the oil pump assembly must be replaced.

(5) Measure the thickness of the inner rotor (Fig. 78). If the inner rotor thickness measures at 12.005 mm (0.472 in.) or less then the oil pump assembly must be replaced.

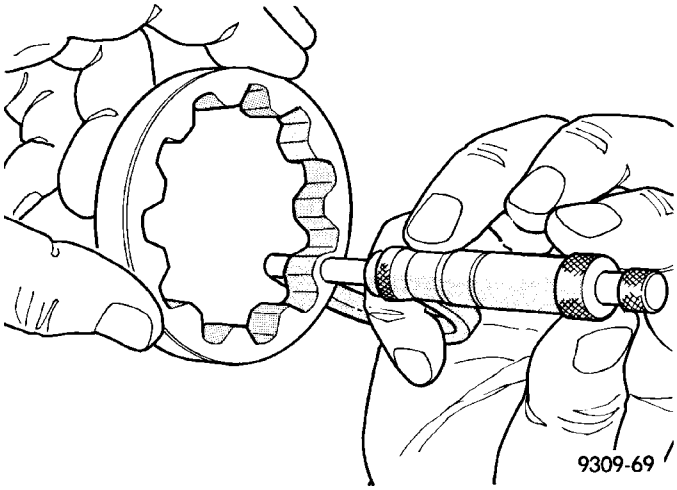

Fig. 77 Measuring Outer Rotor Thickness

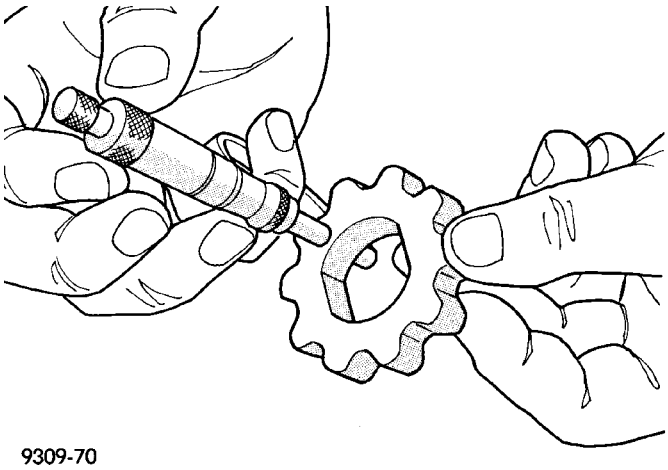

Fig. 78 Measuring Inner Rotor Thickness

OIL PUMP (Continued)

(6) Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body (Fig. 79). If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.

(7) Install the inner rotor in the into the oil pump body. Measure the clearance between the inner and outer rotors (Fig. 80). If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

(8) Place a straight edge across the body of the oil pump (between the bolt holes), if a feeler gauge of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced (Fig. 81).

NOTE: The 3.7 Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

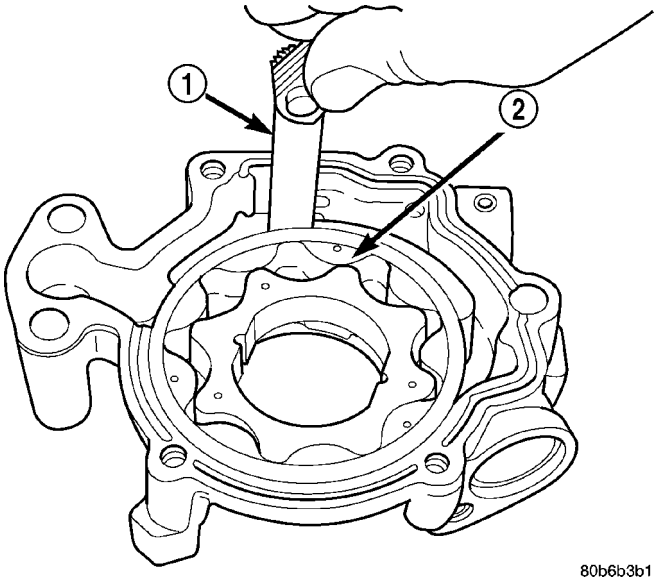

Fig. 79 Measuring Outer Rotor Clearance

1 - FEELER GAUGE
2 - OUTER ROTOR

ASSEMBLY

(1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

(2) Install inner and outer rotors

(3) Install oil pump cover plate and install cover bolts and tighten them to 12 N·m (105 in. lbs.).

(4) Prime oil pump before installation by filling rotor cavity with engine oil.

(5) If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other causes for oil pressure loss.

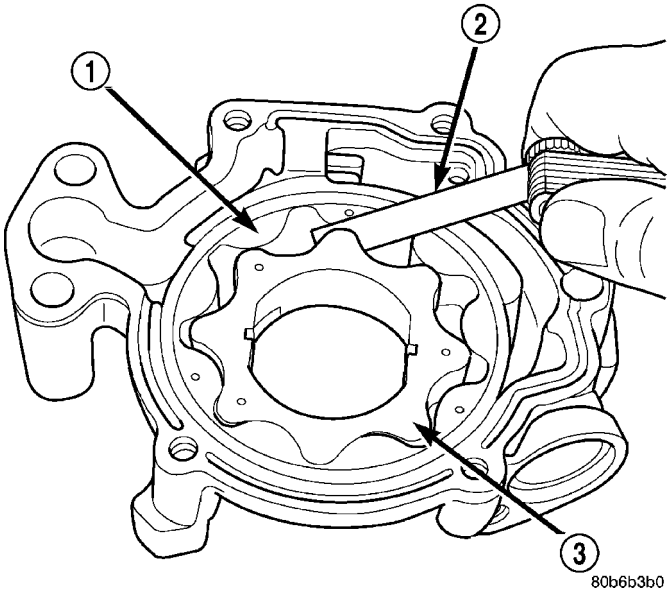

Fig. 80 Measuring Clearance Between Rotors

1 - OUTER ROTOR
2 - FEELER GAUGE
3 - INNER ROTOR

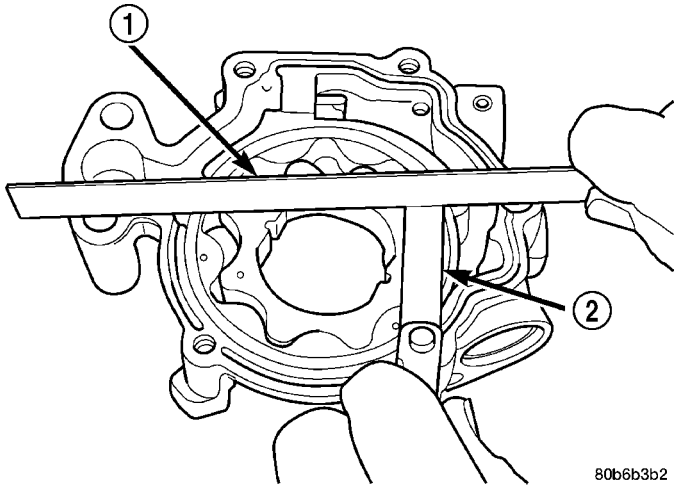

Fig. 81 Measuring Clearance Over Rotors

1 - STRAIGHT EDGE
2 - FEELER GAUGE

INSTALLATION

(1) Position the oil pump onto the crankshaft and install one oil pump retaining bolts.

(2) Position the primary timing chain tensioner and install three retaining bolts.

(3) Tighten the oil pump and primary timing chain tensioner retaining bolts to 28 N·m (250 in. lbs.) in the sequence shown (Fig. 82).

(4) Install the secondary timing chain tensioners and timing chains (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

OIL PUMP (Continued)

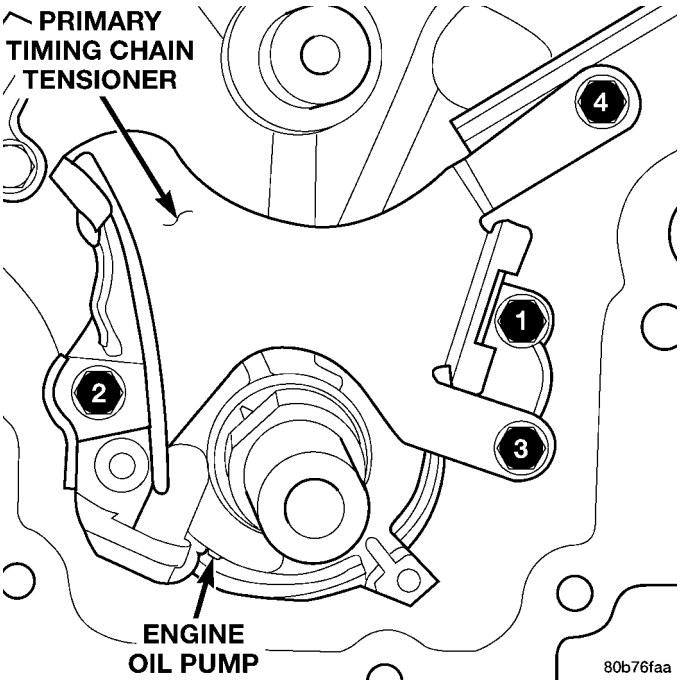

Fig. 82 Oil Pump And Primary Timing Chain Tensioner Tightening Sequence

(5) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(6) Install the pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise (Fig. 83) to remove it from the cylinder block oil filter boss.

(4) When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: Make sure filter gasket was removed with filter.

(5) With a wiping cloth, clean the gasket sealing surface of oil and grime.

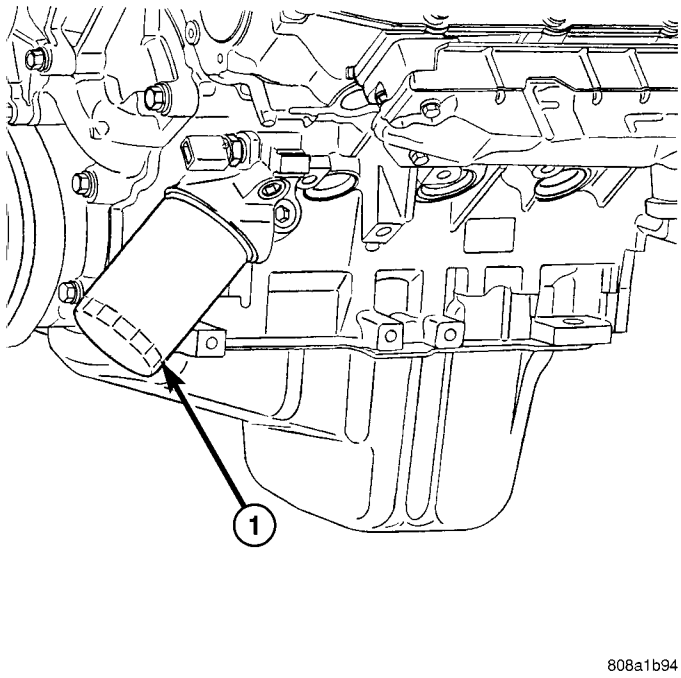

Fig. 83 OIL FILTER

1 - ENGINE OIL FILTER

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 84) hand tighten filter one full turn, do not over tighten.

(3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

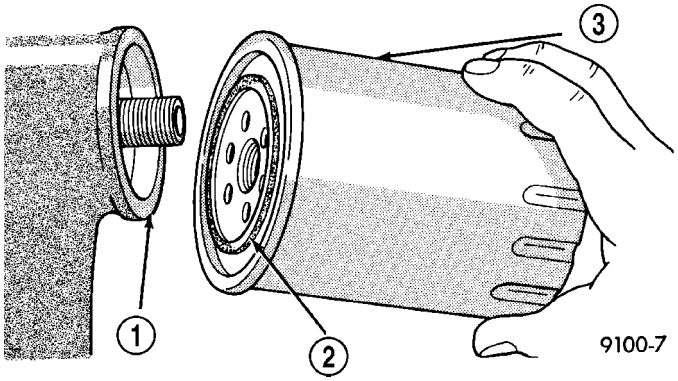

Fig. 84 Oil Filter Sealing Surface-Typical

1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

OIL

STANDARD PROCEDURE - ENGINE OIL SERVICE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30 in the 3.7L engines. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 85).

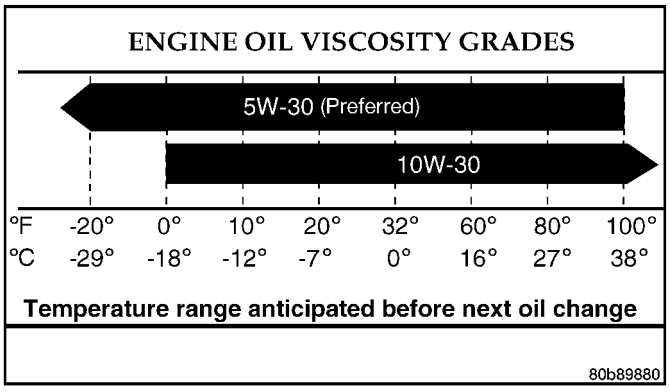

Fig. 85 TEMPERATURE/ENGINE OIL VISCOSITY - 3.7L ENGINE

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 86).

9400-9

Fig. 86 Engine Oil Container Standard Notations

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located at the right rear of the engine on the 3.7L engines. (Fig. 87).

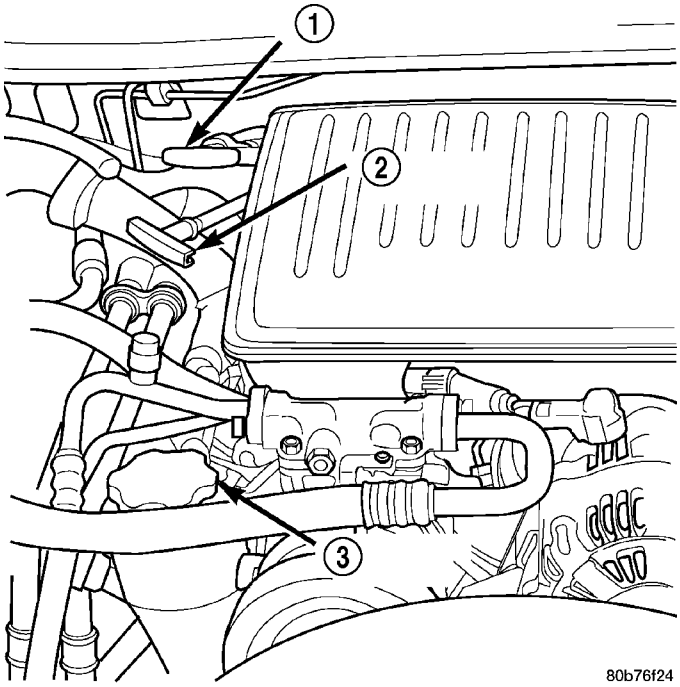

Fig. 87 ENGINE OIL DIPSTICK 3.7L ENGINE

1 - TRANSMISSION DIPSTICK
2 - ENGINE OIL DIPSTICK
3 - ENGINE OIL FILL CAP

OIL (Continued)

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

(1) Position vehicle on level surface.
(2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
(3) Wipe dipstick clean.
(4) Install dipstick and verify it is seated in the tube.
(5) Remove dipstick, with handle held above the tip, take oil level reading.
(6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.
(2) Hoist and support vehicle on safety stands.
(3) Remove oil fill cap.
(4) Place a suitable drain pan under crankcase drain.
(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
(6) Install drain plug in crankcase.
(7) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.
(8) Install oil fill cap.
(9) Start engine and inspect for leaks.
(10) Stop engine and inspect oil level.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

INTAKE MANIFOLD

DESCRIPTION

The intake manifold (Fig. 88) is made of a composite material and features 300 mm (11.811 in.) long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of six individual press in place port gaskets to prevent leaks. The throttle body attaches directly to the intake manifold. Eight studs and two bolts are used to fasten the intake to the head.

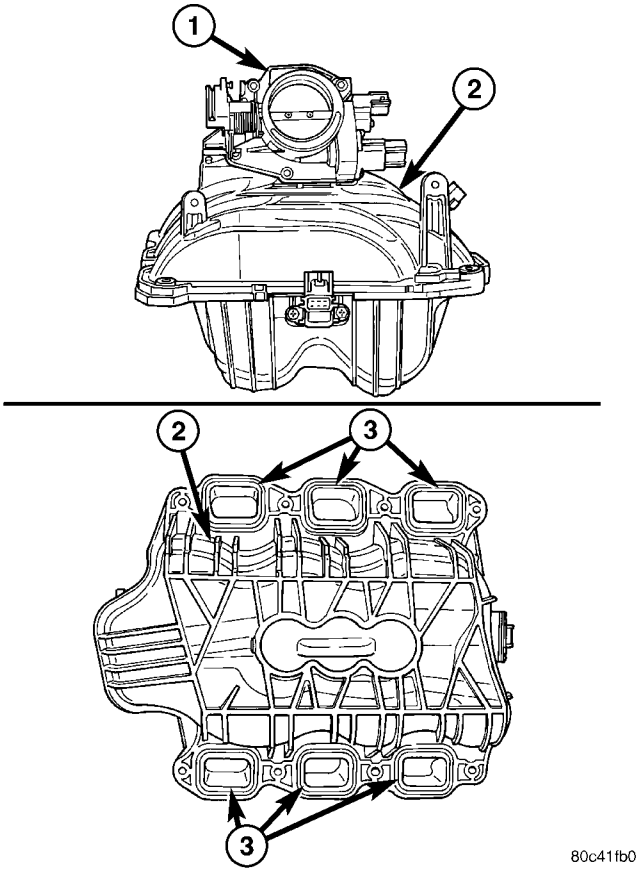

Fig. 88 Intake Manifold

1 - THROTTLE BODY
2 - INTAKE MANIFOLD
3 - INTAKE PORT GASKETS

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

INTAKE MANIFOLD (Continued)

(1) Start the engine.
(2) Spray a small stream of water (spray bottle) at the suspected leak area.
(3) If engine RPM'S change, the area of the suspected leak has been found.
(4) Repair as required.

REMOVAL

(1) Disconnect negative cable from battery.
(2) Remove resonator assembly and air inlet hose.
(3) Disconnect throttle and speed control cables.
(4) Disconnect electrical connectors for the following components: Refer to FUEL SYSTEM for component locations.
- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor

(5) Disconnect vapor purge hose, brake booster hose, speed control servo hose, positive crankcase ventilation (PCV) hose.
(6) Disconnect generator electrical connections.
(7) Disconnect air conditioning compressor electrical connections.
(8) Disconnect left and right radio suppressor straps.
(9) Disconnect and remove ignition coil towers.
(10) Remove top oil dipstick tube retaining bolt and ground strap.
(11) Bleed fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
(12) Remove fuel rail.
(13) Remove throttle body assembly and mounting bracket.
(14) Drain cooling system below coolant temperature level (Refer to 7 - COOLING - STANDARD PROCEDURE).
(15) Remove the heater hoses from the engine front cover and the heater core.
(16) Unclip and remove heater hoses and tubes from intake manifold.
(17) Remove coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMP SENSOR - REMOVAL).
(18) Remove intake manifold retaining fasteners in reverse order of tightening sequence.
(19) Remove intake manifold.

INSTALLATION

(1) Install intake manifold gaskets.
(2) Install intake manifold.
(3) Install intake manifold retaining bolts and tighten in sequence shown in to 12 N·m (105 in. lbs.) (Fig. 89).

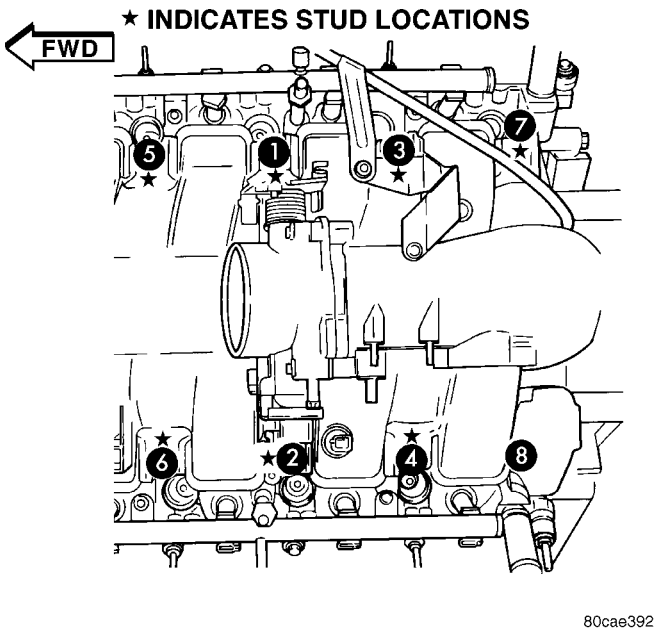

Fig. 89 Intake Manifold Tightening Sequence

(4) Install left and right radio suppressor straps.
(5) Install throttle body assembly.
(6) Connect throttle cable and speed control cable to throttle body.
(7) Install fuel rail.
(8) Install ignition coil towers.
(9) Position and install heater hoses and tubes onto intake manifold.
(10) Install the heater hoses to the heater core and engine front cover.
(11) Connect electrical connectors for the following components:
- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor
- Ignition coil towers
- Fuel injectors

(12) Install top oil dipstick tube retaining bolt and ground strap.
(13) Connect generator electrical connections.
(14) Connect Vapor purge hose, Brake booster hose, Speed control servo hose, Positive crankcase ventilation (PCV) hose.
(15) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(16) Install resonator assembly and air inlet hose.
(17) Connect negative cable to battery.

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds (Fig. 90) are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields (Fig. 91) are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

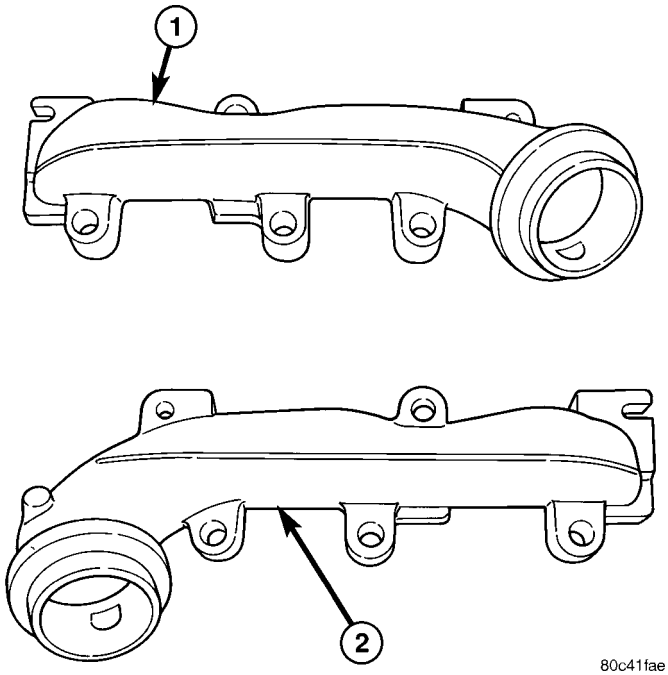

Fig. 90 EXHAUST MANIFOLDS

1 - LEFT SIDE EXHAUST MANIFOLD
2 - RIGHT SIDE EXHAUST MANIFOLD

REMOVAL

RIGHT EXHAUST MANIFOLD

(1) Disconnect the negative cable from the battery.
(2) Raise and support the vehicle.
(3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
(4) Lower the vehicle.
(5) Remove the exhaust heat shield (Fig. 92).
(6) Remove bolts, nuts and washers attaching manifold to cylinder head.
(7) Remove manifold and gasket from the cylinder head.

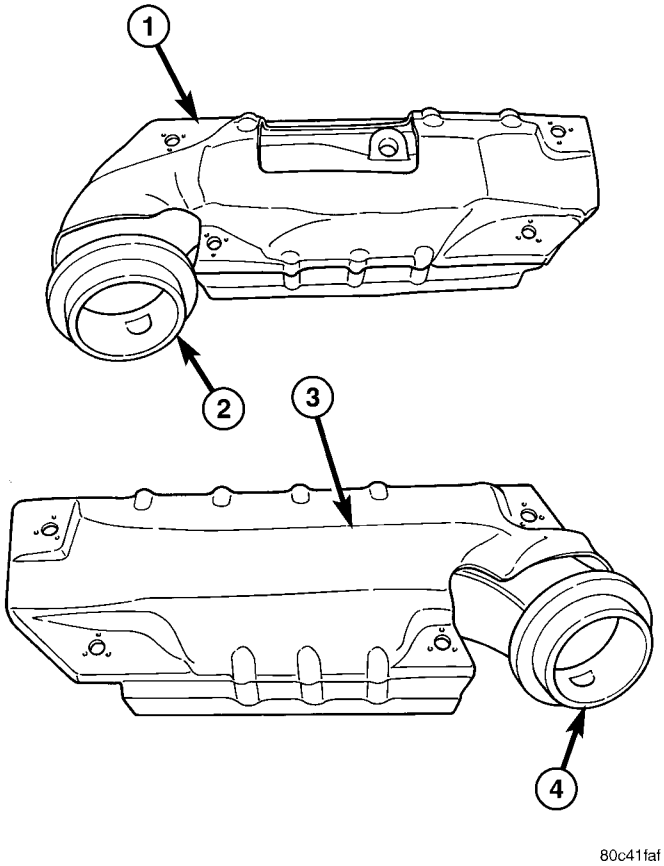

Fig. 91 Exhaust Manifold Heat Shields

1 - RIGHT SIDE EXHAUST MANIFOLD HEAT SHIELD
2 - RIGHT SIDE EXHAUST MANIFOLD FLANGE
3 - LEFT SIDE EXHAUST MANIFOLD HEAT SHIELD
4 - LEFT SIDE EXHAUST MANIFOLD FLANGE

LEFT EXHAUST MANIFOLD

(1) Disconnect the negative cable from the battery.
(2) Raise and support the vehicle.
(3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
(4) Lower the vehicle.
(5) Remove the exhaust heat shields (Fig. 93).
(6) Remove bolts, nuts and washers attaching manifold to cylinder head.
(7) Remove manifold and gasket from the cylinder head.

INSTALLATION

RIGHT EXHAUST MANIFOLD

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

EXHAUST MANIFOLD (Continued)

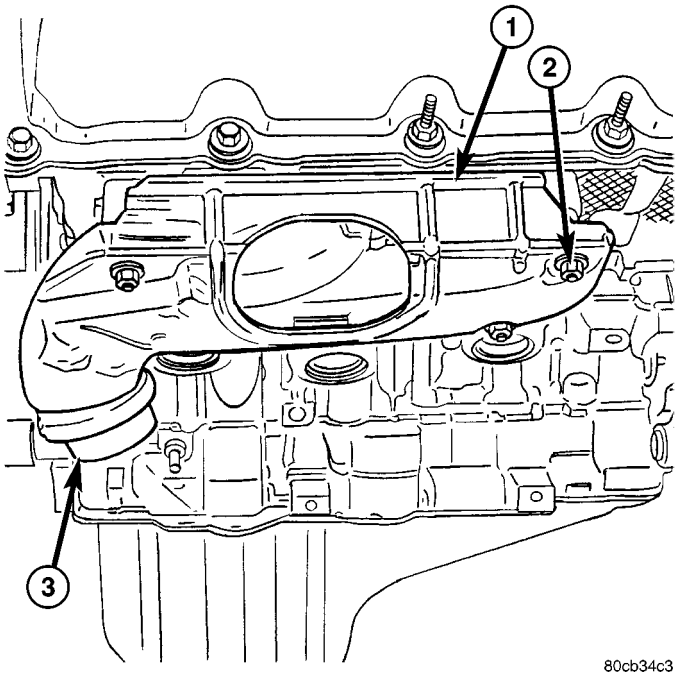

Fig. 92 Exhaust Manifold Right

1 - HEAT SHIELD
2 - NUTS
3 - MANIFOLD FLANGE

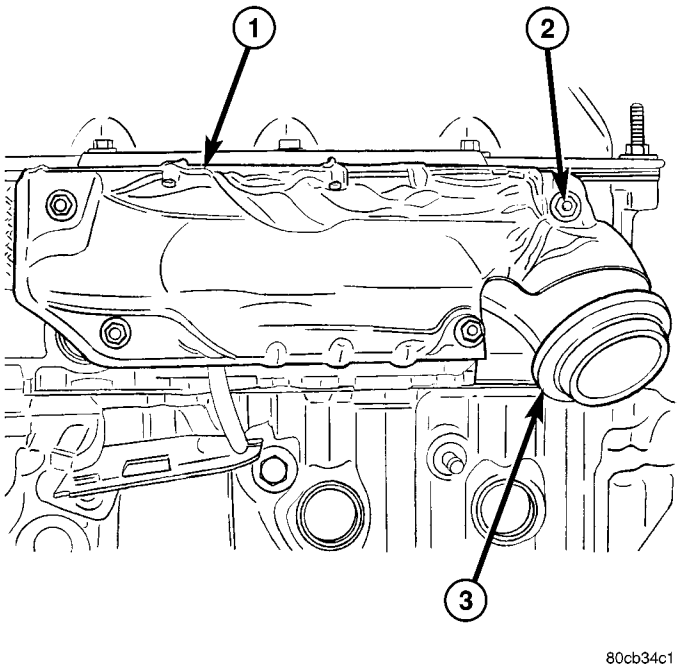

Fig. 93 Exhaust Manifold left

1 - HEAT SHIELD
2 - NUTS
3 - MANIFOLD FLANGE

(1) Position the engine exhaust manifold and gasket on the two studs located on the cylinder head. Install conical washers and nuts on these studs .

(2) Install remaining conical washers. Starting at the center arm and working outward, tighten the bolts and nuts to 25 N·m (18 ft. lbs.) torque.

(3) Install the exhaust heat shields.

(4) Raise and support the vehicle.

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

(5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

LEFT EXHAUST MANIFOLD

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

(1) Position the engine exhaust manifold and gasket on the two studs located on the cylinder head. Install conical washers and nuts on these studs .

(2) Install remaining conical washers. Starting at the center arm and working outward, tighten the bolts and nuts to 25 N·m (18 ft. lbs.) torque.

(3) Install the exhaust heat shields.

(4) Raise and support the vehicle.

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

(5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

VALVE TIMING

DESCRIPTION

The timing drive system has been designed to provide quiet performance and reliability to support a **non-free wheeling** engine. Specifically the intake valves are non-free wheeling and can be easily damaged with forceful engine rotation if camshaft-to-crankshaft timing is incorrect. The timing drive system consists of a primary chain, two secondary timing chain drives (Fig. 94) and a counterbalance shaft drive.

OPERATION

The primary timing chain is a single inverted tooth chain type. The primary chain drives the large 50 tooth idler sprocket directly from a 25 tooth crankshaft sprocket. Primary chain motion is controlled by a pivoting leaf spring tensioner arm and a fixed guide. The arm and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication from the secondary chain drive and designed oil pump leakage. The idler sprocket assembly connects the primary chain drive, secondary chain drives, and the counterbalance shaft. The idler sprocket assembly consists of two integral 26 tooth sprockets a 50 tooth sprocket and a helical gear that is press-fit to the assembly. The spline joint for the 50 tooth sprocket is a non serviceable press fit anti rattle type. A spiral ring is installed on the outboard side of the 50 tooth sprocket to prevent spline disengagement. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is a light press-fit into the cylinder

9 - PRIMARY CHAIN TENSIONER

VALVE TIMING (Continued)

block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the two bushings used in the idler sprocket assembly.

There are two secondary drive chains, both are roller type, one to drive the camshaft in each SOHC cylinder head. There are no shaft speed changes in the secondary chain drive system. Each secondary chain drives a 26 tooth cam sprocket directly from the 26 tooth sprocket on the idler sprocket assembly. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The hydraulic tensioners for the secondary chain systems are fed pressurized oil from oil reservoir pockets in the block. Each tensioner incorporates a controlled leak path through a device known as a vent disc located in the nose of the piston to manage chain loads. Each tensioner also has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The secondary timing chains receive lubrication from a small orifice in the tensioners. This orifice is protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE

MEASURING TIMING CHAIN WEAR

NOTE: This procedure must be performed with the timing chain cover removed.

(1) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(2) To determine if the secondary timing chains are worn, rotate the engine clockwise until maximum tensioner piston extension is obtained. Measure the distance between the secondary timing chain tensioner housing and the step ledge on the piston. The measurement at point (A) must be less than 15mm (.5906 inches) (Fig. 95).

(3) If the measurement exceeds the specification the secondary timing chains are worn and require replacement (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

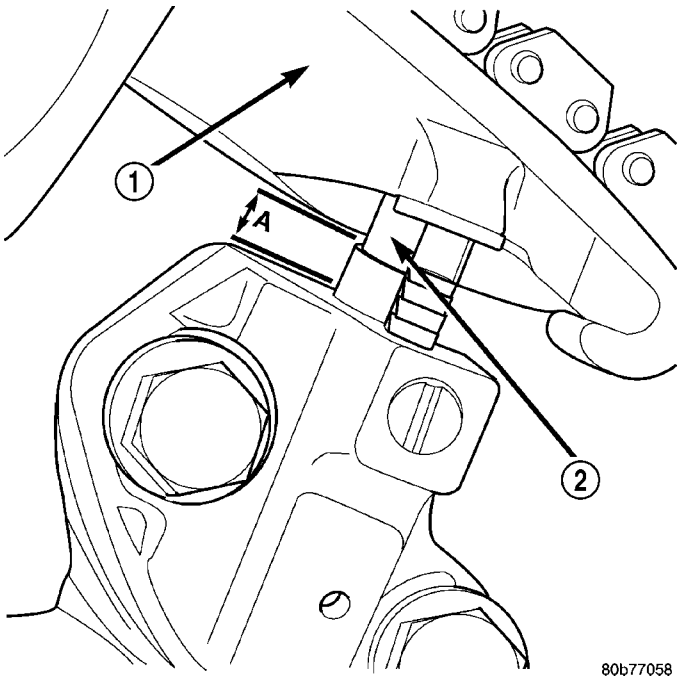

Fig. 95 Measuring Secondary Timing Chains For Wear

1 - SECONDARY TENSIONER ARM
2 - SECONDARY CHAIN TENSIONER PISTON

SERVICE PROCEDURE - TIMING VERIFICATION

CAUTION: The 3.7L is a non free-wheeling design engine. Therefore, correct engine timing is critical.

NOTE: Components referred to as left hand or right hand are as viewed from the drivers position inside the vehicle.

NOTE: The blue link plates on the chains and the dots on the camshaft drive sprockets may not line up during the timing verification procedure. The blue link plates are lined up with the sprocket dots only when re-timing the complete timing drive. Once the timing drive is rotated blue link-to-dot alignment is no longer valid.

Engine base timing can be verified by the following procedure:

(1) Remove the cylinder head covers. Refer to the procedure in this section.

VALVE TIMING (Continued)

(2) Using a mirror, locate the TDC arrow on the front cover (Fig. 96). Rotate the crankshaft until the mark on the crankshaft damper is aligned with the TDC arrow on the front cover. The engine is now at TDC.

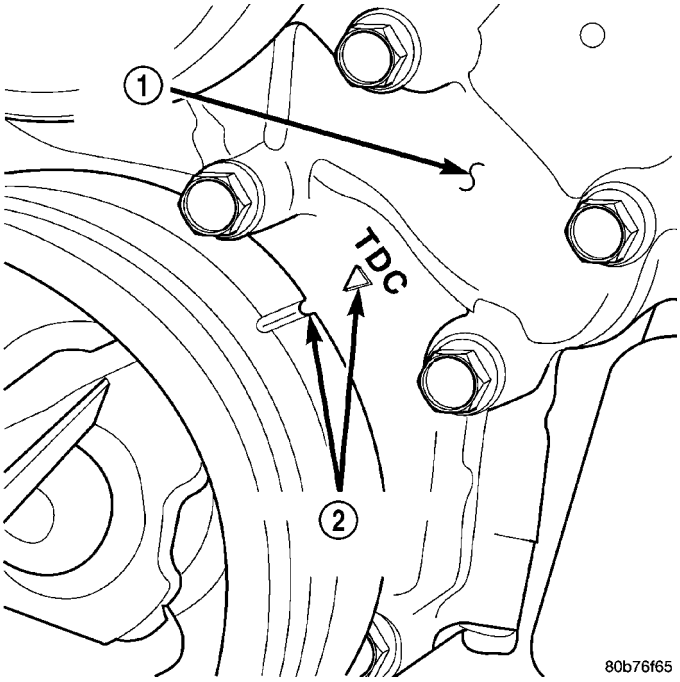

Fig. 96 Engine Top Dead Center (TDC) Indicator Mark

1 - TIMING CHAIN COVER
2 - CRANKSHAFT TIMING MARKS

(3) Note the location of the V6 mark stamped into the camshaft drive gears. If the V6 mark on each camshaft drive gear is at the twelve o'clock position, the engine is at TDC on the exhaust stroke. If the V6 mark on each gear is at the six o'clock position, the engine is at TDC on the compression stroke. (Fig. 100)

(4) If both of the camshaft drive gears are off in the same or opposite directions, the primary chain or both secondary chains are at fault. Refer to Timing Chain and Sprockets procedure in this section.

(5) If only one of the camshaft drive gears is off and the other is correct, the problem is confined to one secondary chain. Refer to Single camshaft timing, in this procedure.

(6) If both camshaft drive gear V6 marks are at the twelve o'clock or the six o'clock position the engine base timing is correct. Reinstall the cylinder head covers.

COUNTER BALANCE SHAFT TIMING

(1) Ensure that the engine is at TDC with both camshaft sprocket V6 marks in the 12 o'clock position. (Fig. 100)

(2) Look down the left cylinder head chain cavity. The timing dot on the counter balance shaft drive gear should be in the 6 o'clock position (Fig. 97).

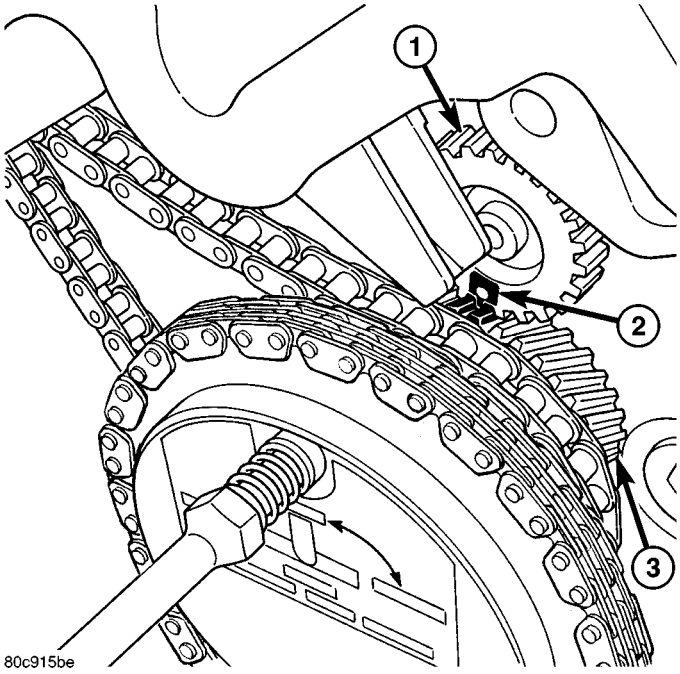

Fig. 97 COUNTERBALANCE SHAFT ALIGNMENT MARKS

1 - COUNTERBALANCE SHAFT GEAR
2 - TIMING MARK
3 - IDLER SPROCKET GEAR

TIMING - SINGLE CAMSHAFT

NOTE: to adjust the timing on one camshaft, preform the following procedure.

(1) Using Chain Tensioner Wedge (Fig. 99), Special Tool 8379, stabilize the secondary chain drive. For reference purposes, mark the chain-to-sprocket position. (Fig. 98)

(2) Remove the camshaft drive gear retaining bolt.

(3) Carefully remove the camshaft drive gear from the camshaft.

(4) Re-index the camshaft drive gear in the chain until the V6 mark is at the same position as the V6 mark on the opposite camshaft drive gear.

(5) Using Special Tool 8428 Camshaft Wrench, rotate the camshaft until the alignment dowel on the camshaft is aligned with the slot in the camshaft drive gear.

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.

VALVE TIMING (Continued)

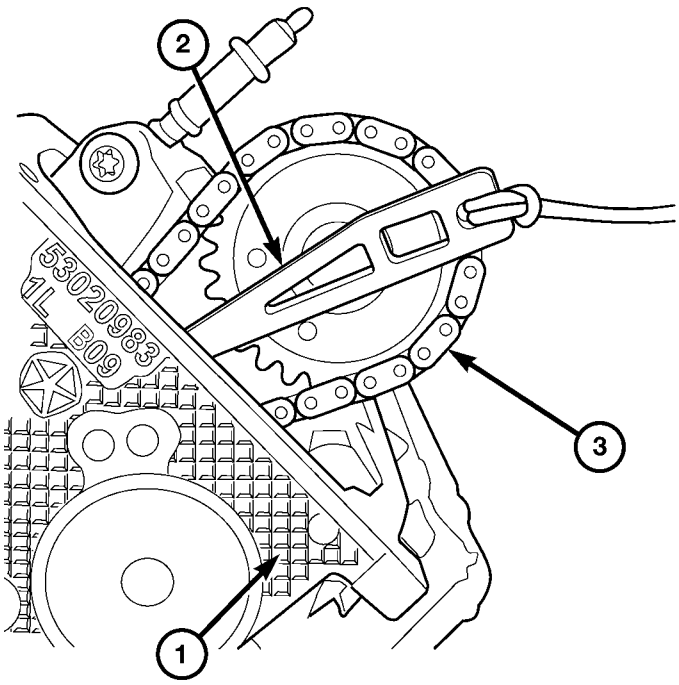

Fig. 98 SECURING TIMING CHAIN TENSIONER USING TIMING CHAIN WEDGE

1 - CYLINDER HEAD
2 -SPECIAL TOOL 8379
3 - TIMING CHAIN

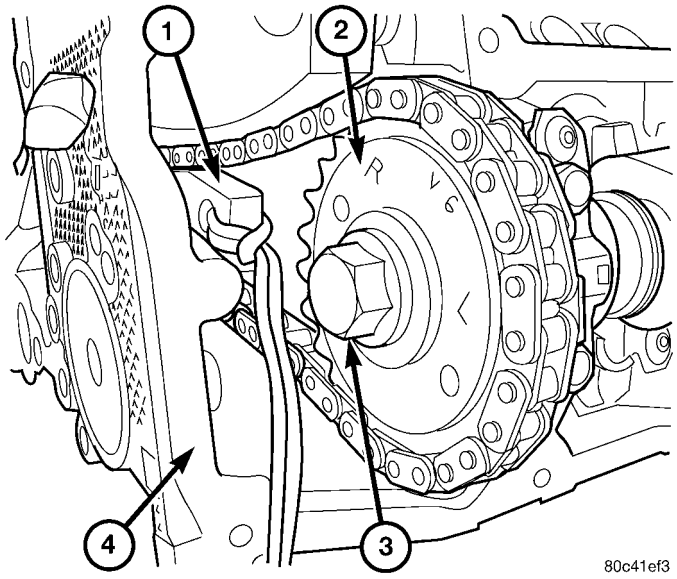

Fig. 99 CAMSHAFT DRIVE GEAR REMOVAL/ INSTALLATION

1 - SPECIAL TOOL 8379 TIMING CHAIN WEDGE
2 - CAMSHAFT DRIVE GEAR
3 - RETAINING BOLT
4 - CYLINDER HEAD

(6) Position the camshaft drive gear onto the camshaft, remove oil from bolt then install the retaining bolt. Using Special Tools, Spanner Wrench 6958 with Adapter Pins 8346 and a suitable torque wrench, Tighten retaining bolt to 122 N·m (90 ft. Lbs.).

(7) Remove Special Tool 8379.

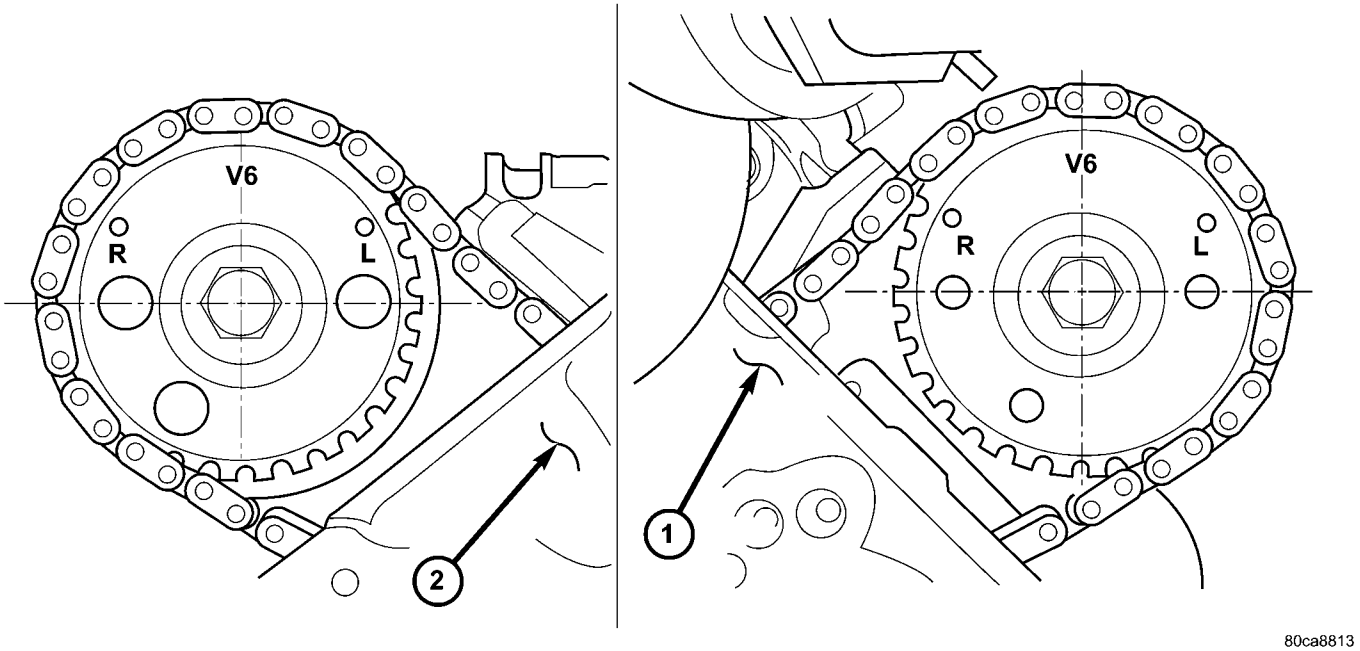

Fig. 100 CAMSHAFT SPROCKET V6 MARKS (#1 TDC, Exhaust stroke)

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

VALVE TIMING (Continued)

(8) Rotate the crankshaft two full revolutions, then verify that the camshaft drive gear V6 marks are in fact aligned.

(9) Install the cylinder head covers. Refer to Cylinder Head Cover in this section.

BALANCE SHAFT

REMOVAL

(1) Remove the primary and secondary timing chains. Refer to TIMING CHAIN and SPROCKET.

NOTE: The balance shaft and gear are serviced as an assembly. Do not attempt to remove the gear from the balance shaft.Remove the retaining bolt from the counterbalance shaft thrust plate (Fig. 101).

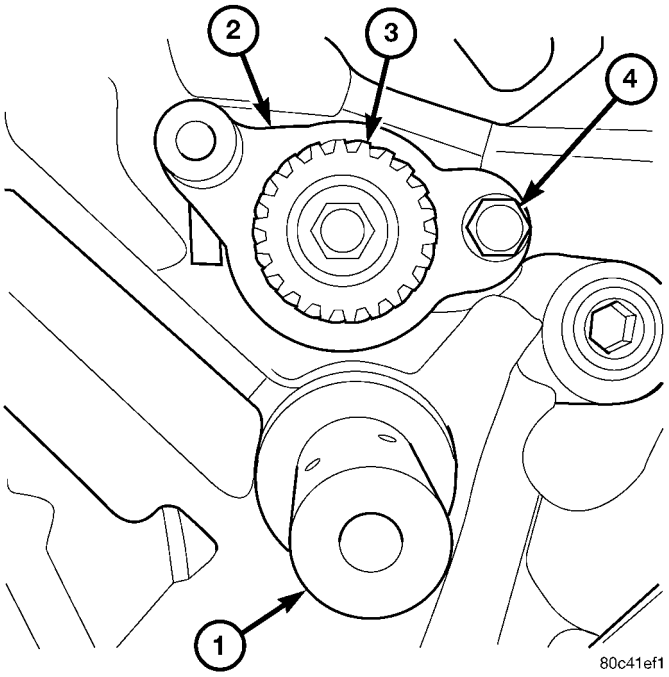

Fig. 101 Counterbalance Shaft Retaining Plate

1 - IDLER SHAFT
2 - COUNTERBALANCE SHAFT THRUST PLATE
3 - COUNTERBALANCE SHAFT DRIVE GEAR
4 - RETAINING BOLT

(2) Using Special Tool 8641 Counterbalance shaft remover/installer tool, remove the counterbalance shaft from the engine (Fig. 102).

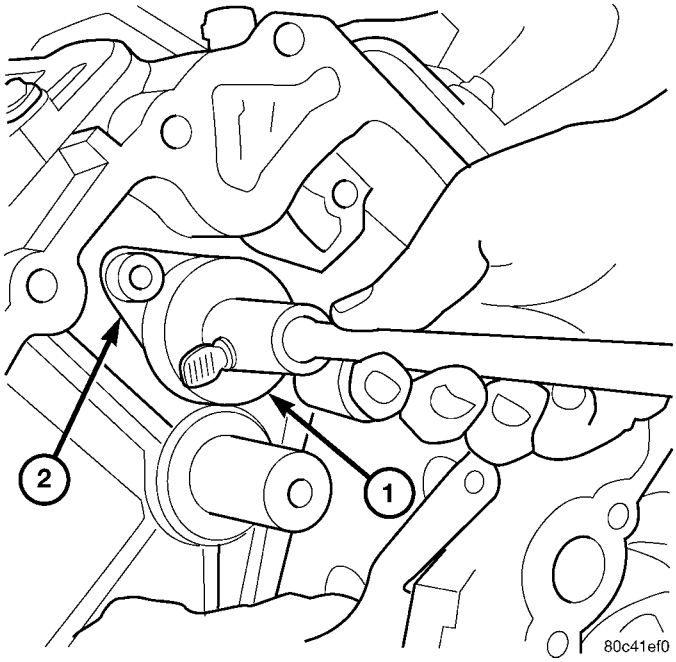

Fig. 102 Counterbalance Shaft Removal/Installation Tool

1 - COUNTERBALANCE SHAFT REMOVAL AND INSTALLATION TOOL
2 - COUNTERBALANCE SHAFT THRUST PLATE

INSTALLATION

NOTE: The balance shaft and gear are serviced as an assembly. Do not attempt to remove the gear from the balance shaft.

(1) Coat counterbalance shaft bearing journals with clean engine oil.

NOTE: The balance shaft is heavy, and care should be used when installing shaft, so bearings are not damaged.

(2) Using Special Tool 8641 Counterbalance shaft remover/installer tool, carefully install counterbalance shaft into engine.

(3) Install Counterbalance shaft thrust plate retaining bolt finger tight.Do not tighten bolt at this time.

(4) Position the right side of the thrust plate with the right chain guide bolt, install bolt finger tight.

(5) Torque the thrust plate retaining bolt to 28 N·m (250 in. lbs.).

(6) Remove the chain guide bolt so that guide can be installed.

IDLER SHAFT

REMOVAL

(1) Remove the primary and secondary timing chains and sprockets. Refer to procedure in this section.

NOTE: To remove the idler shaft, it is necessary to tap threads into the shaft, to install the removal tool.

(2) Using a 12 mm X 1.75 tap, cut threads in the idler shaft center bore.
(3) Cover the radiator core with a suitable cover.

CAUTION: Use care when removing the idler shaft, Do not strike the radiator cooling fins with the slide hammer.

(4) Using Special Tool 8517 Slide Hammer, remove the idler shaft.

INSTALLATION

(1) Thoroughly clean the idler shaft bore.
(2) Position the idler shaft in the bore.

NOTE: The two lubrication holes in the idler shaft do not require any special alignment.

NOTE: Before using the retaining bolt to install the idler shaft, coat the threads and the pilot on the idler shaft, with clean engine oil.

(3) Using the primary idler sprocket retaining bolt and washer, carefully draw the idler shaft into the bore until fully seated.
(4) Coat the idler shaft with clean engine oil.
(5) Install the timing chains and sprockets. Refer to procedure in this section.

TIMING BELT / CHAIN COVER(S)

REMOVAL

(1) Disconnect the battery negative cable.
(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(3) Remove electric cooling fan and fan shroud assembly.
(4) Remove fan and fan drive assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(5) Disconnect both heater hoses at timing cover.
(6) Disconnect lower radiator hose at engine.
(7) Remove accessory drive belt tensioner assembly (Fig. 103).

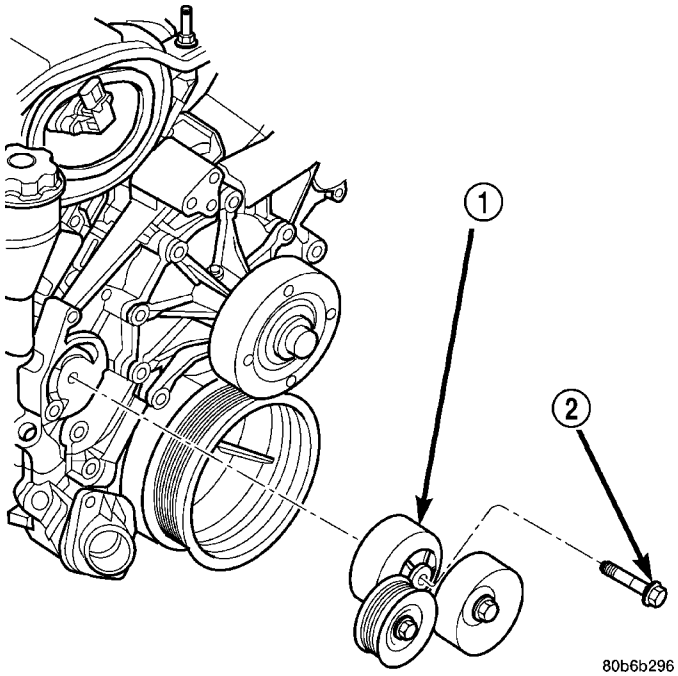

Fig. 103 ACCESSORY DRIVE BELT TENSIONER

1 - TENSIONER ASSEMBLY
2 - FASTENER TENSIONER TO FRONT COVER

(8) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(9) Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
(10) Remove A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

CAUTION: The 3.7L engine uses an anerobic sealer instead of a gasket to seal the front cover to the engine block, from the factory. For service, Mopar® Engine RTV sealant must be substituted.

NOTE: It is not necessary to remove the water pump for timing cover removal.

(11) Remove the bolts holding the timing cover to engine block (Fig. 104).
(12) Remove the timing cover.

INSTALLATION

CAUTION: Do not use oil based liquids to clean timing cover or block surfaces. Use only rubbing alcohol, along with plastic or wooden scrapers. Use no wire brushes or abrasive wheels or metal scrapers, or damage to surfaces could result.

TIMING BELT / CHAIN COVER(S) (Continued)

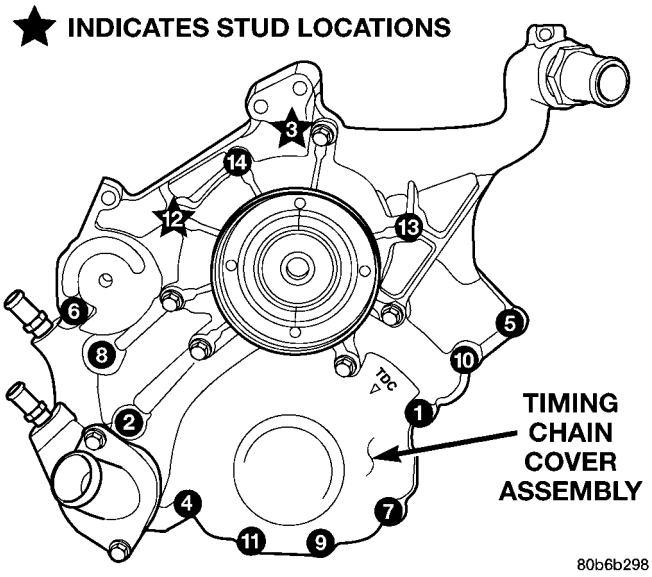

Fig. 104 TIMING CHAIN COVER FASTENERS

(1) Clean timing chain cover and block surface using rubbing alcohol.

CAUTION: The 3.7L uses a special anerobic sealer instead of a gasket to seal the timing cover to the engine block, from the factory. For service repairs, Mopar® Engine RTV must be used as a substitute.

(2) Inspect the water passage o-rings for any damage, and replace as necessary.

(3) Apply Mopar® Engine RTV sealer to front cover following the path below using a 3 to 4mm thick bead (Fig. 105).

(4) Install cover. Tighten fasteners in sequence as shown in to 58 N·m (43 ft. lbs.) (Fig. 106).

(5) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(6) Install the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(7) Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(8) Install accessory drive belt tensioner assembly (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION).

(9) Install radiator upper and lower hoses.

(10) Install both heater hoses.

(11) Install electric fan shroud and viscous fan drive assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(12) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(13) Connect the battery negative cable.

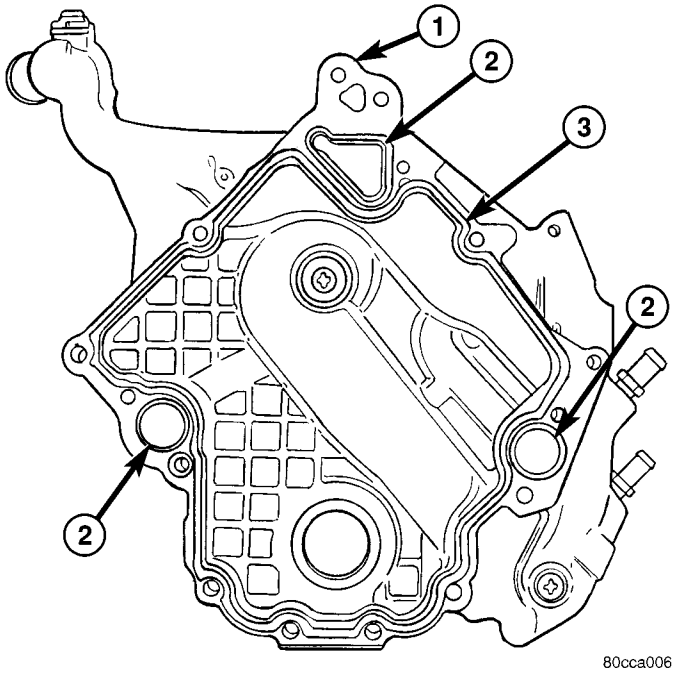

Fig. 105 TIMING COVER SEALANT

1 - TIMING CHAIN COVER
2 - WATER PASSAGE ORING
3 - MOPAR® ENGINE RTV SEALER

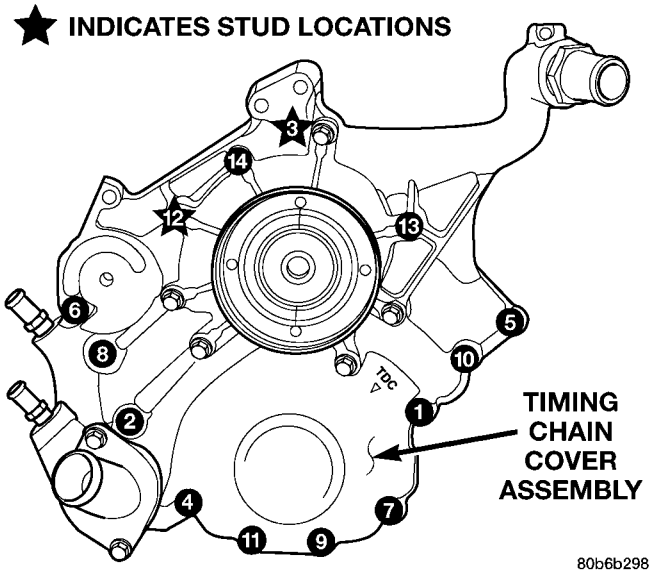

Fig. 106 TIMING CHAIN COVER FASTENERS

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

(1) Disconnect negative cable from battery.

(2) Drain cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove right and left cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(4) Remove radiator fan shroud(Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(5) Rotate engine until timing mark on crankshaft damper aligns with TDC mark on timing chain cover (Fig. 108) and the camshaft sprocket “V6” marks are at the 12 o'clock position (No. 1 TDC exhaust stroke) (Fig. 107).

(6) Remove power steering pump(Refer to 19 - STEERING/PUMP - REMOVAL).

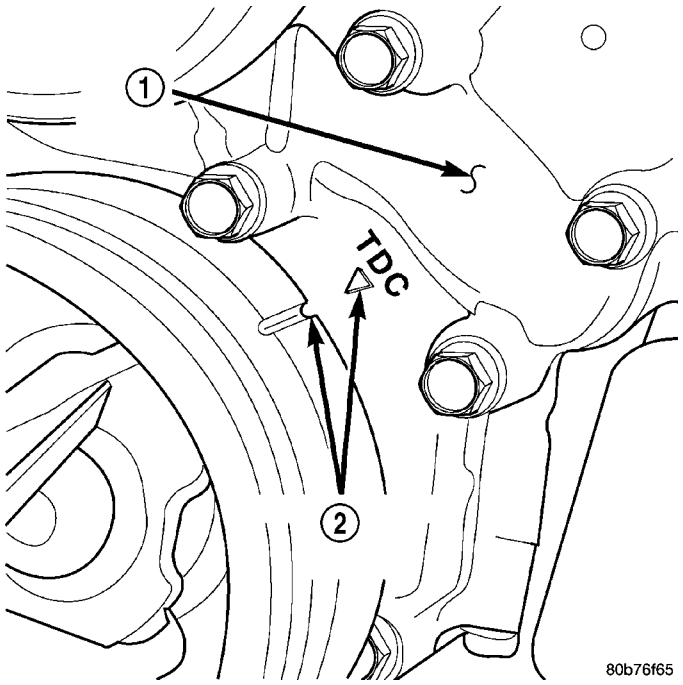

Fig. 108 Engine Top Dead Center

1 - TIMING CHAIN COVER
2 - CRANKSHAFT TIMING MARKS

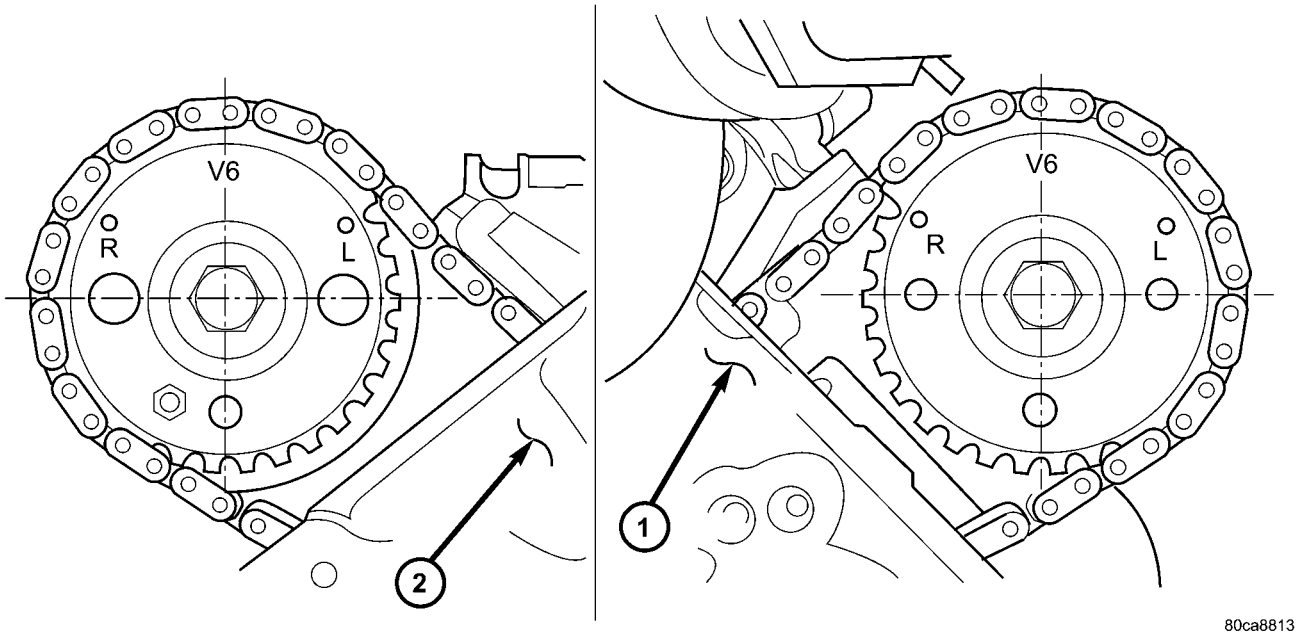

Fig. 107 CAMSHAFT SPROCKET V6 MARKS, (#1 TDC EXHAUST STROKE)

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(7) Remove access plug from left and right cylinder heads for access to chain guide fasteners (Fig. 109).

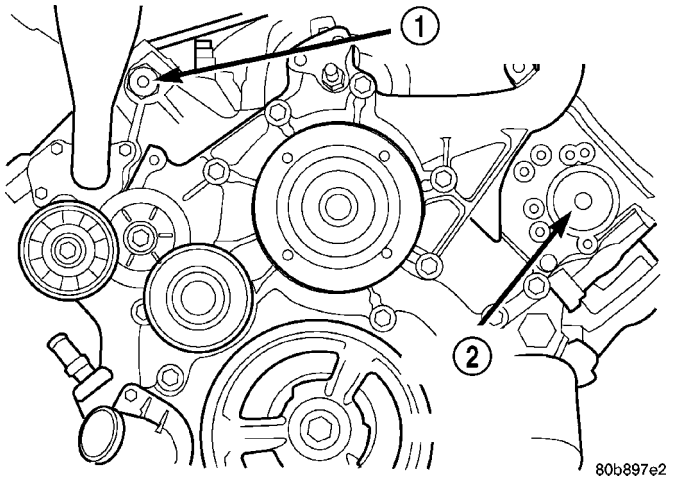

Fig. 109 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

(8) Remove the oil fill housing to gain access to the right side tensioner arm fastener.

(9) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(10) Collapse and pin primary chain tensioner.

CAUTION: Plate behind left secondary chain tensioner could fall into oil pan. Therefore, cover pan opening.

(11) Remove secondary chain tensioners.

(12) Remove camshaft position sensor (Fig. 110).

CAUTION: Care should be taken not to damage camshaft target wheel. Do not hold target wheel while loosening or tightening camshaft sprocket. Do not place the target wheel near a magnetic source of any kind. A damaged or magnetized target wheel could cause a vehicle no start condition.

CAUTION: Do not forcefully rotate the camshafts or crankshaft independently of each other. Damaging intake valve to piston contact will occur. Ensure negative battery cable is disconnected to guard against accidental starter engagement.

(13) Remove left and right camshaft sprocket bolts.

(14) While holding the left camshaft steel tube with Special Tool 8428 Camshaft Wrench, remove the left camshaft sprocket. Slowly rotate the camshaft approximately 5 degrees clockwise to a neutral position.

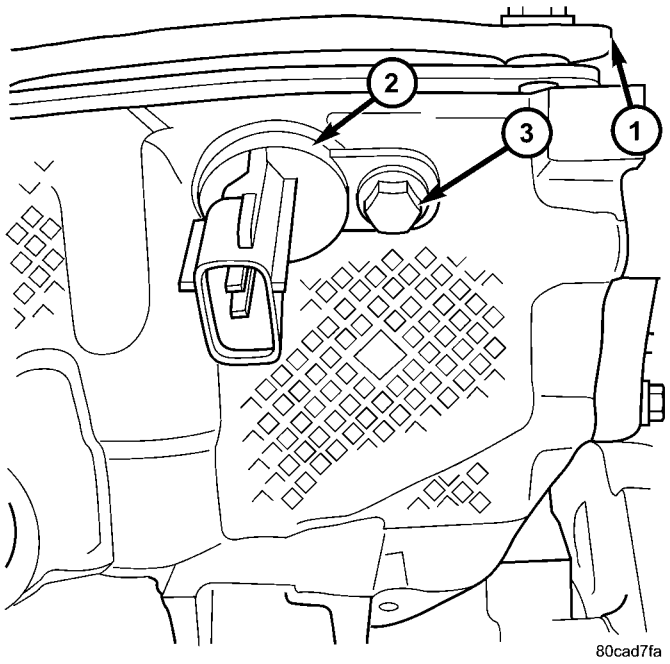

Fig. 110 Camshaft Position Sensor

1 - CYLINDER HEAD
2 - CAMSAHFT POSITION SENSOR
3 - SCREW

(15) While holding the right camshaft steel tube with Special Tool 8428 Camshaft Wrench, remove the right camshaft sprocket.

(16) Remove idler sprocket assembly bolt.

(17) Slide the idler sprocket assembly and crank sprocket forward simultaneously to remove the primary and secondary chains.

(18) Remove both pivoting tensioner arms and chain guides.

(19) Remove primary chain tensioner.

INSPECTION

Inspect the following components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Idler sprocket assembly spline joint. The joint should be tight with no backlash or axial movement.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep. If plastic face is severely grooved or melted, the tensioner lube jet may be clogged. The tensioner should be replaced.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner tensioner arm and chain should be replaced.

TIMING BELT/CHAIN AND SPROCKETS (Continued)

- Primary chain tensioner plastic faces. Replace as required.

INSTALLATION

(1) Using a vise, lightly compress the secondary chain tensioner piston until the piston step is flush with the tensioner body. Using a pin or suitable tool, release ratchet pawl by pulling pawl back against spring force through access hole on side of tensioner. While continuing to hold pawl back, Push ratchet device to approximately 2 mm from the tensioner body. Install Special Tool 8514 lock pin into hole on front of tensioner (Fig. 111). Slowly open vise to transfer piston spring force to lock pin.

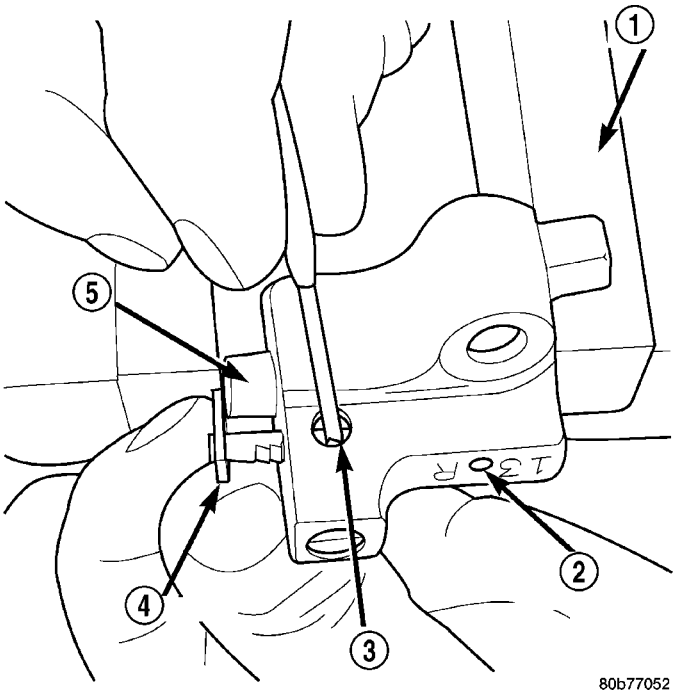

Fig. 111 RESETTING SECONDARY CHAIN TENSIONERS

1 - VISE
2 - INSERT LOCK PIN
3 - RATCHET PAWL
4 - RATCHET
5 - PISTON

(2) Position primary chain tensioner over oil pump and insert bolts into lower two holes on tensioner bracket. Tighten bolts to 28 N·m (250 in. lbs.).

(3) Install right side chain tensioner arm. Install Torx® bolt. Tighten Torx® bolt to 28 N·m (250 in. lbs.).

CAUTION: The silver bolts retain the guides to the cylinder heads and the black bolts retain the guides to the engine block.

(4) Install the left side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

(5) Install left side chain tensioner arm, and Torx® bolt. Tighten Torx® bolt to 28 N·m (250 in. lbs.).

(6) Install the right side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

(7) Install both secondary chains onto the idler sprocket. Align two plated links on the secondary chains to be visible through the two lower openings on the idler sprocket (4 o'clock and 8 o'clock). Once the secondary timing chains are installed, position special tool 8429 to hold chains in place for installation.

(8) Align primary chain double plated links with the timing mark at 12 o'clock on the idler sprocket. Align the primary chain single plated link with the timing mark at 6 o'clock on the crankshaft sprocket.

(9) Lubricate idler shaft and bushings with clean engine oil.

NOTE: The idler sprocket must be timed to the counterbalance shaft drive gear before the idler sprocket is fully seated.

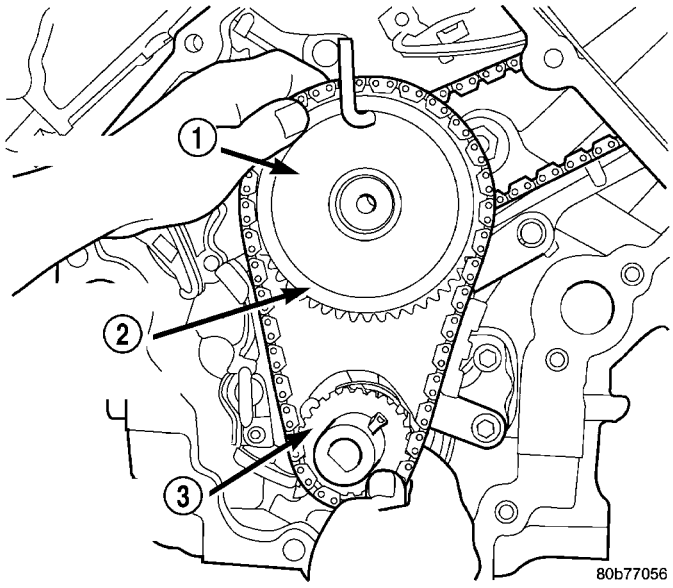

Fig. 112 INSTALLING IDLER GEAR, PRIMARY AND SECONDARY TIMING CHAINS

1 - SPECIAL TOOL 8515
2 - PRIMARY CHAIN IDLER SPROCKET
3 - CRANKSHAFT SPROCKET

(10) Install all chains, crankshaft sprocket, and idler sprocket as an assembly (Fig. 112). After guiding both secondary chains through the block and cylinder head openings, affix chains with a elastic strap or equivalent. This will maintain tension on chains to aid in installation. Align the timing mark on the idler sprocket gear to the timing mark on the counterbalance shaft drive gear, then seat idler sprocket fully (Fig. 113). Before installing idler sprocket bolt, lubricate washer with oil, and tighten idler sprocket assembly retaining bolt to 34 N·m (25 ft. lbs.).

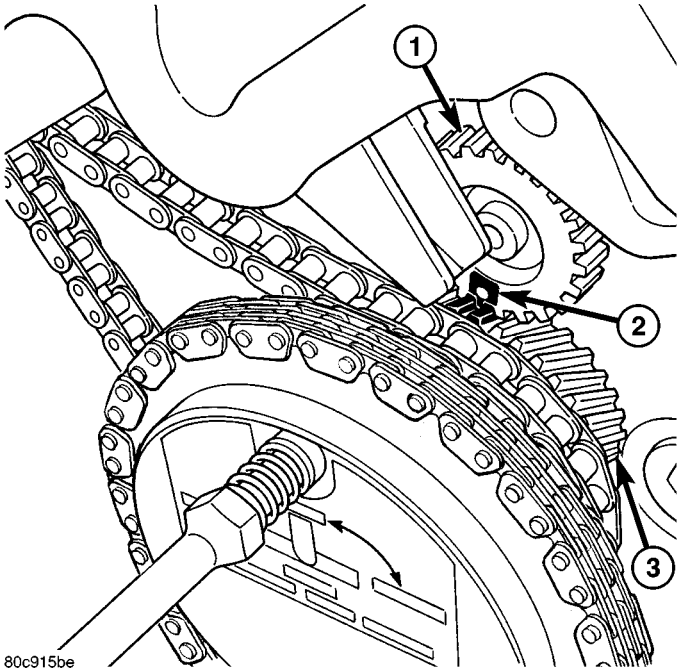

Fig. 113 COUNTERBALANCE SHAFT ALIGNMENT MARKS

1 - COUNTERBALANCE SHAFT GEAR
2 - TIMING MARK
3 - IDLER SPROCKET GEAR

NOTE: It will be necessary to slightly rotate camshafts for sprocket installation.

(11) Align left camshaft sprocket "L" dot to plated link on chain.

(12) Align right camshaft sprocket "R" dot to plated link on chain.

CAUTION: Remove excess oil from the camshaft sprocket bolt. Failure to do so can result in overtorque of bolt resulting in bolt failure.

(13) Remove Special Tool 8429, then attach both sprockets to camshafts. Remove excess oil from bolts, then Install sprocket bolts, but do not tighten at this time.

(14) Verify that all plated links are aligned with the marks on all sprockets and the "V6" marks on camshaft sprockets are at the 12 o'clock position.

CAUTION: Ensure the plate between the left secondary chain tensioner and block is correctly installed.

(15) Install both secondary chain tensioners. Tighten bolts to 28 N·m (250 in. lbs.).

NOTE: Left and right secondary chain tensioners are not common.

(16) Remove all locking pins (3) from tensioners.

CAUTION: After pulling locking pins out of each tensioner, DO NOT manually extend the tensioner(s) ratchet. Doing so will over tension the chains, resulting in noise and/or high timing chain loads.

(17) Using Special Tool 6958, Spanner with Adaptor Pins 8346, tighten left (Fig. 114) and right (Fig. 115). camshaft sprocket bolts to 122 N·m (90 ft. lbs.).

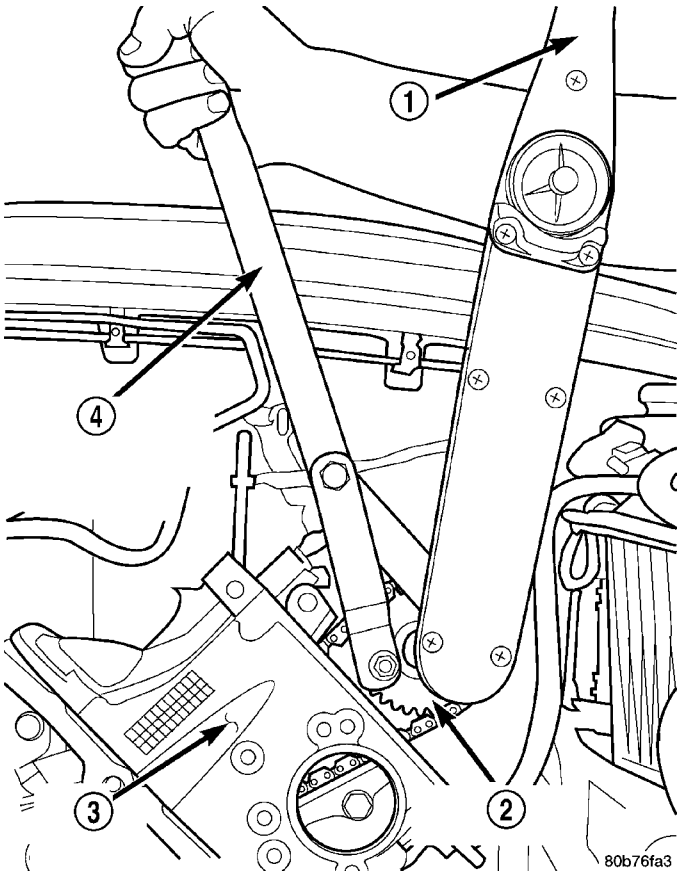

Fig. 114 TIGHTENING LEFT SIDE CAMSHAFT SPROCKET BOLT

1 - TORQUE WRENCH
2 - CAMSHAFT SPROCKET
3 - LEFT CYLINDER HEAD
4 - SPECIAL TOOL 6958 SPANNER WITH ADAPTER PINS 8346

(18) Rotate engine two full revolutions. Verify timing marks are at the follow locations:

- primary chain idler sprocket dot is at 12 o'clock
- primary chain crankshaft sprocket dot is at 6 o'clock
- secondary chain camshaft sprockets "V6" marks are at 12 o'clock
- counterbalancer shaft drive gear dot is aligned to the idler sprocket gear dot

(19) Lubricate all three chains with engine oil.

(20) After installing all chains, it is recommended that the idler gear end play be checked. The end play

1 - IDLER SPROCKET ASSEMBLY
2 - DIAL INDICATOR

must be within 0.10 -0.25 mm (0.004 - 0.010 in.). If not within specification, the idler gear must be replaced (Fig. 116).

(21) Install timing chain cover and crankshaft damper. Refer to procedures.

(22) Install cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

NOTE: Before installing threaded plug in right cylinder head, the plug must be coated with sealant to prevent leaks.

(23) Coat the large threaded access plug with **Mopar® Thread Sealant with Teflon**, then install into the right cylinder head and tighten to 81 N·m (60 ft. lbs.).

(24) Install the oil fill housing.

(25) Install access plug in left cylinder head.

(26) Install power steering pump(Refer to 19 - STEERING/PUMP - INSTALLATION).

(27) Fill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(28) Connect negative cable to battery.

ENGINE - 4.7L

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery	1. Charge or replace as necessary.
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals.
	3. Faulty starter.	3. (Refer to 8 - ELECTRICAL/ STARTING - DIAGNOSIS AND TESTING).
	4. Faulty coil or control unit.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	5. Incorrect spark plug gap.	5. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	6. Dirt or water in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump, relay or wiring.	7. Repair or replace as necessary.
ENGINE STALLS OR ROUGH IDLE	1. Idle speed set to low.	1. (Refer to 14 - FUEL SYSTEM/ FUEL INJECTION/IDLE AIR CONTROL MOTOR - REMOVAL).
	2. Idle mixture too lean or too rich.	2. Refer to Powertrain Diagnosis Information.
	3. Vacuum leak.	3. Inspect intake manifold and vacuum hoses, repair or replace as necessary.
	4. Faulty coil.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	5. Incorrect engine timing.	5. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

ENGINE - 4.7L (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
1. ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Dirt or water in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL PUMP - DIAGNOSIS AND TESTING).
	4. Blown cylinder head gasket.	4. Replace cylinder head gasket.
	5. Low compression.	5. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
	6. Burned, warped or pitted valves.	6. Replace as necessary.
	7. Plugged or restricted exhaust system.	7. Inspect and replace as necessary.
	8. Faulty coil.	8. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
1. ENGINE MISSES ON ACCELERATION	1. Spark plugs dirty or incorrectly gapped.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Dirt in fuel system.	2. Clean fuel system.
	3. Burned, warped or pitted valves.	3. Replcae as necessary.
	4. Faulty coil.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
1. ENGINE MISSES AT HIGH SPEED	1. Spark plugs dirty or incorrectly gapped.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Faulty coil.	2. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	3. Dirt or water in fuel system.	3. Clean system and replace fuel filter.

ENGINE - 4.7L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE)
	8. Excessive runout of valve seats on valve faces.	8. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE)
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of round.	6. Service or replace crankshaft.
	7. Loose flywheel or torque converter.	7. Tighten to correct torque

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs.

(3) Disable the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DESCRIPTION).

(4) Remove the ASD relay (Refer to 8 - ELECTRICAL/IGNITION CONTROL/AUTO SHUT DOWN RELAY - REMOVAL).

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

(7) (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner hose.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression,While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

DIAGNOSIS AND TESTING - ENGINE

DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) - PERFORMANCE and (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—MECHANICAL for possible causes and corrections of malfunctions. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING) and (Refer to 14 - FUEL SYSTEM/FUEL INJECTION - DIAGNOSIS AND TESTING) for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Engine Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING).
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING).

STANDARD PROCEDURE

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant

to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

REMOVAL

NOTE: This procedure applies to both the 4X2 and 4X4 vehicles, steps that apply to the 4X4 vehicle only, are identified.

(1) Disconnect the battery negative and positive cables.

(2) Remove the battery and the battery tray.

(3) Raise vehicle on hoist.

(4) Remove exhaust crossover pipe from exhaust manifolds.

(5) **4X4 vehicles** Disconnect axle vent tube from left side engine mount.

(6) Remove the through bolt retaining nut and bolt from both the left and right side engine mounts.

(7) **4X4 vehicles** Remove locknut from left and right side engine mount brackets.

(8) Disconnect two ground straps from the lower left hand side and one ground strap from the lower right hand side of the engine.

(9) Disconnect crankshaft position sensor. (Fig. 1)

NOTE: The following step applies to 4X4 vehicles equipped with automatic transmission only.

(10) **4X4 vehicles** Remove the axle isolator bracket from the engine, transmission and the axle.

(11) Remove structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).

(12) Remove starter (Refer to 8 - ELECTRICAL/ STARTING/STARTER MOTOR - REMOVAL).

(13) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

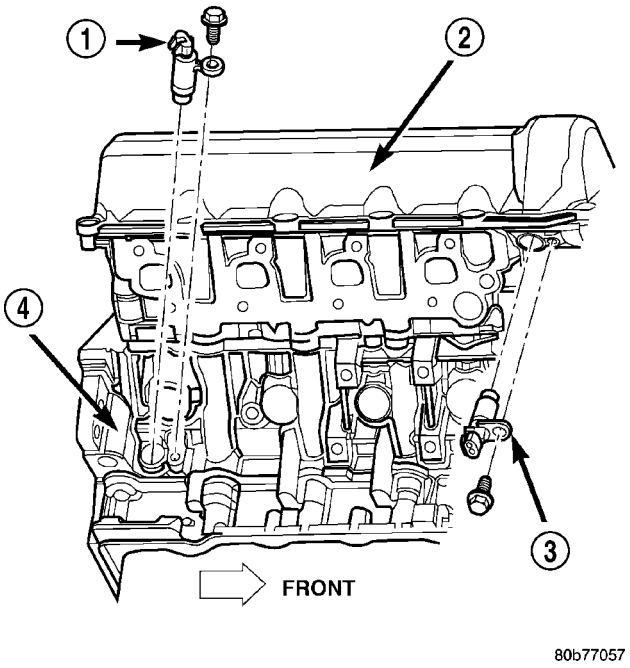

Fig. 1 Crankshaft Position Sensor

1 - CRANKSHAFT POSITION SENSOR
2 - CYLINDER HEAD COVER
3 - CAMSHAFT POSITION SENSOR
4 - RIGHT SIDE CYLINDER BLOCK

(14) Remove torque converter bolts (Automatic Transmission Only).

(15) Remove transmission to engine mounting bolts.

(16) Disconnect the engine block heater power cable from the block heater, if equipped.

(17) Lower vehicle.

(18) Remove throttle body resonator assembly and air inlet hose.

ENGINE - 4.7L (Continued)

(19) Disconnect throttle and speed control cables.

(20) Disconnect tube from both the left and right side crankcase breathers (Fig. 2). Remove breathers

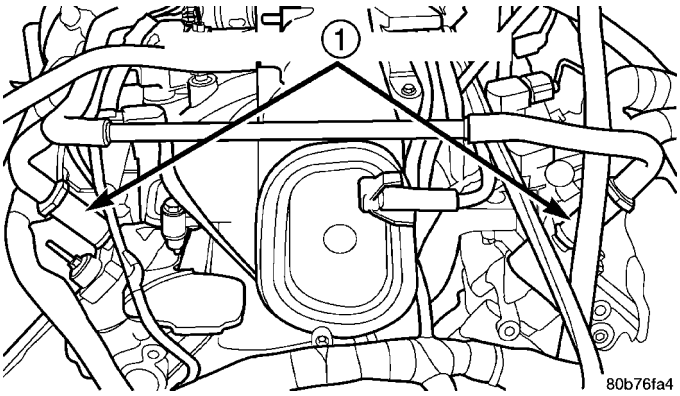

Fig. 2 Crankcase Breather Connection Points

1 - CRANKCASE BREATHERS

(21) Discharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE).

(22) Remove A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

(23) Remove shroud, fan assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL) and accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(24) Disconnect transmission oil cooler lines at the radiator.

(25) Disconnect radiator upper and lower hoses.

(26) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL), A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL) and transmission oil cooler.

(27) Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(28) Disconnect the two heater hoses from the timing chain cover and heater core.

(29) Unclip and remove heater hoses and tubes from the intake manifold.

(30) Disconnect engine harness at the following points :

- Intake air temperature (IAT) sensor (Fig. 3)
- Fuel Injectors
- Throttle Position (TPS) Switch
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold absolute pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

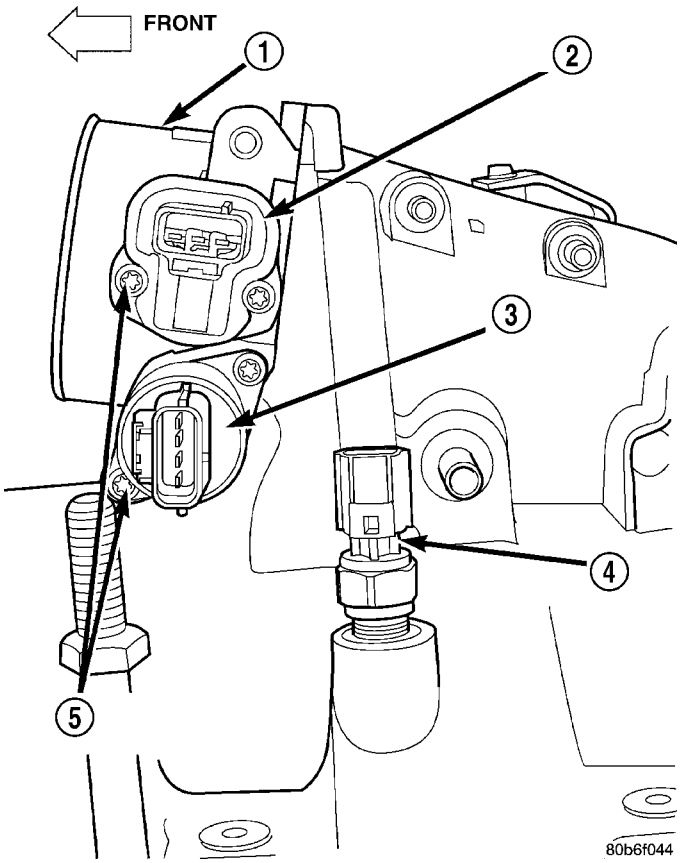

Fig. 3 Throttle Body Connection Points

1 - THROTTLE BODY
2 - TPS
3 - IAC MOTOR
4 - IAT SENSOR
5 - MOUNTING SCREWS

(31) Disconnect the vacuum lines at the throttle body and intake manifold.

(32) Release fuel rail pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE) then disconnect the fuel supply quick connect fitting at the fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(33) Remove power steering pump and position out of the way.

(34) Install Special Tools 8400 Lifting Studs, into the cylinder heads.

(35) Install Engine Lifting Fixture Special Tool 8347 (Fig. 4) following these steps.

- Holding the lifting fixture at a slight angle, slide the large bore in the front plate over the hex portion of the lifting stud.
- Position the two remaining fixture arms onto the two Special Tools 8400 Lifting Studs, in the cylinder heads.
- Pull foward and upward on the lifting fixture so that the lifting stud rest in the slotted area below the large bore.

ENGINE - 4.7L (Continued)

• Secure the lifting fixture to the three studs using three 7/16 – 14 N/C locknuts.
• Make sure the lifting loop in the lifting fixture is in the last hole (closest to the throttle body) to minimize the angle of engine during removal.

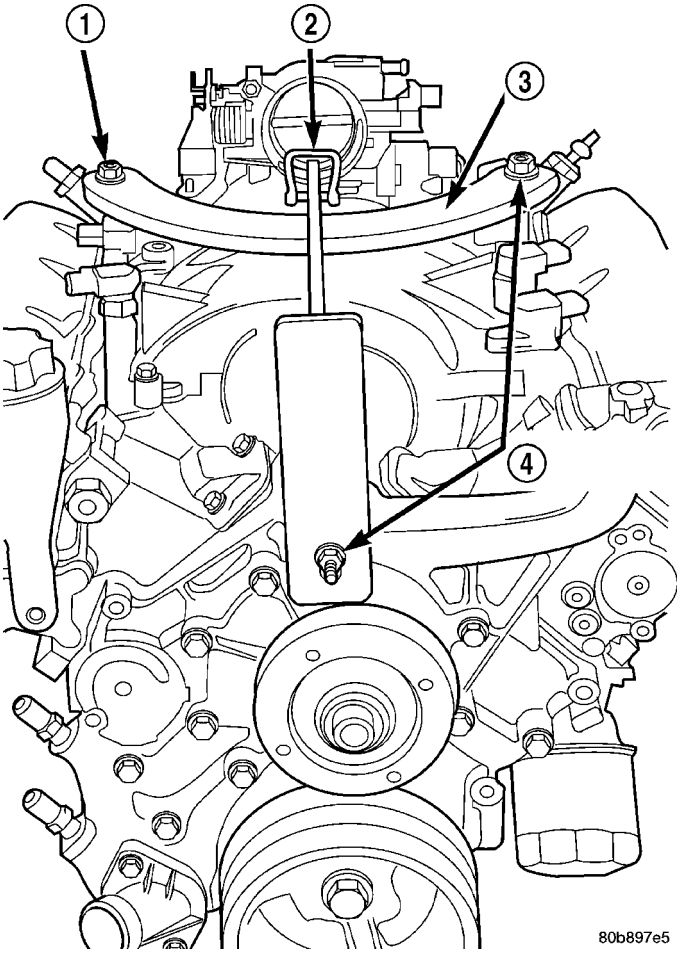

Fig. 4 Engine Lifting Fixture Attachment Locations

1 - ATTACHING LOCATION
2 - ADJUSTABLE HOOK
3 - SPECIAL TOOL 8347 ENGINE LIFT FIXTURE
4 - ATTACHING LOCATIONS

(36) Disconnect body ground strap at the right side cowl (Fig. 5).
(37) Disconnect body ground strap at the left side cowl (Fig. 6).

NOTE: It will be necessary to support the transmission in order to remove the engine.

(38) Position a suitable jack under the transmission.
(39) Remove engine from the vehicle.

INSTALLATION

(1) Position engine in the vehicle.

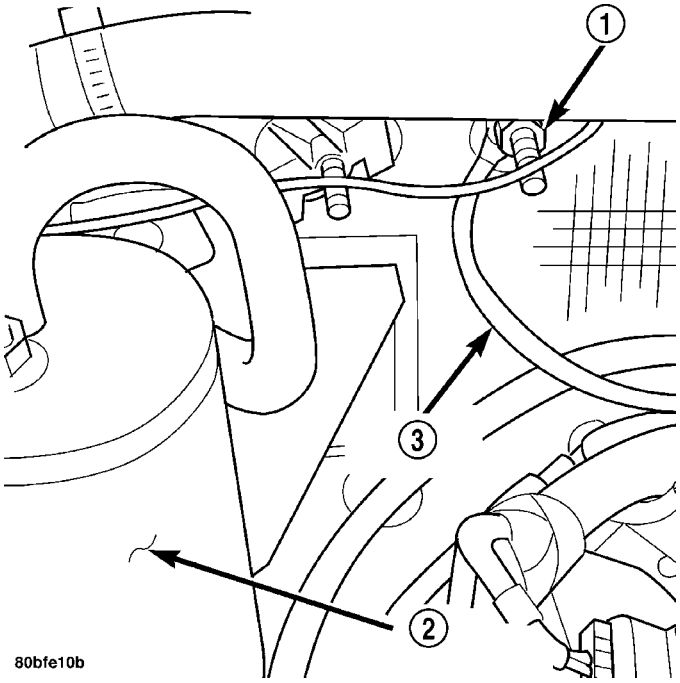

Fig. 5 Body Ground Strap—Right Side Removal / Installation

1 - NUT
2 - A/C ACCUMULATOR
3 - GROUND STRAP

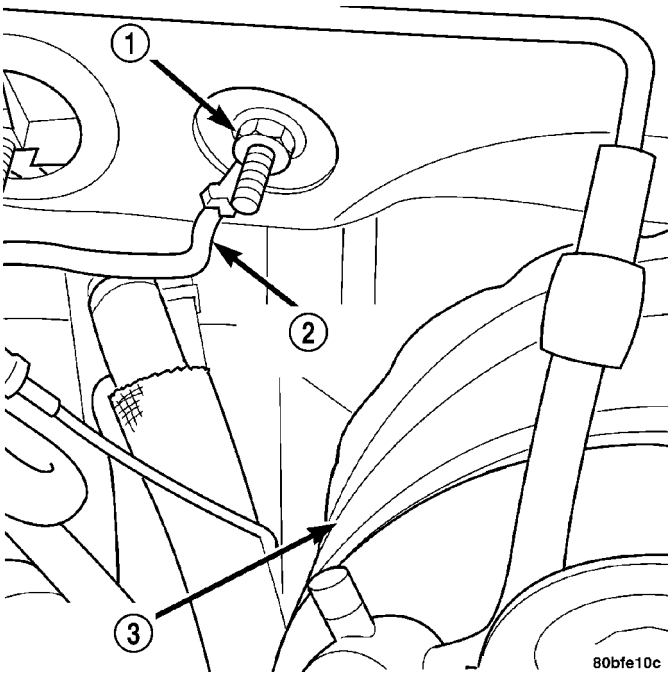

Fig. 6 Body Ground Strap—Left Side Removal / Installation

1 - NUT
2 - GROUND STRAP
3 - BRAKE BOOSTER

ENGINE - 4.7L (Continued)

Position both the left and right side engine mount brackets and install the through bolts and nuts. Tighten nuts to **4X2 vehicles** 95 N·m (70 ft. lbs.). **4X4 vehicles** 102 N·m (75 ft. lbs.).

(2) **4X4 vehicles** Install locknuts onto the engine mount brackets. Tighten locknuts to 41 N·m (30 ft. lbs.).

(3) Remove jack from under the transmission.

(4) Remove Engine Lifting Fixture Special Tool 8347 (Fig. 4).

(5) Remove Special Tools 8400 Lifting Studs.

(6) Position generator wiring behind the oil dipstick tube, then install the oil dipstick tube upper mounting bolt.

(7) Connect both left and right side body ground straps.

(8) Install power steering pump.

(9) Connect fuel supply line quick connect fitting (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/ QUICK CONNECT FITTING - STANDARD PROCEDURE).

(10) Connect the vacuum lines at the throttle body and intake manifold.

(11) Connect engine harness at the following points (Fig. 3):

- Intake Air Temperature (IAT) Sensor
- Idle Air Control (IAC) Motor
- Fuel Injectors
- Throttle Position (TPS) Switch
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

(12) Position and install heater hoses and tubes onto intake manifold.

(13) Install the heater hoses onto the heater core and the engine front cover.

(14) Install generator (Refer to 8 - ELECTRICAL/ CHARGING/GENERATOR - INSTALLATION).

(15) Install A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION), radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION) and transmission oil cooler.

(16) Connect radiator upper and lower hoses.

(17) Connect the transmission oil cooler lines to the radiator.

(18) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION), fan assembly and shroud (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(19) Install A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(20) Install both breathers. Connect tube to both crankcase breathers (Fig. 2).

(21) Connect throttle and speed control cables.

(22) Install throttle body resonator assembly and air inlet hose. Tighten clamps 4 N·m (35 in. lbs.).

(23) Raise vehicle.

(24) Install transmission to engine mounting bolts. Tighten the bolts to 41 N·m (30 ft. lbs.).

(25) Install torque converter bolts (Automatic Transmission Only).

(26) Connect crankshaft position sensor (Fig. 1).

(27) **4X4 vehicles** Position and install the axle isolator bracket onto the axle, transmission and engine block. Tighten bolts to specification (Refer to 9 - ENGINE - SPECIFICATIONS).

(28) Install starter (Refer to 8 - ELECTRICAL/ STARTING/STARTER MOTOR - INSTALLATION).

CAUTION: The structural cover requires a specific torque sequence. Failure to follow this sequence may cause severe damage to the cover.

(29) Install structural cover (Refer to 9 - ENGINE/ ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

(30) Install exhaust crossover pipe.

(31) Install engine block heater power cable, If equipped.

(32) **4X4 vehicles** Connect axle vent tube to left side engine mount.

(33) Lower vehicle.

(34) Check and fill engine oil.

(35) Recharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE).

(36) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(37) Install the battery tray and battery.

(38) Connect the battery positive and negative cables.

(39) Start the engine and check for leaks.

ENGINE - 4.7L (Continued)

SPECIFICATIONS

SPECIFICATIONS - 4.7L ENGINE

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION
Engine Type	90° SOHC V-8 16-Valve
Displacement	4.7 Liters / 4701 cc 287 (Cubic Inches)
Bore	93.0 mm (3.66 in.)
Stroke	86.5 mm (3.40 in.)
Compression Ratio	9.0:1
Horsepower	235 BHP @ 4800 RPM
Torque	295 LB-FT @ 3200 RPM
Lead Cylinder	#1 Left Bank
Firing Order	1-8-4-3-6-5-7-2

AIR CLEANER ELEMENT

REMOVAL

Filter Element Only

Housing removal is not necessary for element (filter) replacement.

(1) Loosen clamp (Fig. 7) and disconnect air duct at air cleaner cover.

(2) Pry over 4 spring clips (Fig. 7) from housing cover (spring clips retain cover to housing).

(3) Release housing cover from locating tabs on housing (Fig. 7) and remove cover.

(4) Remove air cleaner element (filter) from housing.

(5) Clean inside of housing before replacing element.

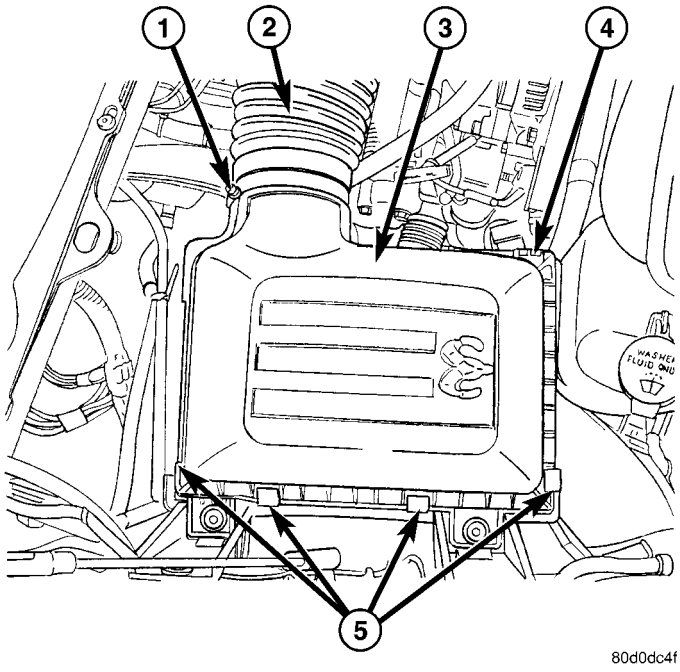

Fig. 7 AIR CLEANER HOUSING COVER

1 - CLAMP
2 - AIR DUCT
3 - AIR CLEANER COVER
4 - LOCATING TABS
5 - CLIPS (4)

Housing Assembly

(1) Loosen clamp (Fig. 7) and disconnect air duct at air cleaner cover.

(2) Lift entire housing assembly from 4 locating pins (Fig. 8).

INSTALLATION

(1) Install filter element into housing.

(2) Position housing cover into housing locating tabs (Fig. 7).

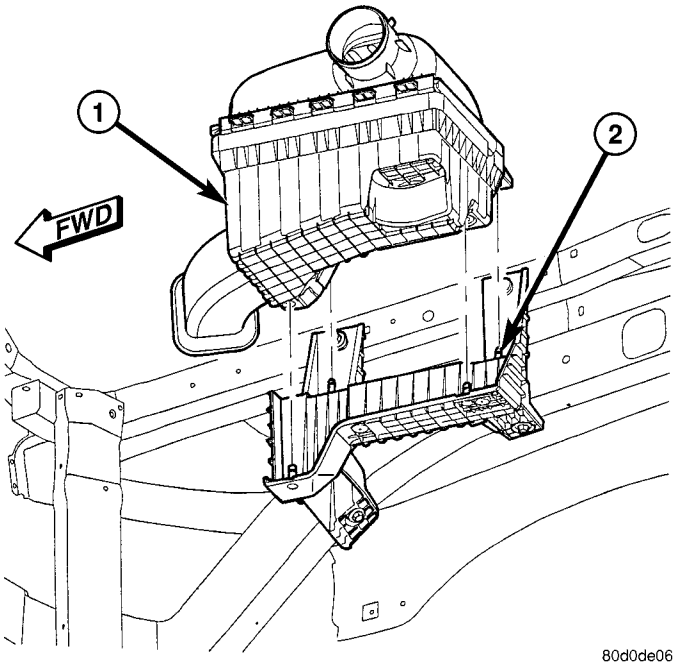

Fig. 8 AIR CLEANER HOUSING

1 - AIR CLEANER HOUSING ASSEMBLY
2 - LOCATING PINS (4)

(3) Pry up 4 spring clips (Fig. 7) and lock cover to housing.

(4) Install air duct to air cleaner cover and tighten hose clamp to 3 N·m (30 in. lbs.) torque.

(5) If any other hose clamps were removed from air intake system, tighten them to 3.4 N·m (30 in. lbs.) torque.

(6) If any bolts were removed from air resonator housing or air intake tubing, tighten them to 4.5 N·m (40 in. lbs.) torque.

CYLINDER HEAD

DESCRIPTION

DESCRIPTION - CYLINDER HEAD

The cylinder heads are made of an aluminum alloy. The cylinder head features two valves per cylinder with pressed in powdered metal valve guides. The cylinder heads also provide enclosures for the timing chain drain, necessitating unique left and right cylinder heads.

DESCRIPTION - VALVE GUIDES

The valve guides are made of powered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

CYLINDER HEAD (Continued)

REMOVAL

REMOVAL - LEFT CYLINDER HEAD

(1) Disconnect the negative cable from the battery.
(2) Raise the vehicle on a hoist.
(3) Disconnect the exhaust pipe at the left side exhaust manifold.
(4) Drain the engine coolant. Refer to COOLING SYSTEM.
(5) Lower the vehicle.
(6) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(7) Remove the master cylinder and booster assembly. Refer to section 5 brakes.
(8) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(9) Remove the fan shroud and fan blade assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(10) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(11) Remove the power steering pump and set aside.
(12) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 9).

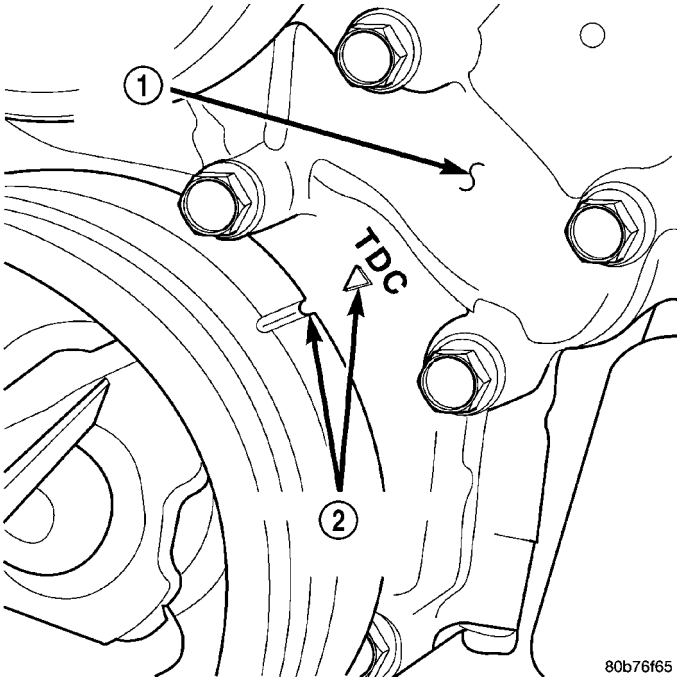

Fig. 9 Engine Top Dead Center (TDC) Indicator Mark

1 - TIMING CHAIN COVER
2 - CRANKSHAFT TIMING MARKS

(13) Verify the V8 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 11). Rotate the crankshaft one turn if necessary.
(14) Remove the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(15) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(16) Lock the secondary timing chains to the idler sprocket using Special Tool 8515 (Fig. 10).

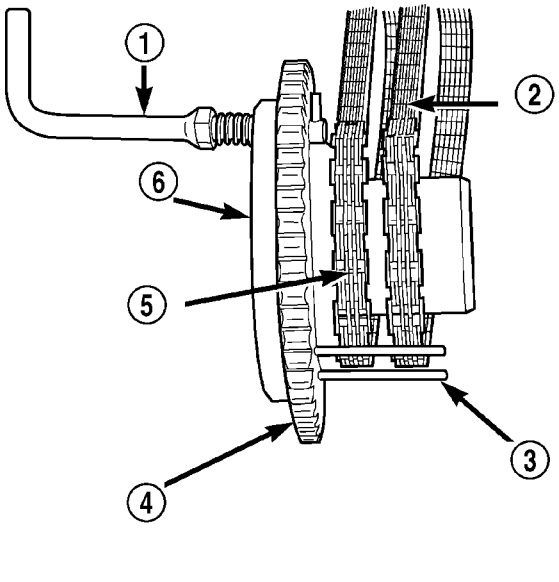

Fig. 10 Using Special Tool 8515 to Hold Chains to Idler Sprocket.

CYLINDER HEAD (Continued)

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

(17) Mark the secondary timing chain, one link on each side of the V8 mark on the camshaft drive gear (Fig. 11).

(20) Remove the left side secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(21) Remove the retaining bolt and the camshaft drive gear.

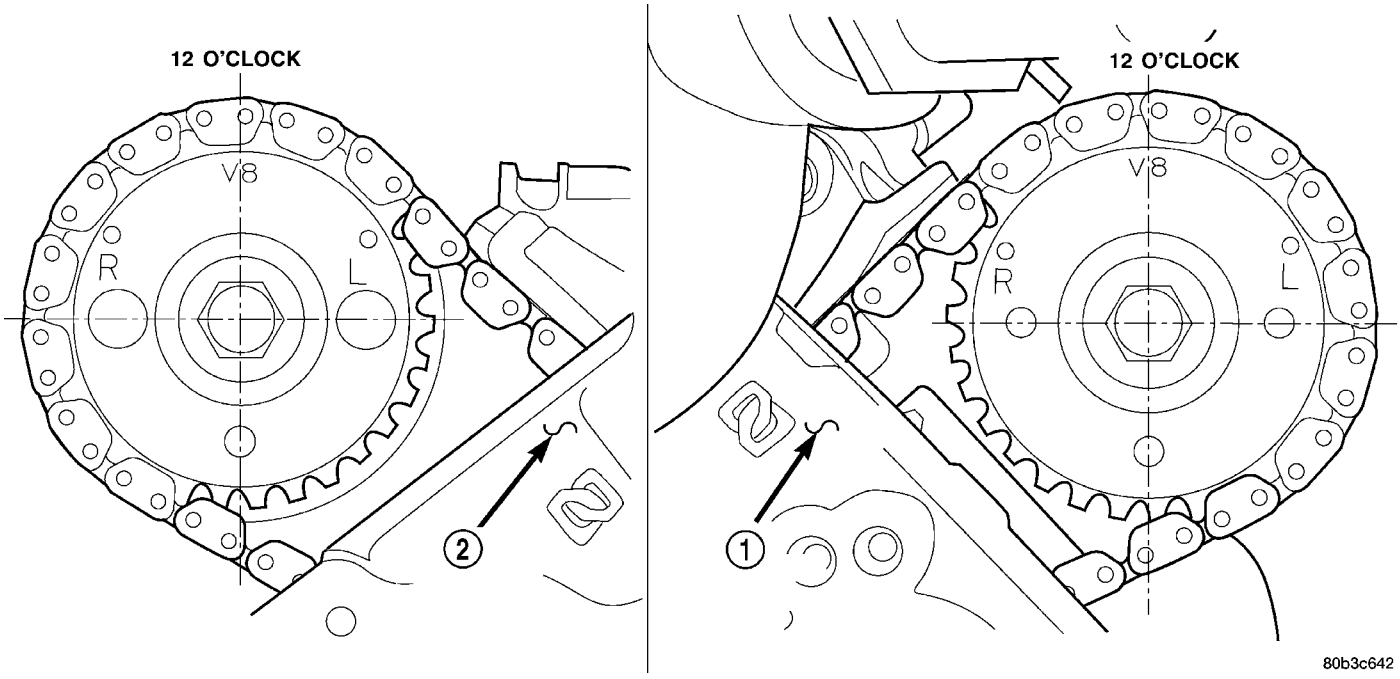

Fig. 11 Camshaft Sprocket V8 Marks

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

(18) Remove the left side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(19) Remove the cylinder head access plug (Fig. 12).

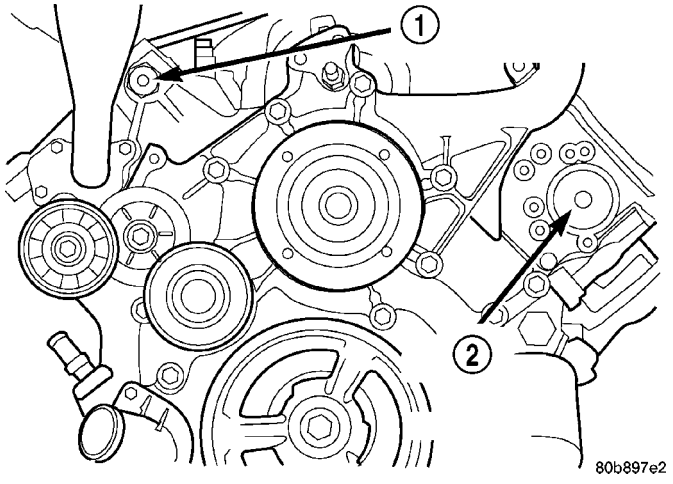

Fig. 12 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

CAUTION: Do not allow the engine to rotate. Severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

NOTE: The cylinder head is attached to the cylinder block with fourteen bolts.

(22) Remove the cylinder head retaining bolts.

(23) Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

CYLINDER HEAD (Continued)

REMOVAL - RIGHT CYLINDER HEAD

(1) Disconnect battery negitive cable.
(2) Raise the vehicle on a hoist.
(3) Disconnect the exhaust pipe at the right side exhaust manifold.
(4) Drain the engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
(5) Lower the vehicle.
(6) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(7) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(8) Remove the fan shroud (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(9) Remove oil fill housing from cylinder head.
(10) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(11) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 13).
(12) Verify the V8 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 14). Rotate the crankshaft one turn if necessary.
(13) Remove the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

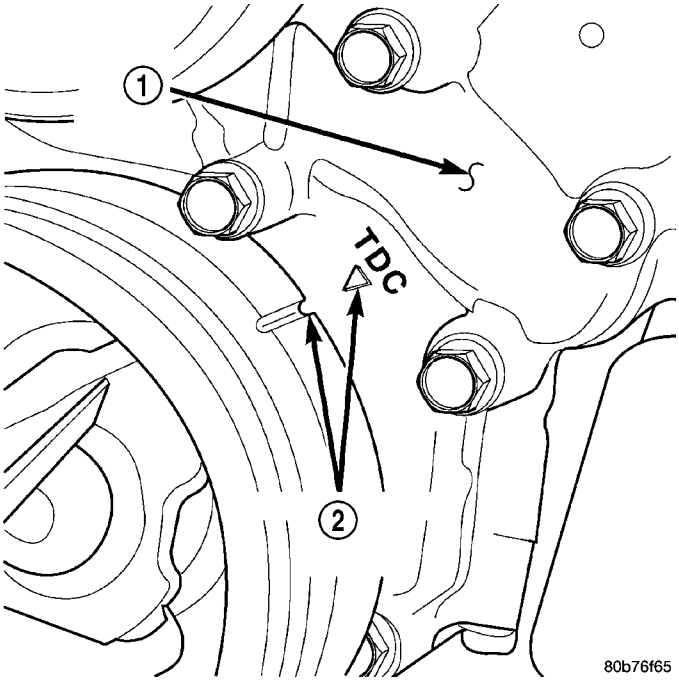

Fig. 13 Engine Top Dead Center (TDC) Indicator Mark

1 - TIMING CHAIN COVER

1 - LOCK ARM
2 - RIGHT CAMSHAFT CHAIN
3 - SECONDARY CHAINS RETAINING PINS (4)
4 - IDLER SPROCKET
5 - LEFT CAMSHAFT CHAIN
6 - SPECIAL TOOL 8515

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

(16) Mark the secondary timing chain, one link on each side of the V8 mark on the camshaft drive gear (Fig. 14).

(17) Remove the right side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(18) Remove the cylinder head access plug (Fig. 16).

(19) Remove the right side secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(20) Remove the retaining bolt and the camshaft drive gear.

CAUTION: Do not allow the engine to rotate. severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

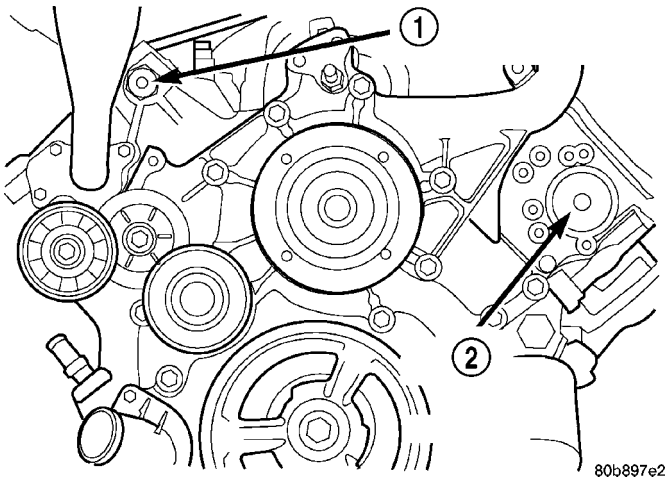

Fig. 16 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

CAUTION: Do not hold or pry on the camshaft target wheel for any reason. A damaged target wheel can result in a vehicle no start condition.

NOTE: The cylinder head is attached to the cylinder block with fourteen bolts.

(21) Remove the cylinder head retaining bolts.

(22) Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, do to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

INSPECTION

(1) Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.

(2) Inspect the valve seats for damage. Service the valve seats as necessary.

(3) Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.

CYLINDER HEAD (Continued)

INSTALLATION

INSTALLATION - LEFT CYLINDER HEAD

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 17).

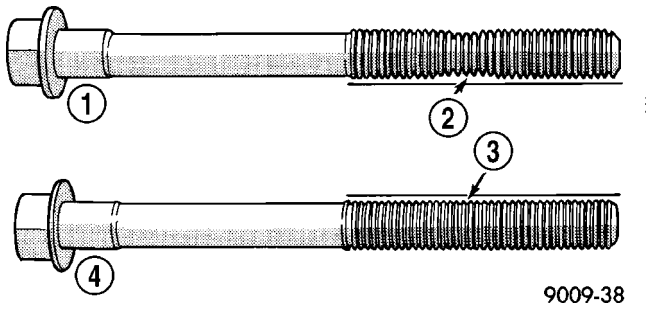

Fig. 17 Checking Cylinder Head Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Fig. 18).

(2) Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the ten M11 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar® Lock and Seal Adhesive** then install the bolts.

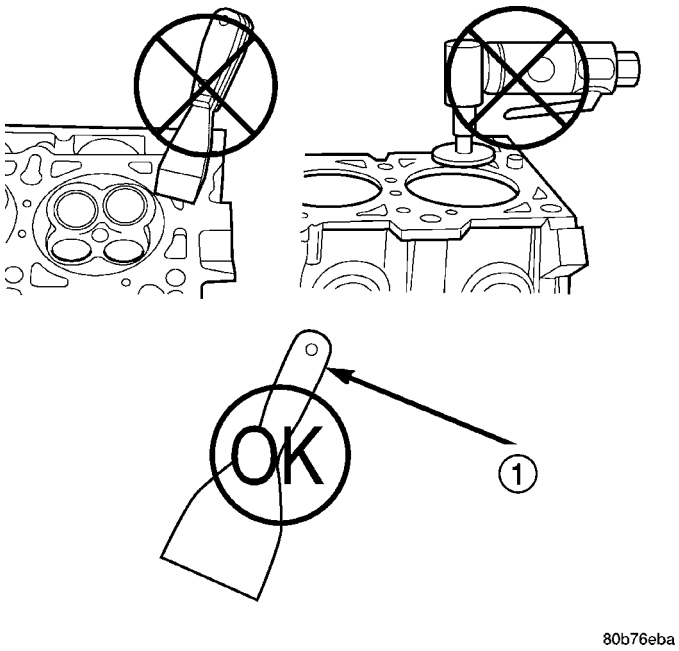

Fig. 18 Proper Tool Usage for

1 - PLASTIC/WOOD SCRAPER

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

(6) Tighten the bolts in sequence (Fig. 19) using the following steps and torque values:

- Step 1: Tighten bolts 1–10, 20 N·m (15 ft. lbs.).
- Step 2: Tighten bolts 1–10, 47 N·m (35 ft. lbs.). Tighten bolts 11–14, 25 N·m (18 ft. lbs.).
- Step 3: Tighten bolts 1–10, 90 degrees. Tighten bolts 11–14, 30 N·m (22 ft. lbs.).

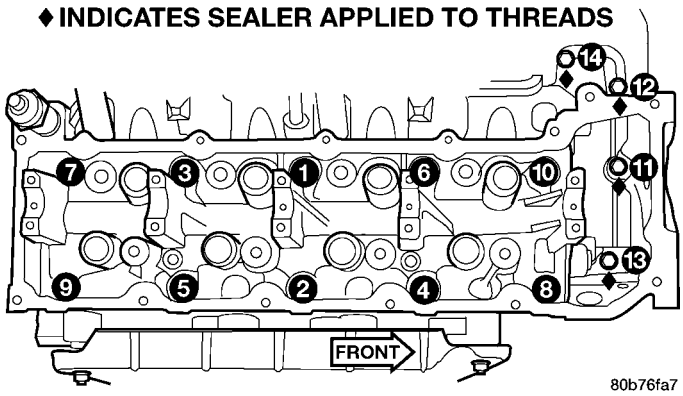

Fig. 19 Cylinder Head Tightening Sequence

(7) Position the secondary chain onto the camshaft drive gear, making sure one marked chain link is on either side of the V8 mark on the gear and position the gear onto the camshaft.

(8) Install the camshaft drive gear retaining bolt.

CYLINDER HEAD (Continued)

(9) Install the left side secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Install the cylinder head access plug (Fig. 20).

(11) Re-set and Install the left side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(12) Remove Special Tool 8515.

(13) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(14) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(15) Install the power steering pump.

(16) Install the fan blade assembly and fan shroud (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(17) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(18) Reinstall the master cylinder and booster assembly. Refer to section 5 brakes.

(19) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(20) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Raise the vehicle.

(22) Install the exhaust pipe onto the left exhaust manifold.

(23) Lower the vehicle.

(24) Connect the negative cable to the battery.

(25) Start the engine and check for leaks.

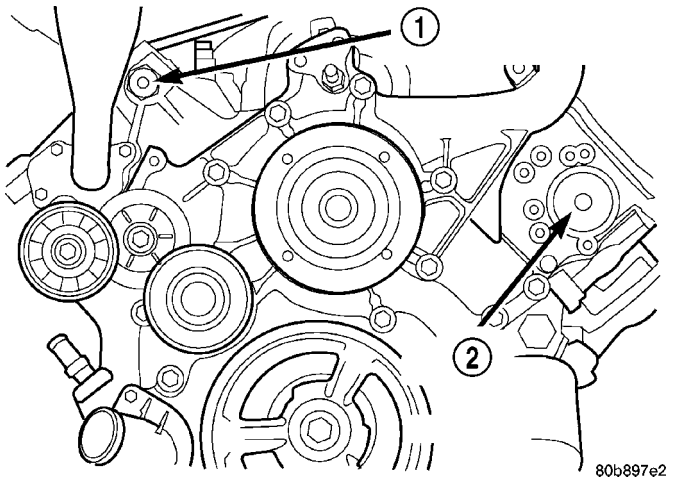

Fig. 20 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

INSTALLATION - RIGHT CYLINDER HEAD

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 21).

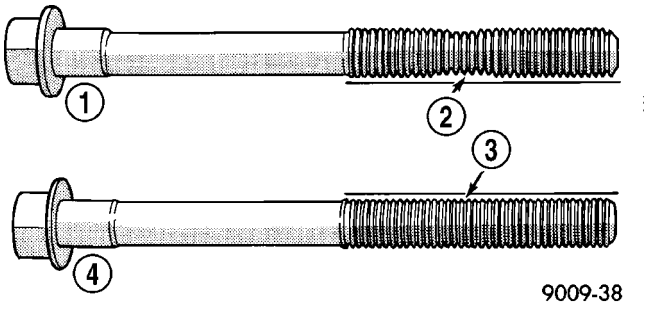

Fig. 21 Checking Cylinder Head Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Fig. 22).

(2) Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the ten M10 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar® Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

CYLINDER HEAD (Continued)

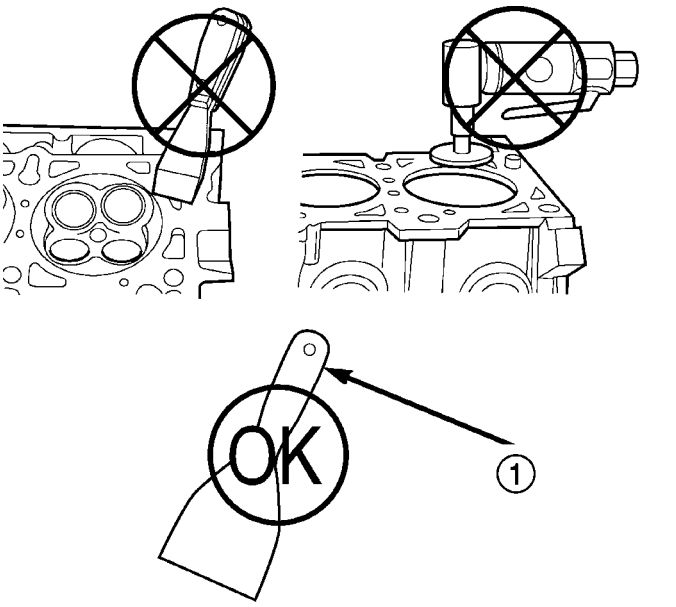

Fig. 22 Proper Tool Usage for

1 - PLASTIC/WOOD SCRAPER

(6) Tighten the bolts in sequence (Fig. 23) using the following steps and torque values:

- Step 1: Tighten bolts 1–10, 20 N·m (15 ft. lbs.).
- Step 2: Tighten bolts 1–10, 47 N·m (35 ft. lbs.). Tighten bolts 11–14, 25 N·m (18 ft. lbs.).
- Step 3: Tighten bolts 1–10, 90 degrees. Tighten bolts 11–14, 30 N·m (22 ft. lbs.).

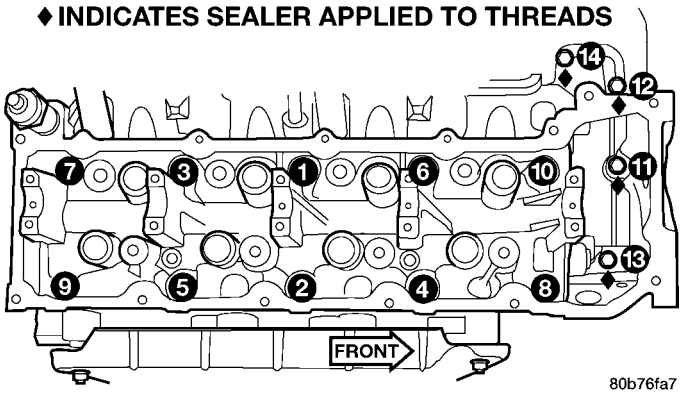

Fig. 23 Cylinder Head Tightening Sequence

(7) Position the secondary chain onto the camshaft drive gear, making sure one marked chain link is on either side of the V8 mark on the gear and position the gear onto the camshaft.

(8) Install the camshaft drive gear retaining bolt.

(9) Install the right side secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(10) Install the right side cylinder head access plug (Fig. 24).

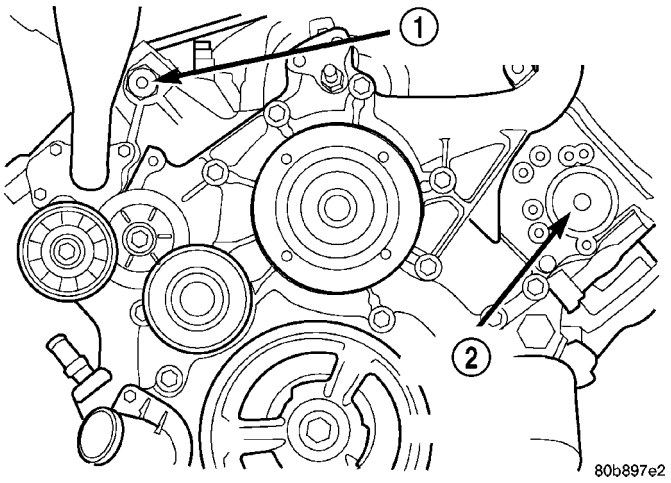

Fig. 24 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

(11) Re-set and install the right side secondary chain tensioner.

(12) Remove Special Tool 8515.

(13) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(14) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(15) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(16) Install the fan shroud.

(17) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(18) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(19) Install oil fill housing onto cylinder head.

(20) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Raise the vehicle.

(22) Install the exhaust pipe onto the right exhaust manifold.

(23) Lower the vehicle.

(24) Reconnect battery negitive cable.

(25) Start the engine and check for leaks.

CAMSHAFT(S) - LEFT

DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. A steel post or nose piece is friction-welded to the steel camshaft tube. Five bearing journals are machined into

CAMSHAFT(S) - LEFT (Continued)

the camshaft, four on the steel tube and one on the steel nose piece. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

REMOVAL

CAUTION: When the timing chain is removed and the cylinder heads are still installed, DO NOT forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use Special Tool 8350 will result in hydraulic tensioner ratchet over extension, requiring timing chain cover removal to reset the tensioner ratchet.

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Set engine to TDC cylinder #1, camshaft sprocket V8 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V8 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel (Located on the right side camshaft sprocket) for any reason, Severe damage will occur to the target wheel resulting in a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave the bolt snug against the sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8350 timing chain wedge between the timing chain strands, tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 25).

NOTE: When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

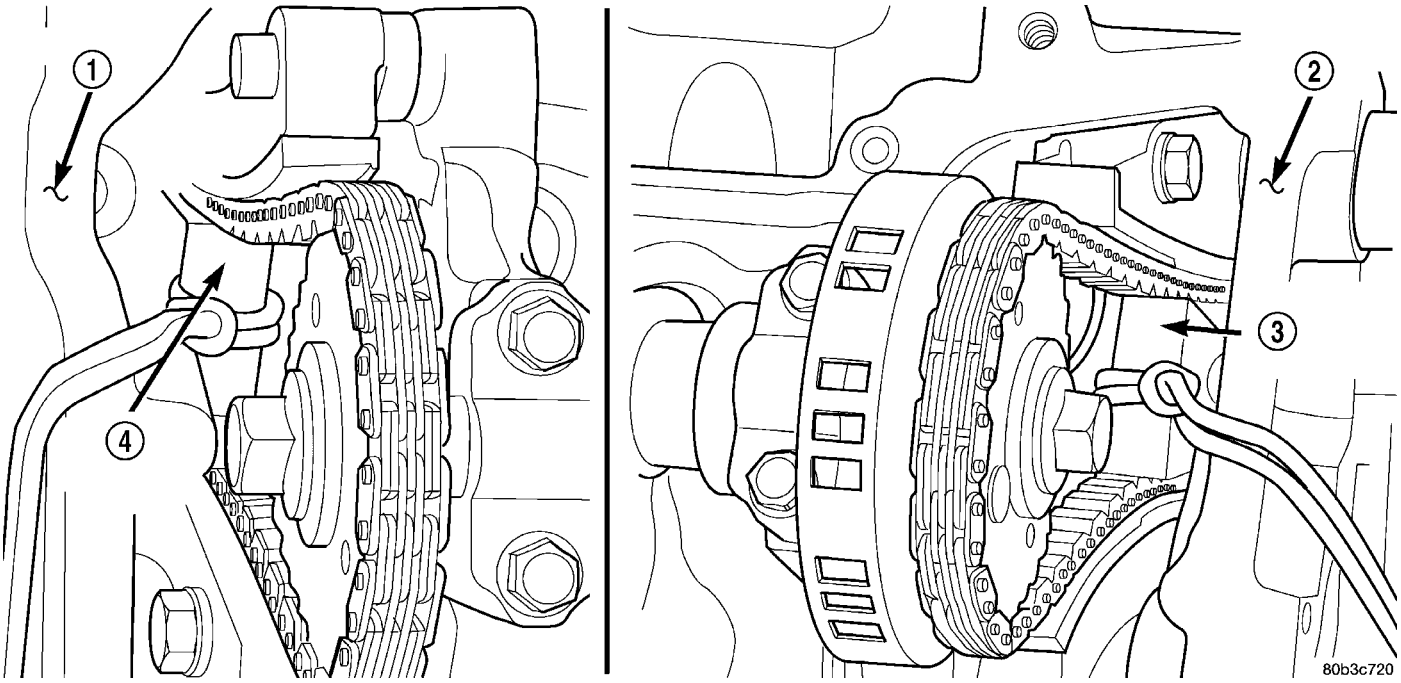

Fig. 25 Securing Timing Chain Tensioners Using Timing Chain Wedge

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD
3 - SPECIAL TOOL 8350 WEDGE
4 - SPECIAL TOOL 8350 WEDGE

CAMSHAFT(S) - LEFT (Continued)

(6) Hold the camshaft with adjustable pliers while removing the camshaft sprocket bolt and sprocket (Fig. 26).

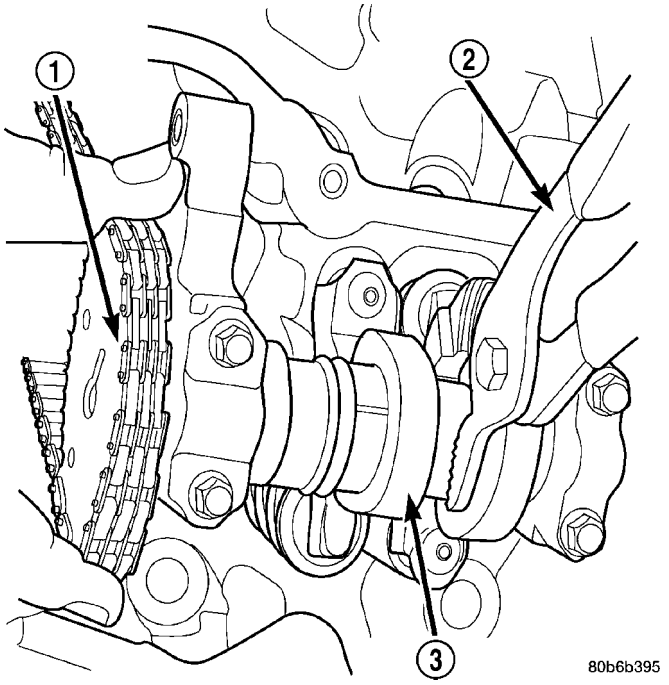

Fig. 26 Camshaft Sprocket and Chain

1 - CAMSHAFT SPROCKET AND CHAIN
2 - ADJUSTABLE PLIERS
3 - CAMSHAFT

(7) Using the pliers, gently allow the camshaft to rotate 15° clockwise until the camshaft is in the neutral position (no valve load).

(8) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

(9) Remove the camshaft bearing caps and the camshaft.

INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

NOTE: Position the left side camshaft so that the camshaft sprocket dowel is near the 1 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

(4) Working in ½ turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 27).

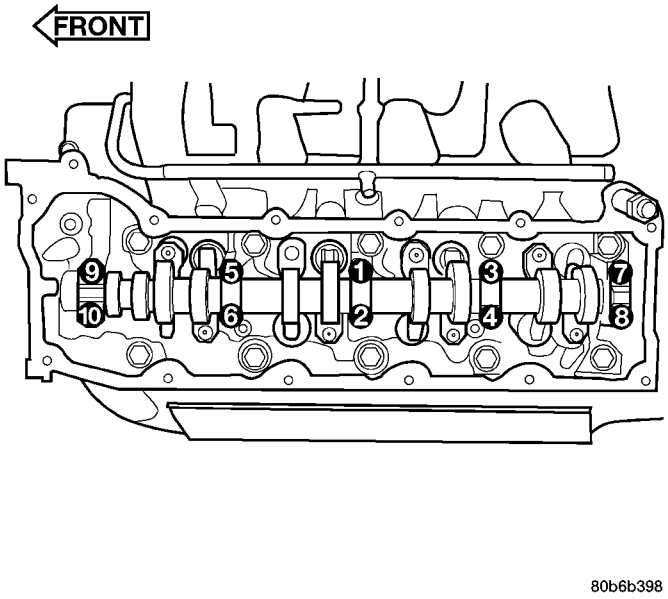

Fig. 27 Camshaft Bearing Caps Tightening Sequence

CAMSHAFT(S) - LEFT (Continued)

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

(6) Position the camshaft drive gear into the timing chain aligning the V8 mark between the two marked chain links (Two links marked during removal) (Fig. 28).

NOTE: When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(7) Using the adjustable pliers, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft (Fig. 29).

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt overtorque resulting in bolt failure.

4 - SPECIAL TOOL 6958 SPANNER WITH ADAPTER PINS 8346

CAMSHAFT(S) - RIGHT

DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. A steel post or nose piece is friction-welded to the steel camshaft tube. Five bearing journals are machined into the camshaft, four on the steel tube and one on the steel nose piece. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

REMOVAL

CAUTION: When the timing chain is removed and the cylinder heads are still installed, DO NOT forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use special tool 8350 will result in hydraulic tensioner ratchet over extension, Requiring timing chain cover removal to re-set the tensioner ratchet.

(1) Remove the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Set engine to TDC cylinder #1, camshaft sprocket V8 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V8 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel for any reason, Severe damage will occur to the target wheel. A damaged target wheel could cause a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave bolt snug against sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8350 timing chain wedge between the timing chain strands. Tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 32).

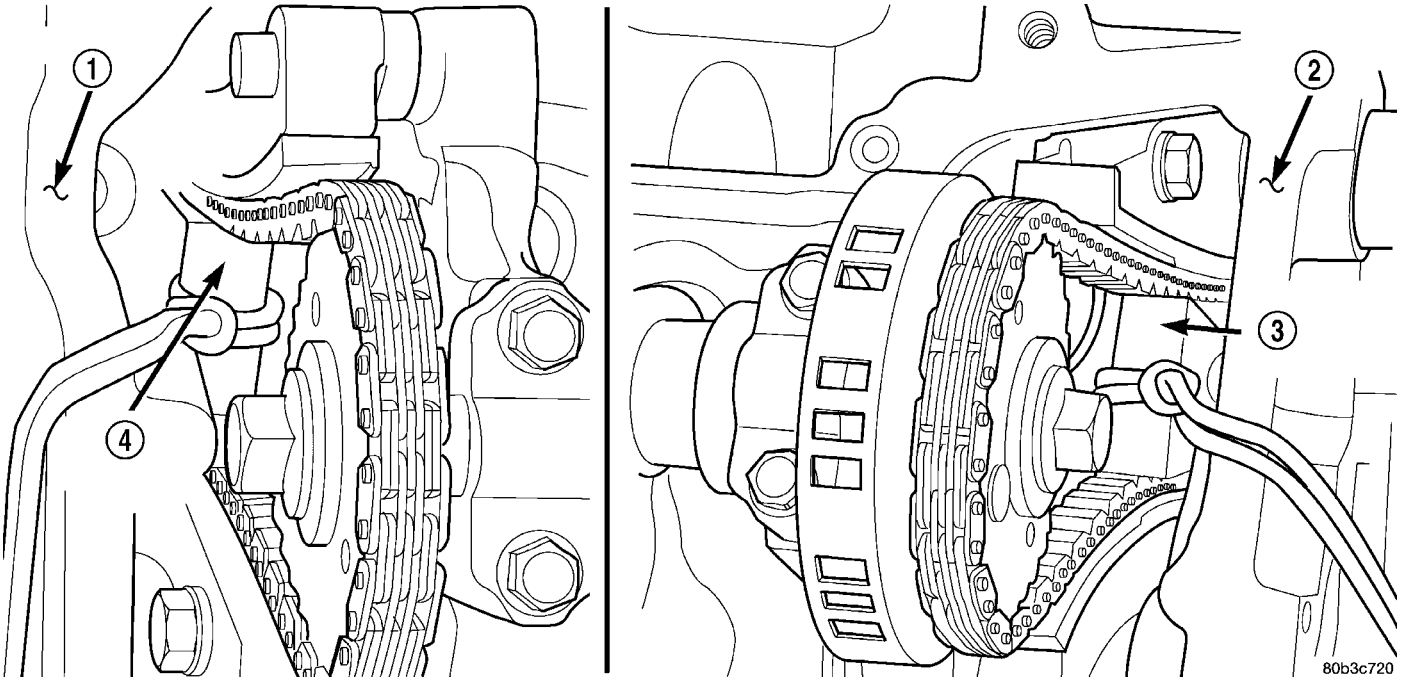

Fig. 32 Securing Timing Chain Tensioners Using Timing Chain Wedge

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD
3 - SPECIAL TOOL 8350 WEDGE
4 - SPECIAL TOOL 8350 WEDGE

CAMSHAFT(S) - RIGHT (Continued)

(6) Remove the camshaft position sensor (Fig. 33).

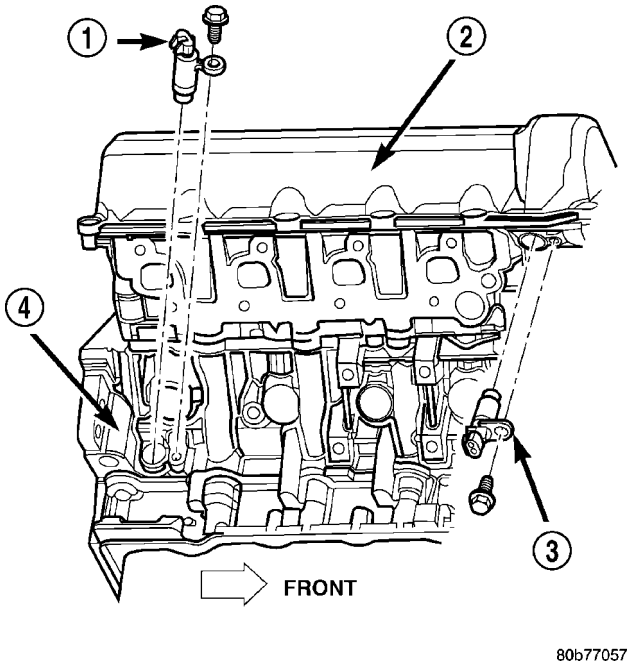

Fig. 33 Camshaft Position Sensor

1 - CRANKSHAFT POSITION SENSOR
2 - CYLINDER HEAD COVER
3 - CAMSHAFT POSITION SENSOR
4 - RIGHT SIDE CYLINDER BLOCK

NOTE: When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(7) Hold the camshaft with adjustable pliers while removing the camshaft sprocket bolt and sprocket (Fig. 34).

(8) Using the pliers, gently allow the camshaft to rotate 45° counter-clockwise until the camshaft is in the neutral position (no valve load).

(9) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

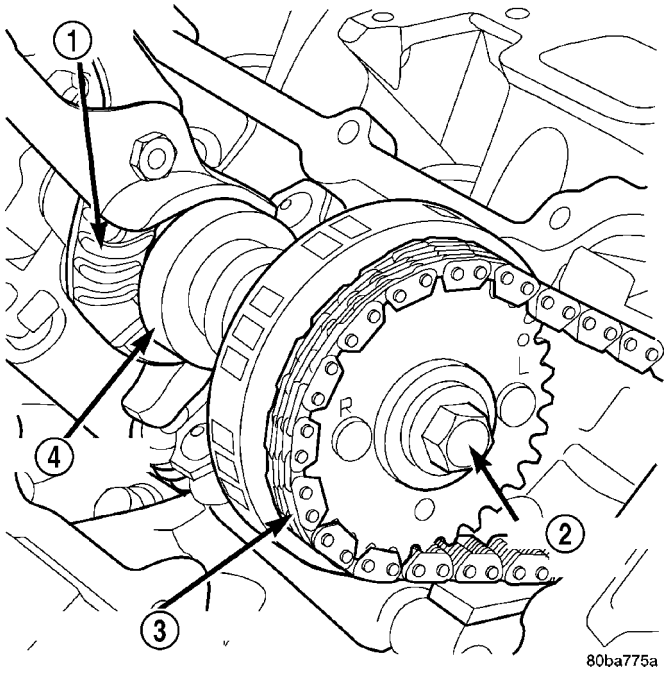

Fig. 34 Camshaft Sprocket and Chain

1 - ADJUSTABLE PLIERS
2 - SPROCKET BOLT
3 - CAMSHAFT SPROCKET AND CHAIN
4 - CAMSHAFT

(10) Remove the camshaft bearing caps and the camshaft.

INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

NOTE: Position the right side camshaft so that the camshaft sprocket dowel is near the 10 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

CAMSHAFT(S) - RIGHT (Continued)

(4) Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 35).

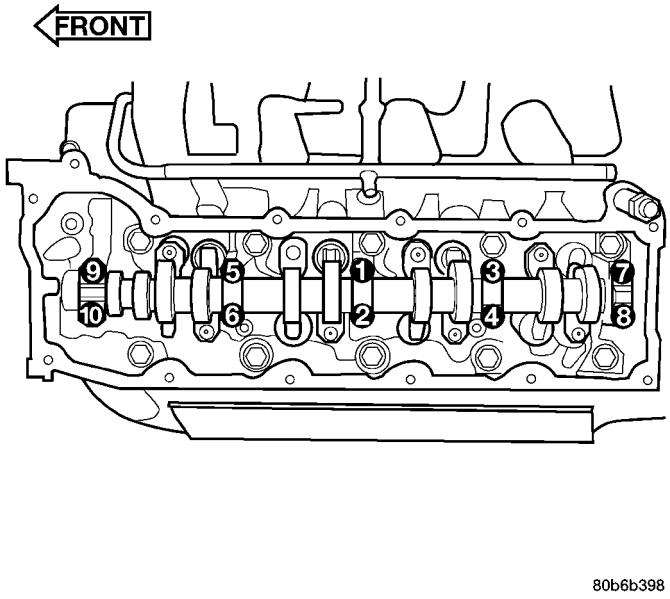

Fig. 35 Camshaft Bearing Caps Tightening Sequence

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

(6) Position the camshaft drive gear into the timing chain aligning the V8 mark between the two marked chain links (Two links marked during removal) (Fig. 36).

NOTE: When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(7) Using the adjustable pliers, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft (Fig. 37).

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt overtorque resulting in bolt failure.

(8) Remove excess oil from camshaft sprocket bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove timing chain wedge special tool 8350 (Fig. 32).

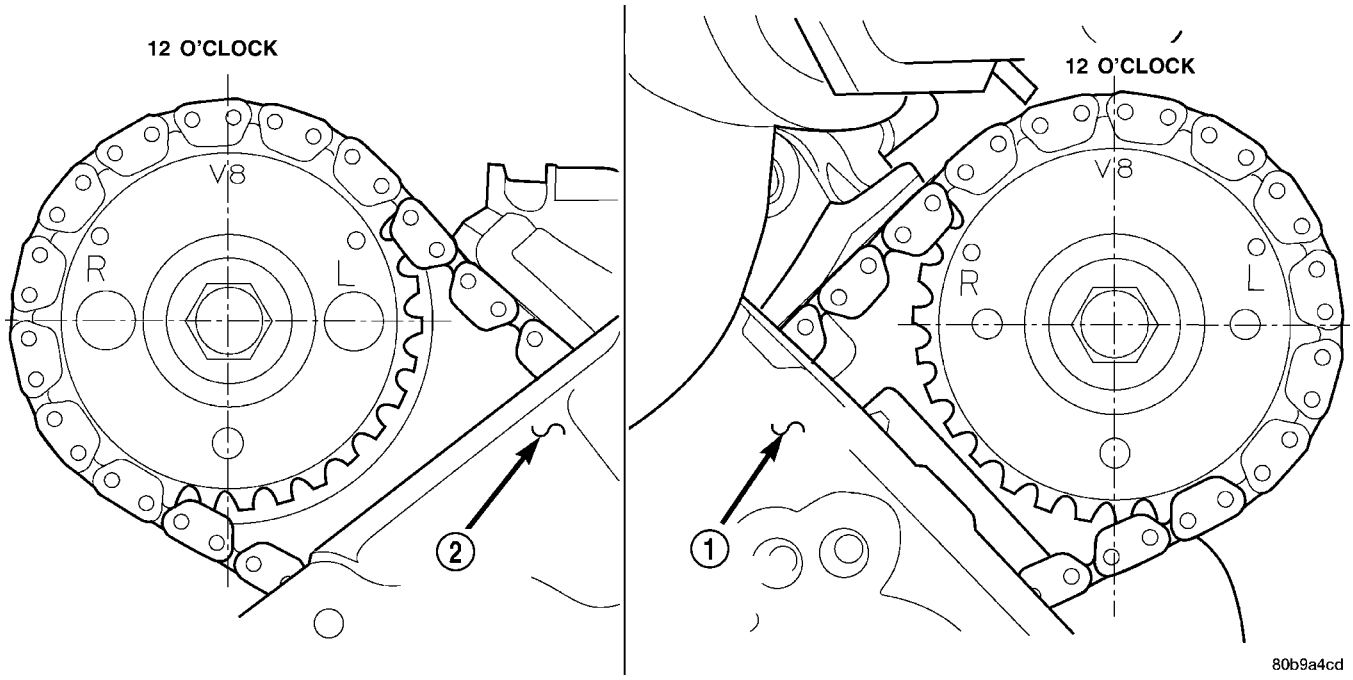

Fig. 36 Timing Chain to Sprocket Alignment

2 - CAMSHAFT DOWEL

(10) Using Special Tool 6958 spanner wrench with adapter pins 8346 (Fig. 38), torque the camshaft sprocket retaining bolt to 122 N·m (90 ft. lbs.).

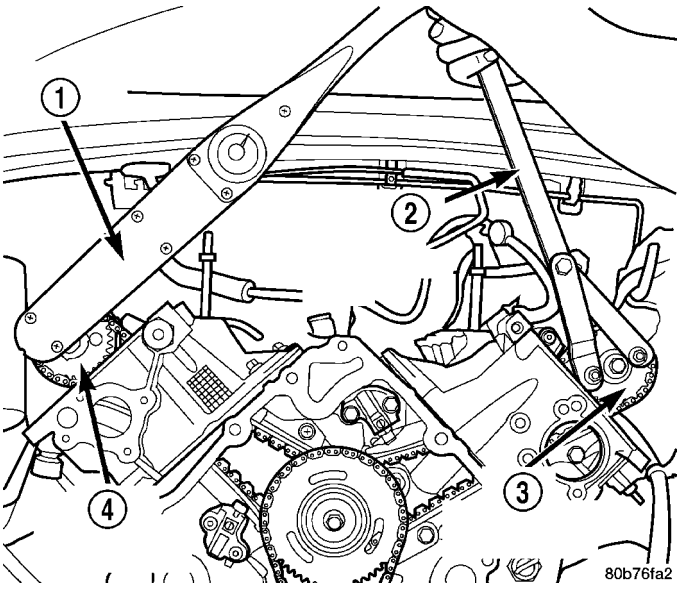

Fig. 38 Tightening Right Side Cam Sprocket Retaining Bolt

1 - TORQUE WRENCH
2 - SPECIAL TOOL 6958 WITH ADAPTER PINS 8346
3 - LEFT CAMSHAFT SPROCKET
4 - RIGHT CAMSHAFT SPROCKET

(11) Install the camshaft position sensor (Fig. 33).

(12) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

CYLINDER HEAD COVER(S)

DESCRIPTION

The cylinder head covers are made of injection molded thermo-set plastic, and are not interchangeable from side-to-side. It is imperative that nothing rest on the cylinder head covers. Prolonged contact with other items may wear a hole in the cylinder head cover.

REMOVAL

REMOVAL - RIGHT SIDE

(1) Disconnect battery negative cable.
(2) Remove air cleaner assembly, resonator assembly and air inlet hose.
(3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(4) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Remove air conditioning compressor retaining bolts and move compressor to the left.
(6) Remove heater hoses.
(7) Disconnect injector and ignition coil connectors.
(8) Disconnect and remove positive crankcase ventilation (PCV) hose.
(9) Remove oil fill tube.
(10) Un-clip injector and ignition coil harness and move away from cylinder head cover.
(11) Remove right rear breather tube and filter assembly.
(12) Remove cylinder head cover retaining bolts.
(13) Remove cylinder head cover.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

REMOVAL - LEFT SIDE

(1) Disconnect negative cable from battery.
(2) Remove the resonator assemble and air inlet hose.
(3) Disconnect injector connectors and un-clip the injector harness.
(4) Route injector harness in front of cylinder head cover.
(5) Disconnect the left side breather tube and remove the breather tube.
(6) Remove the cylinder head cover mounting bolts.

CYLINDER HEAD COVER(S) (Continued)

(7) Remove cylinder head cover and gasket.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

CLEANING

Clean cylinder head cover gasket surface.
Clean head rail, if necessary.

INSTALLATION

INSTALLATION - RIGHT SIDE

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
(2) Install cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location shown in (Fig. 39).

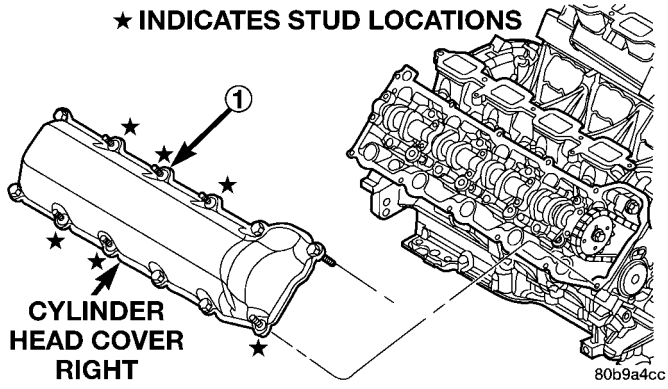

Fig. 39 Cylinder Head Cover—Right

ITEM	DESCRIPTION	TORQUE
1	Cover Fasteners	12 N·m (105 in. lbs.)

(3) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs).
(4) Install right rear breather tube and filter assembly.
(5) Connect injector, ignition coil electrical connectors and harness retaining clips.
(6) Install the oil fill tube.
(7) Install PCV hose.
(8) Install heater hoses.
(9) Install air conditioning compressor retaining bolts.
(10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(11) Fill Cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(12) Install air cleaner assembly, resonator assembly and air inlet hose.
(13) Connect battery negative cable.

INSTALLATION—LEFT SIDE

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
(2) Install cylinder head cover and hand start all fasteners. Verify that all studs are in the correct location shown in (Fig. 40).

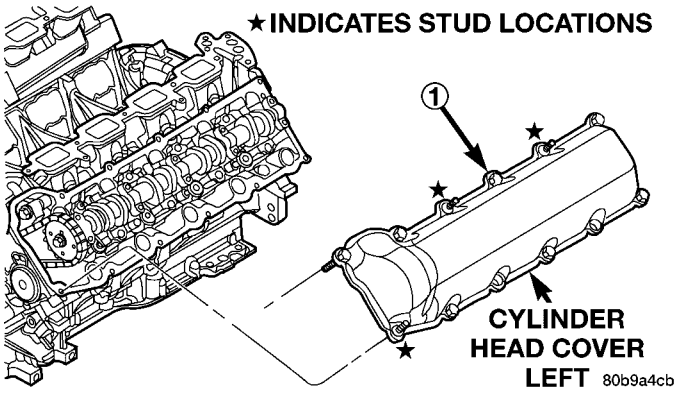

Fig. 40 Cylinder Head Cover-Left

ITEM	DESCRIPTION	TORQUE
1	Cover Fasteners	12 N·m (105 in. lbs.)

(3) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs.).
(4) Install left side breather and connect breather tube.
(5) Connect injector electrical connectors and injector harness retaining clips.
(6) Install the resonator and air inlet hose.
(7) Connect negative cable to battery.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

INTAKE/EXHAUST VALVES & SEATS (Continued)

REMOVAL

NOTE: The cylinder heads must be removed in order to perform this procedure.

(1) Remove rocker arms and lash adjusters(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). (Fig. 41).

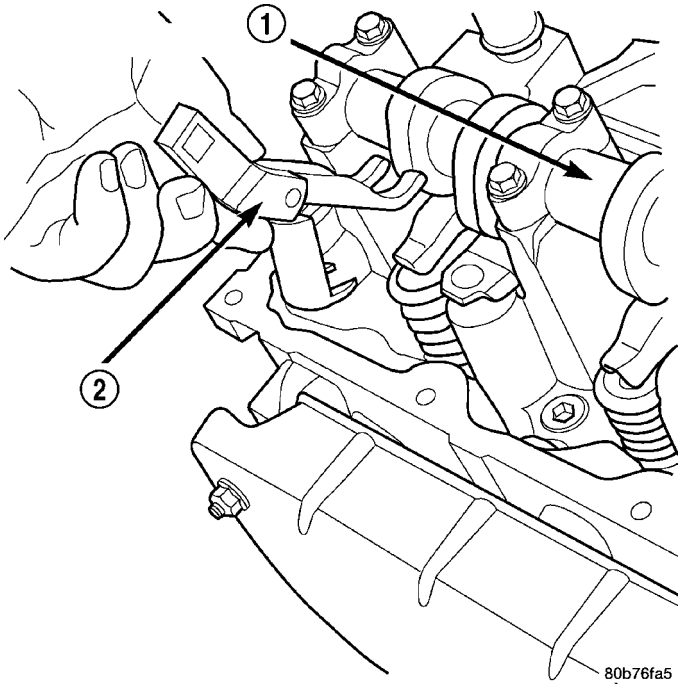

Fig. 41 Rocker Arm Removal

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

(2) Remove the camshaft bearing caps and the camshaft.

NOTE: All six valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

(3) Using Special Tool C-3422–B or C-3422–C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(4) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(5) Remove the valve spring compressor.
(6) Remove the spring retainer, and the spring.

NOTE: Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

(7) Remove the valve from the cylinder head.

NOTE: The valve stem seals are common between intake and exhaust.

(8) Remove the valve stem seal. Mark the valve for proper installation.

TESTING VALVE SPRINGS

NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until a Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications (Fig. 42).

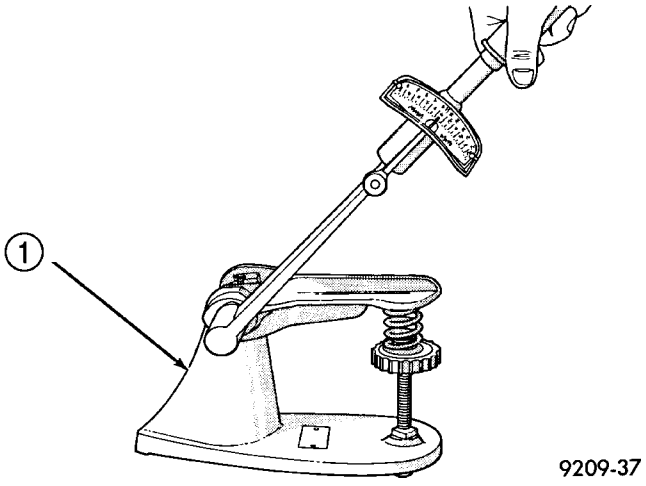

Fig. 42 Testing Valve Springs

1 - SPECIAL TOOL C-647

INSTALLATION

(1) coat the valve stem with clean engine oil and insert it into the cylinder head.
(2) Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(3) Install the spring and the spring retainer (Fig. 43).

(4) Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.

(5) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

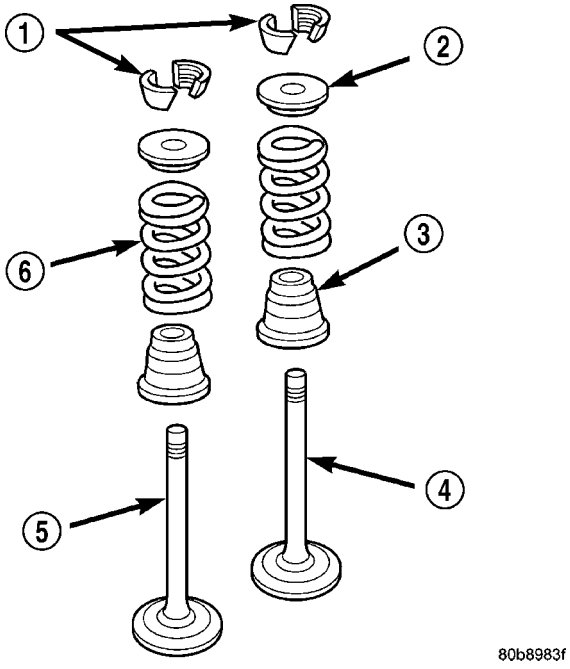

Fig. 43 Valve Assembly Configuration

1 - VALVE LOCKS (3–BEAD)
2 - RETAINER
3 - VALVE STEM OIL SEAL
4 - INTAKE VALVE
5 - EXHAUST VALVE
6 - VALVE SPRING

(6) lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.

(7) Install the camshaft bearing cap retaining bolts. Tighten the bolts 9–13 N·m (100 in. lbs.) in ½ turn increments in the sequence shown (Fig. 44).

(8) Position the hydraulic lash adjusters and rocker arms.

ROCKER ARM / ADJUSTER ASSEMBLY

DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8

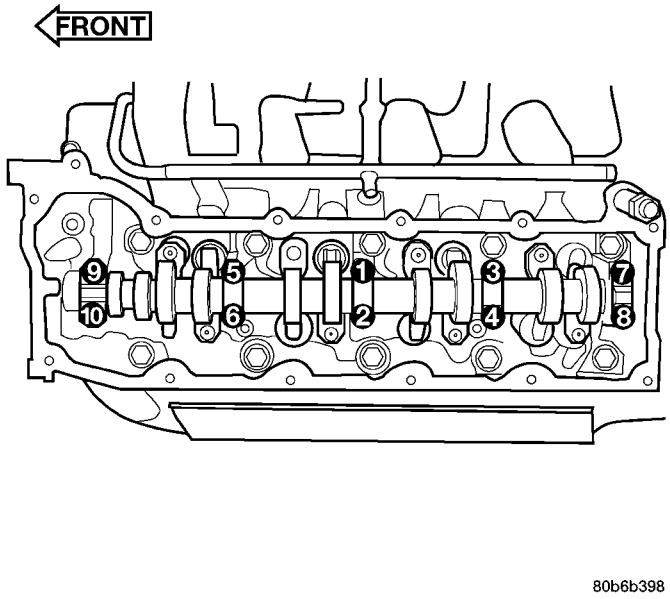

Fig. 44 Camshaft Bearing Caps Tightening Sequence

mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

DIAGNOSIS AND TESTING - HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Oil leak or excessive cam bore wear in cylinder head.

(11) Faulty lash adjuster.

a. Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

b. Remove suspected lash adjusters, and replace.

c. Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

REMOVAL

NOTE: Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) For rocker arm removal on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(3) For rocker arm removal on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(4) For rocker arm removal on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(5) For rocker arm removal on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(6) Using special tool 8516 Rocker Arm Remover, press downward on the valve spring, remove rocker arm (Fig. 45).

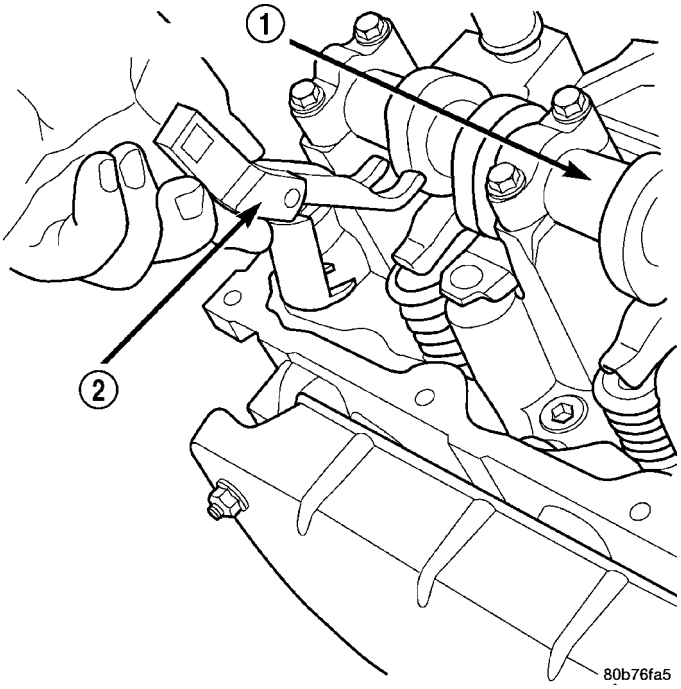

Fig. 45 Rocker Arm—Removal

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

INSTALLATION

CAUTION: Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

NOTE: Coat the rocker arms with clean engine oil prior to installation.

(1) For rocker arm installation on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(2) For rocker arm installation on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(3) For rocker arm installation on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(4) For rocker arm installation on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(5) Using special tool 8516 press downward on the valve spring, install rocker arm (Fig. 45).

(6) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVE SPRINGS

DESCRIPTION

The valve springs are made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

REMOVAL

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Using Special Tool 8516 Rocker Arm Remover, remove the rocker arms and the hydraulic lash adjusters (Fig. 46).

(3) Remove the spark plug for the cylinder the valve spring and seal are to be removed from.

(4) Apply shop air to the cylinder to hold the valves in place when the spring is removed

(5) Remove the camshaft (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

NOTE: All eight valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

VALVE SPRINGS (Continued)

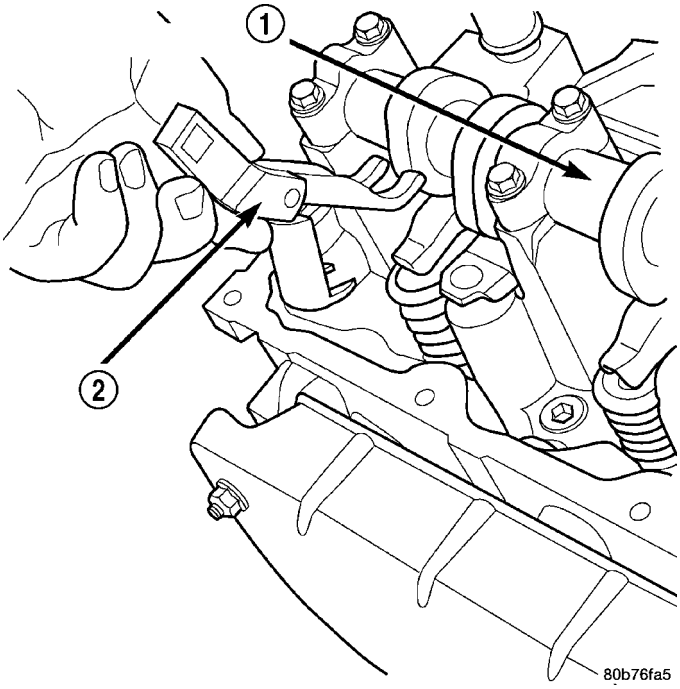

Fig. 46 Rocker Arm—Removal

1 - CAMSHAFT
2 - SPECIAL TOOL 8516

(6) Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(7) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

(8) Remove the valve spring compressor.
(9) Remove the spring retainer, and the spring.
(10) Remove the valve stem seal.

NOTE: The valve stem seals are common between intake and exhaust.

INSTALLATION

(1) coat the valve stem with clean engine oil and install the valve stem seal. Make sure the seal is fully seated and that the garter spring at the top of the seal is intact.
(2) Install the spring and the spring retainer (Fig. 47).
(3) Using Special Tool 8387 Valve Spring Compressor, compress the spring and install the two valve spring retainer halves.
(4) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

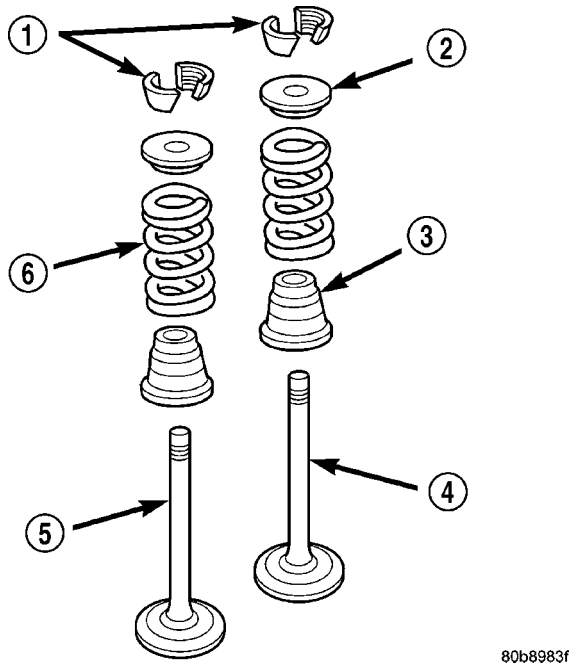

Fig. 47 Valve Assembly Configuration

1 - VALVE LOCKS (3–BEAD)
2 - RETAINER
3 - VALVE STEM OIL SEAL
4 - INTAKE VALVE
5 - EXHAUST VALVE
6 - VALVE SPRING

(5) Install the camshaft (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
(6) Position the hydraulic lash adjusters and rocker arms (Fig. 46).
(7) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVE STEM SEALS

DESCRIPTION

The valve stem seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

ENGINE BLOCK

DESCRIPTION

The cylinder block is made of cast iron. The block is a closed deck design with the left bank forward. To provide high rigidity and improved NVH an enhanced compacted graphite bedplate is bolted to the block. The block design allows coolant flow between the cylinders bores, and an internal coolant bypass to a single poppet inlet thermostat is included in the cast aluminum front cover.

STANDARD PROCEDURE - CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 48).

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

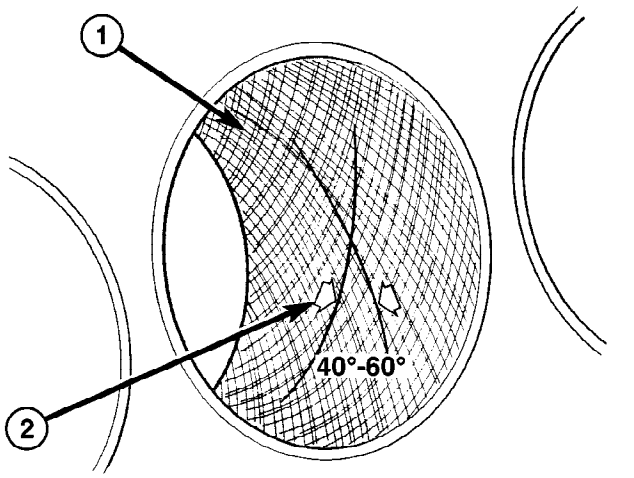

Fig. 48 CYLINDER BORE CROSSHATCH PATTERN

1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the 1/4 inch NPT plugs to 20 N·m (177 in. lbs.) torque. Tighten the 3/8 inch NPT plugs to 27 N·m (240 in. lbs.) torque.

INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer (Fig. 49).

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat

ENGINE BLOCK (Continued)

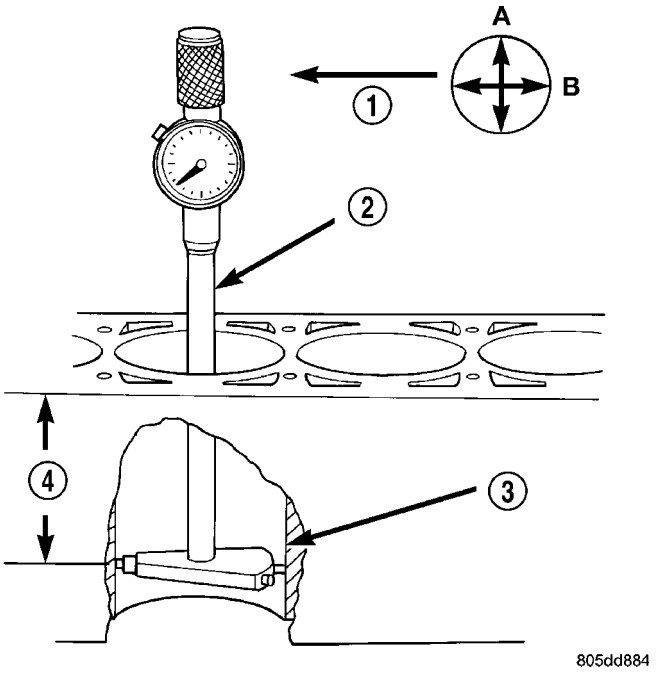

Fig. 49 BORE GAUGE-TYPICAL

1 - FRONT
2 - BORE GAUGE
3 - CYLINDER BORE
4 - 38 MM (1.5 in)

the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING ROD BEARING FITTING

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 50). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 51). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

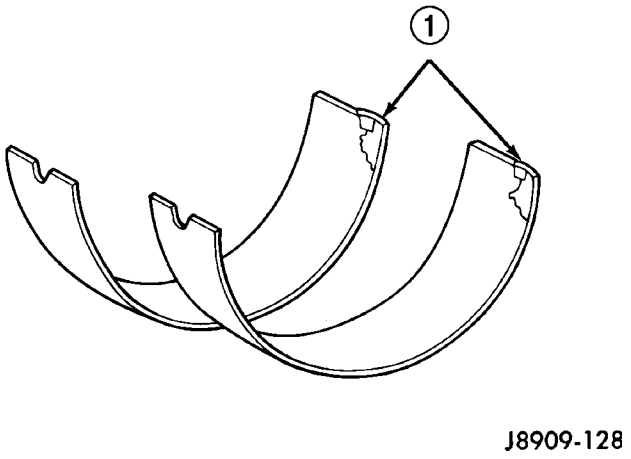

Fig. 50 Locking Tab Inspection

1 - ABNORMAL CONTACT AREA CAUSED BY LOCKING TABS NOT FULLY SEATED OR BEING BENT

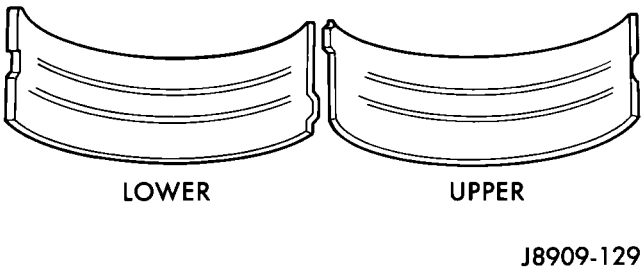

Fig. 51 Scoring Caused by Insufficient Lubrication or Damaged Crankshaft Journal

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

(1) Wipe the oil from the connecting rod journal.

(2) Lubricate the upper bearing insert and install in connecting rod.

(3) Use piston ring compressor and Guide Pins Special Tool 8507 (Fig. 52) to install the rod and piston assemblies. The oil slinger slots in the rods must face front of the engine. The “F”’s near the piston wrist pin bore should point to the front of the engine.

(4) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

(5) Install bearing cap and connecting rod on the journal and tighten bolts to 27 N·m (20 ft. lbs.) plus a 90° turn. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

CONNECTING ROD BEARINGS (Continued)

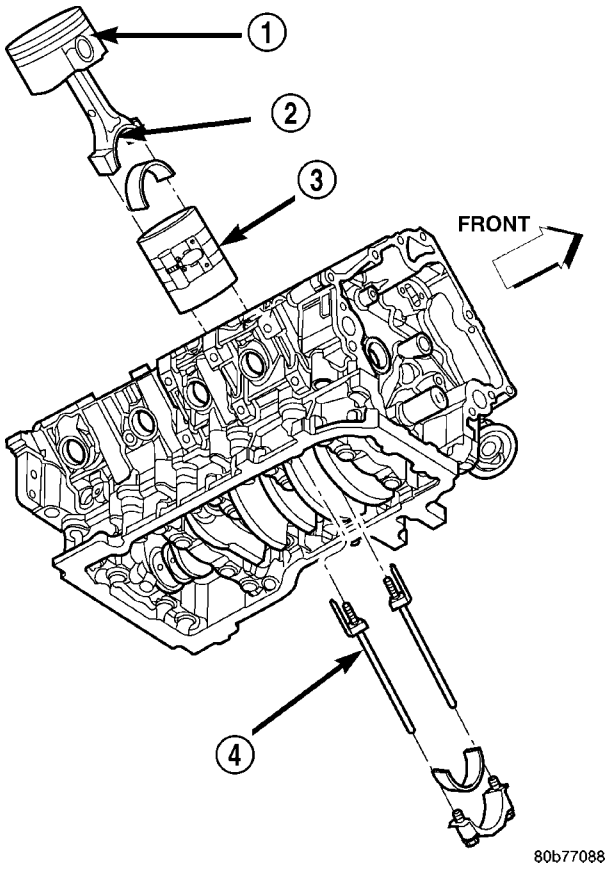

Fig. 52 Piston and Connecting Rod - Installation

1 - "F" TOWARD FRONT OF ENGINE
2 - OIL SLINGER SLOT
3 - RING COMPRESSOR
4 - SPECIAL TOOL 8507

(6) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 53). Refer to Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

(7) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

(8) If bearing-to-journal clearance exceeds the specification, determin which services bearing set to use the bearing sizes are as follows:

Bearing Mark	SIZE	USED WITH JOURNAL SIZE
.025 US	.025 mm (.001 in.)	50.983-50.967 mm (2.0073-2.0066 in.)
Std.	STANDARD	50.992-51.008 mm (2.0076-2.0082 in.)
.250 US	.250 mm (.010 in.)	50.758-50.742 mm (1.9984-1.9978 in.)

(9) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

(10) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 27 N·m (20 ft. lbs.) plus a 90° turn.

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 54). Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

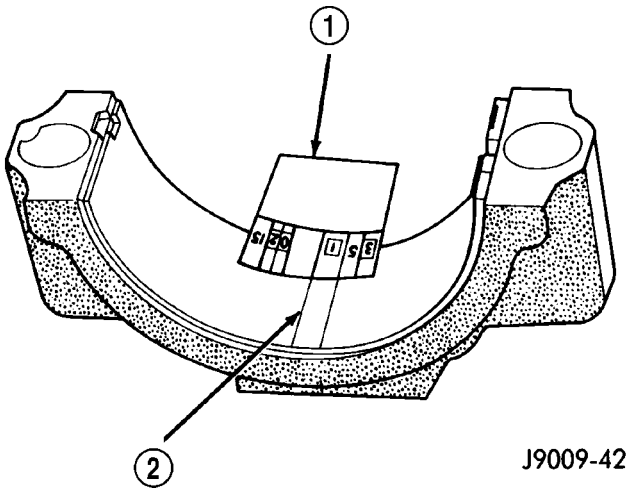

Fig. 53 Measuring Bearing Clearance with Plastigage

1 - PLASTIGAGE SCALE
2 - COMPRESSED PLASTIGAGE

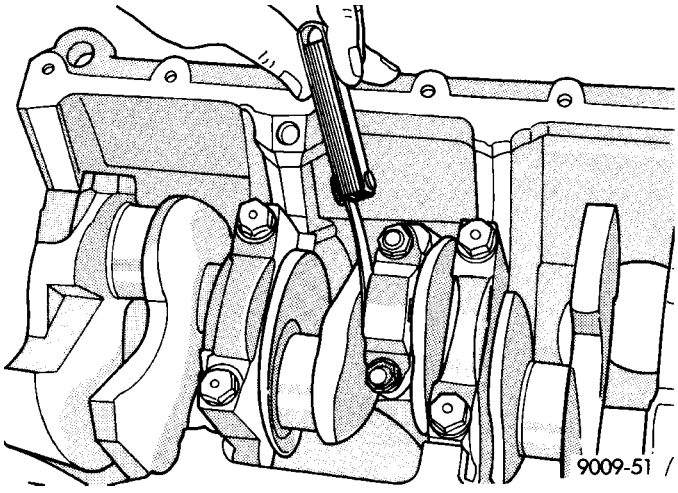

Fig. 54 Checking Connecting Rod Side Clearance - Typical

CORE PLUGS

REMOVAL

(1) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(2) Using a blunt tool such as a drift or a screw driver and a hammer, strike the bottom edge of the cup plug (Fig. 55)

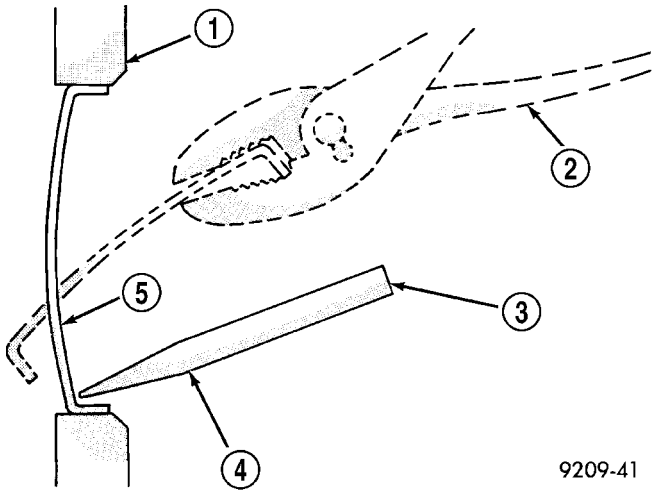

Fig. 55 Engine Core Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

(3) Using a suitable pair of pliers, grasp the core plug and remove.

INSTALLATION

NOTE: Thoroughly clean core plug bore, remove all of the old sealer.

(1) Coat the edges of the engine core plug and the core plug bore with Mopar Gasket Maker, or equivalent.

NOTE: It is not necessary to wait for the sealant to cure on the core plugs. The cooling system can be filled and the vehicle returned to service immediately.

(2) Using proper plug driver, drive core plug into the core plug bore. The sharp edge of the core plug should be at least 0.50 mm (0.020 in.) inside the lead in chamfer.

(3) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

CRANKSHAFT

DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a crosshaped four throw design with eight counterweights for balancing purposes. The crankshaft is supported by five select fit main bearings with the number three serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The number eight counterweight has provisions for crankshaft position sensor target wheel mounting. The select fit main bearing markings are located on the rear side of the target wheel. The crankshaft oil seals are one piece design. The front oil seal is retained in the timing chain cover, and the rear seal is pressed in to a bore formed by the cylinder block and the bedplate assembly.

REMOVAL

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

(1) Remove the engine. (Refer to 9 - ENGINE - REMOVAL).

(2) Remove the engine oil pump.(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

CAUTION: DO NOT pry on the oil pan gasket when removing the oil pan, The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when removing oil pan. Gasket can not be removed with oil pan.

(3) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove the oil pump pickup tube and oil pan gasket /windage tray.

(5) Remove the bedplate mounting bolts. Note the location of the three stud bolts for installation.

(6) Remove the connecting rods from the crankshaft.

CAUTION: The bedplate to cylinder block mating surface is a critical sealing surface. Do not pry on or damage this surface in anyway.

NOTE: The bedplate contains the lower main bearing halves. Use care when handling bedplate as not to drop or damage bearing halves. Installing main bearing halves in the wrong position will cause sever damage to the crankshaft.

CRANKSHAFT (Continued)

NOTE: The bedplate has pry points cast into it. Use these points only. The pry points are on both the left and right sides, only the left side is shown.

(7) Carefully pry on the pry points (Fig. 56) to loosen the bedplate then remove the bedplate.

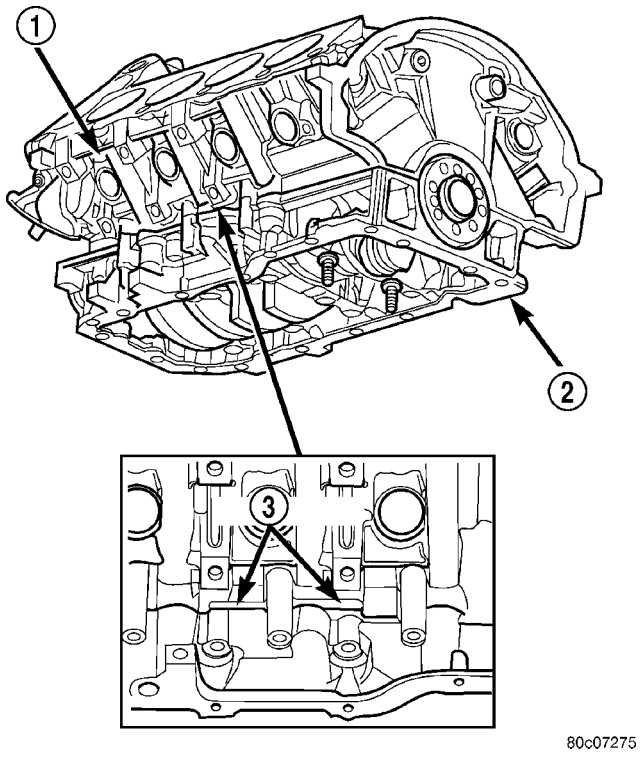

Fig. 56 Bedplate Pry Point Location

1 - CYLINDER BLOCK
2 - BEDPLATE
3 - PRY POINT

CAUTION: When removing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

(8) Remove the crankshaft.
(9) Remove the crankshaft target wheel.

INSPECTION

NOTE: Thoroughly inspect the connecting rod bearing bores and main bearing bores for scoring, blueing or severe scratches. Further disassembly may be required.

If connecting rod bearing bores show damage, the cylinder heads must be removed to service the piston and rod assemblies. If the bedplate or the cylinder block main bearing bores show damage the engine must be replaced.

(1) If required, remove the main bearing halves from the cylinder block and bedplate.

(2) Thoroughly clean the bedplate to cylinder block sealing surfaces and main bearing bores. Remove all oil and sealant residue.

(3) Inspect the bedplate main bearing bores for cracks, scoring or severe blueing. If either condition exists the engine must be replaced.

(4) Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing. If either condition exist replace the thrust washer.

(5) Inspect the oil pan gasket/windage tray for splits, tears or cracks in the gasket sealing surfaces. Replace gasket as necessary.

INSTALLATION

CAUTION: Main bearings are select fit. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) for proper bearing selections.

(1) Lubricate upper main bearing halves with clean engine oil.

CAUTION: When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

NOTE: Apply sealant to the target wheel retaining screws prior to installation.

(2) Install the crankshaft target wheel. Torque the mounting screws to 15 N·m (12 ft. lbs.).
(3) Position crankshaft in cylinder block.
(4) Install the thrust washers (Fig. 57).

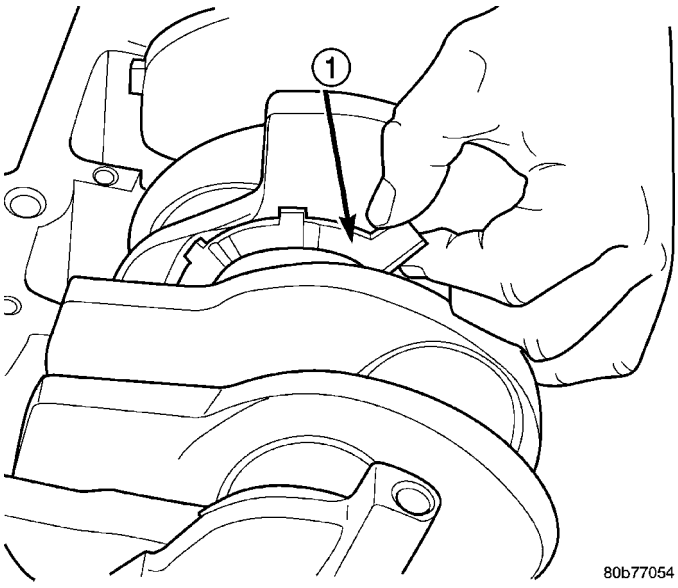

Fig. 57 Crankshaft Thrust Washer Installation

1 - CRANKSHAFT THRUST WASHER

CRANKSHAFT (Continued)

CAUTION: The bedplate to cylinder block mateing surface must be coated with sealant prior to installation. Failure to do so will cause severe oil leaks.

NOTE: The installation time to install the bedplate after the sealant has been applied is critical.

NOTE: Make sure that the bedplate and cylinder block sealing surfaces are clean and free of oil or other contaminants. Contaminants on the sealing surfaces may cause main bearing distortion and/or oil leaks.

(5) Apply a 2.5mm (0.100 inch) (Fig. 58) bead of Mopar® Gen II Silicone Rubber Adhesive sealant to the cylinder block-to-bedplate mating surface as shown (Fig. 59).

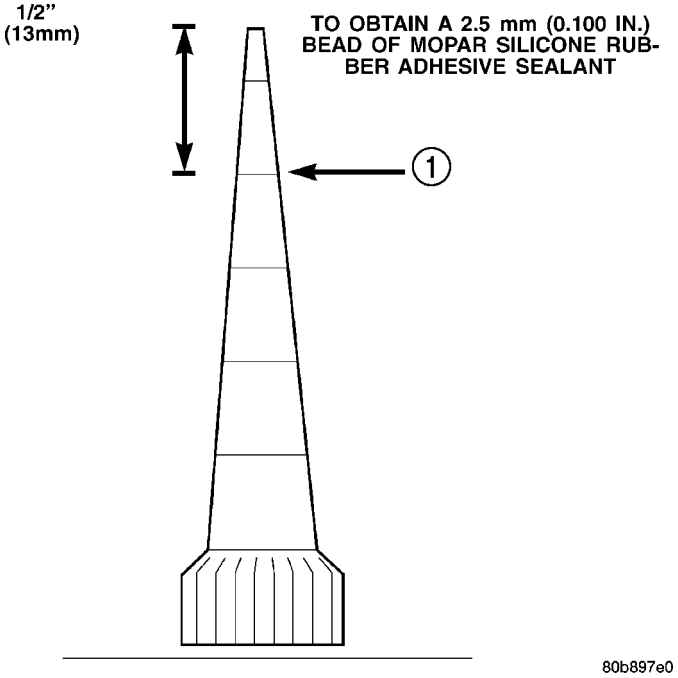

Fig. 58 Cutting Aplicator to Achieve 2.5mm (0.100 in.) Bead

1 - CUT HERE

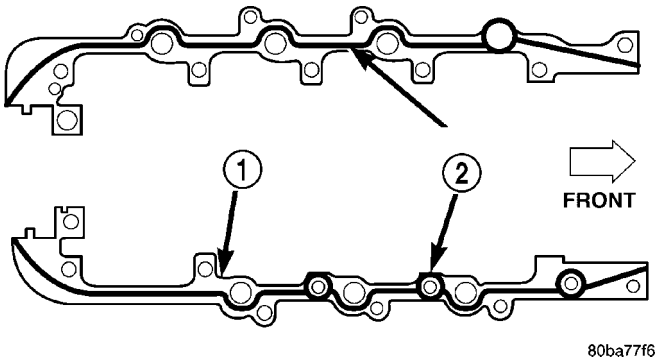

Fig. 59 Cylinder Block-to-Bedplate Sealent Bead Location

1 - CYLINDER BLOCK
2 - SEALANT BEAD LOCATION

(6) Coat the crankshaft main bearing journals with clean engine oil and position the bedplate onto the cylinder block.

NOTE: Lubricate the bedplate retaining bolts with clean engine oil prior to installation.

(7) Install the bedplate retaining bolts, making sure to place the stud bolts in the correct location, Torque the bolts in the sequence shown (Fig. 60).

- Tighten bolts **A – L** to 54 N·m (40 ft. lbs.)
- Tighten bolts **1–10** to 2.8 N·m (25 in. lbs.)
- Turn bolts **1–10** an additional 90°.
- Tighten bolts **A1– A6** to 27 N·m (20 ft. lbs.)

(8) Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

(9) Install the connecting rods and measure side clearance. (Refer to 9 - ENGINE/ENGINE BLOCK/ CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

CRANKSHAFT (Continued)

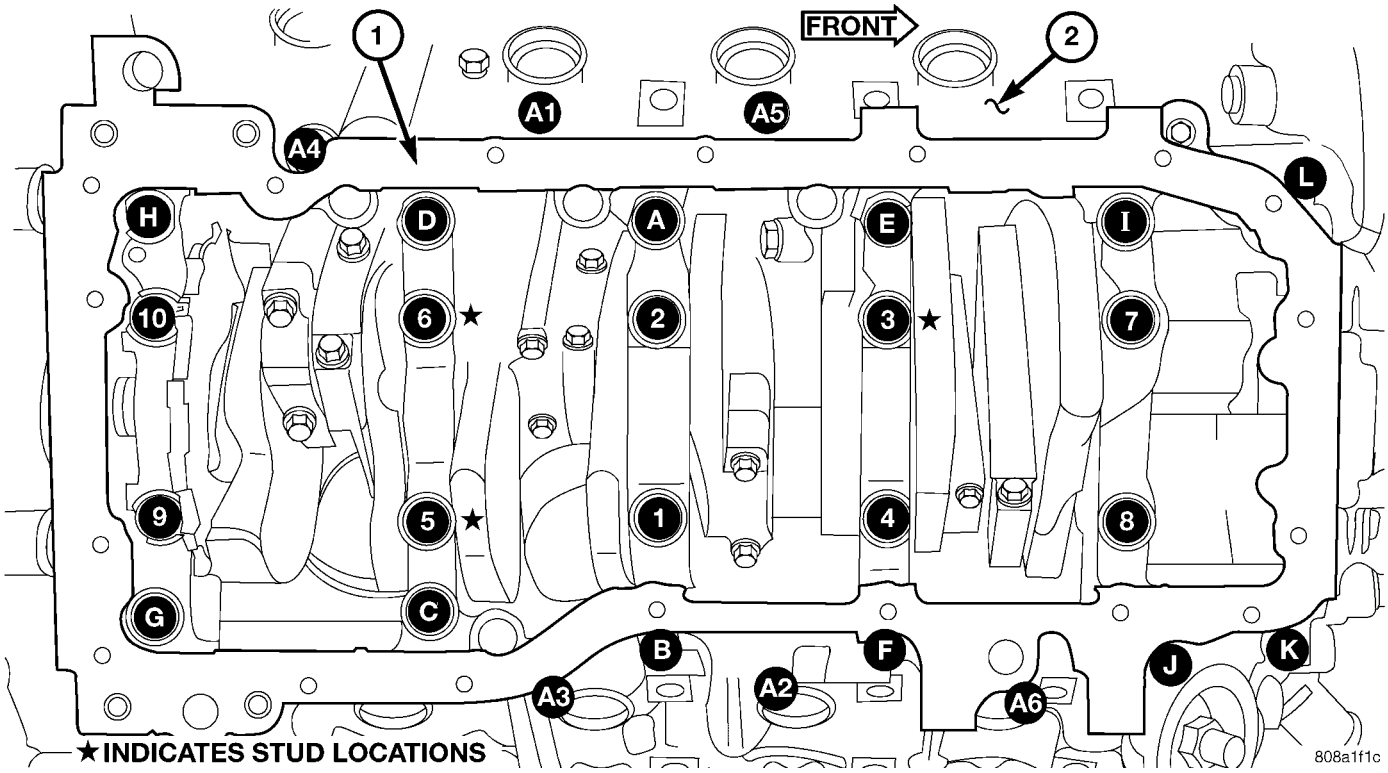

Fig. 60 Bedplate Tightening Sequence

1 - BEDPLATE
2 - CYLINDER BLOCK

(10) Position the oil pan gasket/windage tray, using a new o-ring, install the oil pickup tube. Torque the bolt to 28N·n (20 ft. lbs.) torque the nuts to 28N·m (20 ft. lbs.).

(11) Install the oil pan. Torque the retaining bolts to 15 N·m (11 ft. lbs.) in the sequence shown (Fig. 61).

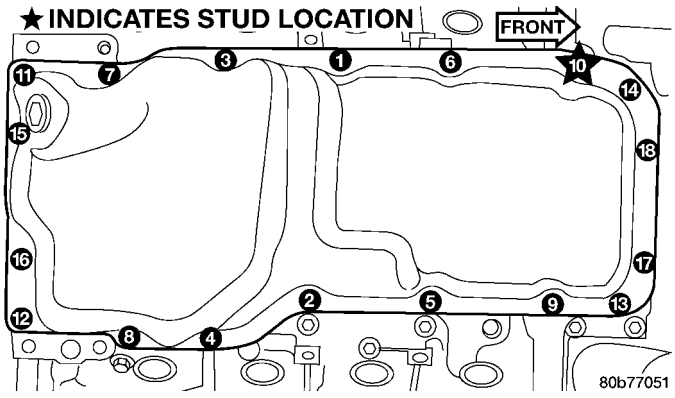

Fig. 61 Oil Pan Tightening Sequence

(12) Install the engine (Refer to 9 - ENGINE - INSTALLATION).

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE—CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crankshaft position sensor target wheel has grade identification marks stamped into it (Fig. 62). These marks are read from left to right, corresponding with jour-

CRANKSHAFT MAIN BEARINGS (Continued)

nal number 1, 2, 3, 4 and 5. The crankshaft position sensor target wheel is mounted to the number 8 counter weight on the crankshaft.

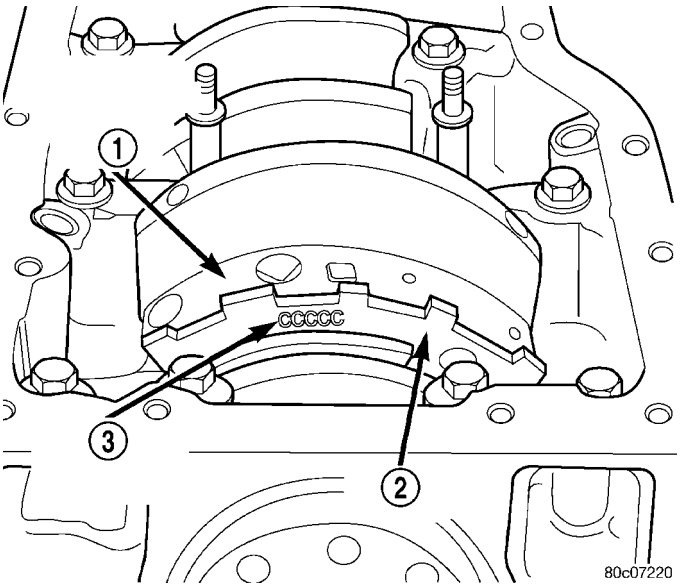

Fig. 62 Main Bearing Markings on Target Wheel

1 - REARMOST CRANKSHAFT COUNTER WEIGHT
2 - TARGET WHEEL
3 - MAIN BEARING SELECT FIT MARKINGS

NOTE: Service main bearings are coded. These codes identify what size (grade) the bearing is.

MAIN BEARING SELECTION CHART—4.7L

GRADE MARKING	SIZE mm (in.)	FOR USE WITH JOURNAL SIZE
A	0.008 mm U/S (0.0004 in.) U/S	63.488–63.496 mm (2.4996–2.4999 in.)
B	NOMINAL	63.496–63.504 mm (2.4999–2.5002 in.)
C	0.008 mm O/S (0.0004 in.) O/S	63.504–63.512 mm (2.5002–2.5005 in.)

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 63).

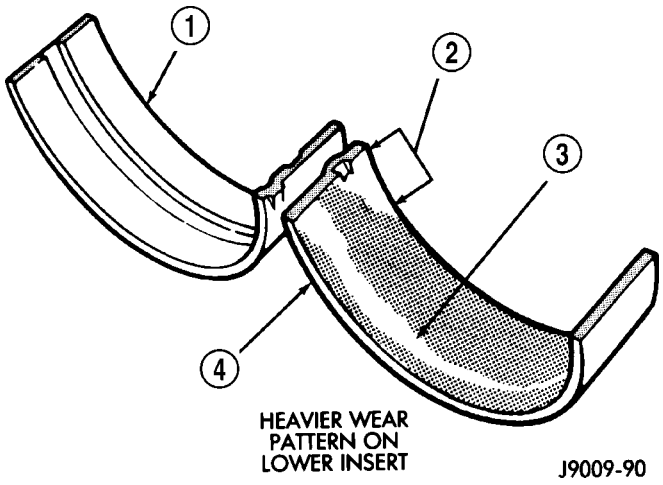

Fig. 63 Main Bearing Wear Patterns

1 - UPPER INSERT
2 - NO WEAR IN THIS AREA
3 - LOW AREA IN BEARING LINING
4 - LOWER INSERT

NOTE: If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Remove A/C compressor mouning fasteners and set aside.

(4) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Remove upper radiator hose.

(6) Disconnect electrical connector for fan mounted inside radiator shroud.

(7) Remove radiator shroud attaching fasteners.

NOTE: Transmission cooler line snaps into shroud lower right hand corner.

(8) Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(9) Remove crankshaft damper bolt.

CRANKSHAFT OIL SEAL - FRONT (Continued)

(10) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 64).

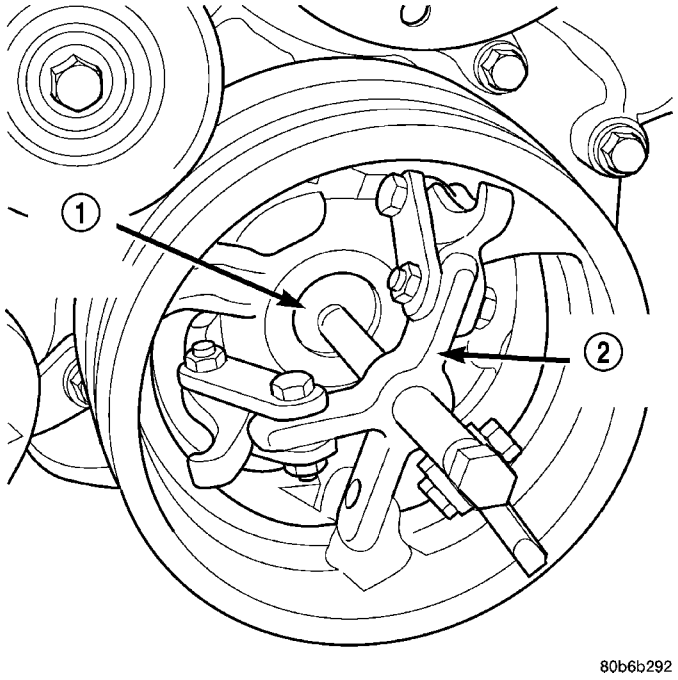

Fig. 64 Crankshaft Damper Removal

1 - SPECIAL TOOL 8513 INSERT
2 - SPECIAL TOOL 1026

(11) Using Special Tool 8511, remove crankshaft front seal (Fig. 65).

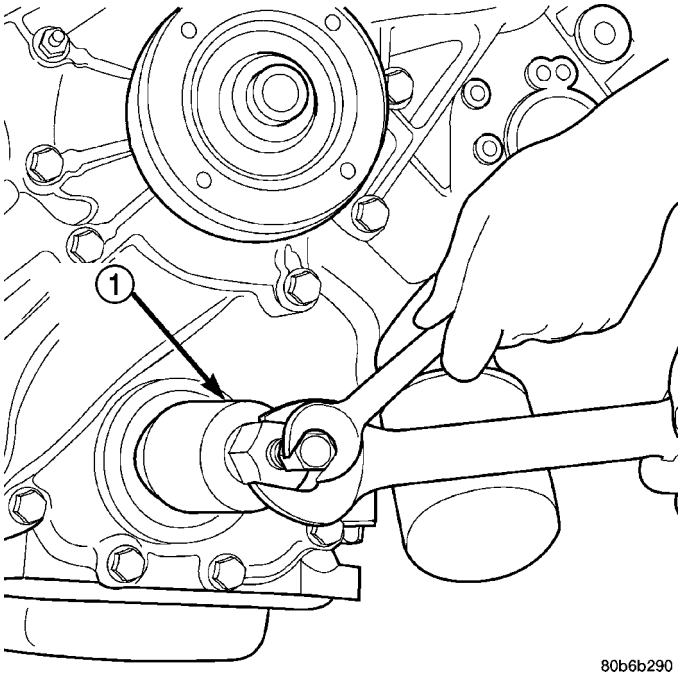

Fig. 65 Crankshaft Front Seal Removal

1 - SPECIAL TOOL 8511

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(1) Using Special Tool 8348 and 8512, install crankshaft front seal (Fig. 66).

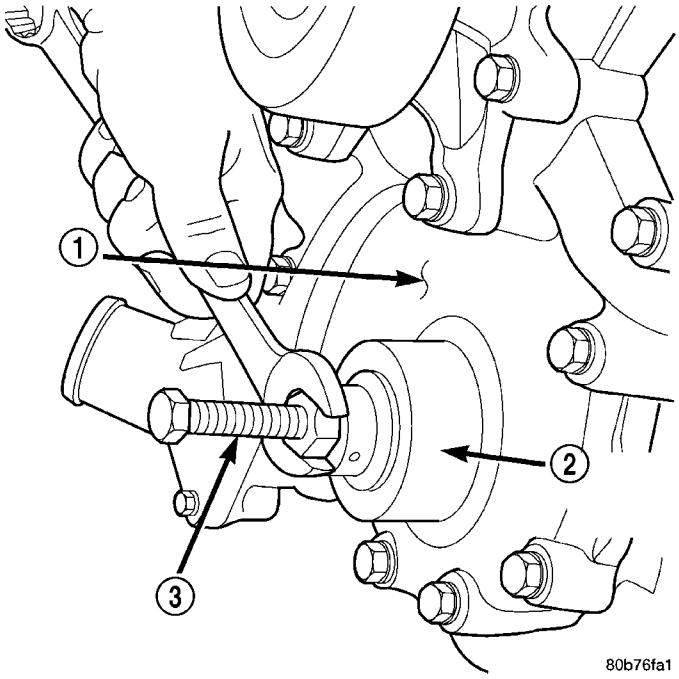

Fig. 66 Crankshaft Front Seal Installation

1 - TIMING CHAIN COVER
2 - SPECIAL TOOL 8348
3 - SPECIAL TOOL 8512

(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(3) Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(4) Install upper radiator hose.

(5) Install A/C compressor and tighten fasteners to 54 N·m (40 ft. lbs.).

(6) Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(7) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(8) Connect negative cable to battery.

CRANKSHAFT OIL SEAL - REAR

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.

(4) If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.

(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

REMOVAL

NOTE: This procedure can be performed in vehicle.

(1) If being preformed in vehicle, remove the transmission.

(2) Remove the flexplate (Refer to 9 - ENGINE/ ENGINE BLOCK/FLEX PLATE - REMOVAL).

NOTE: The crankshaft oil seal CAN NOT be reused after removal.

NOTE: The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.

(3) Using Special Tool 8506 (Fig. 67), remove the crankshaft rear oil seal.

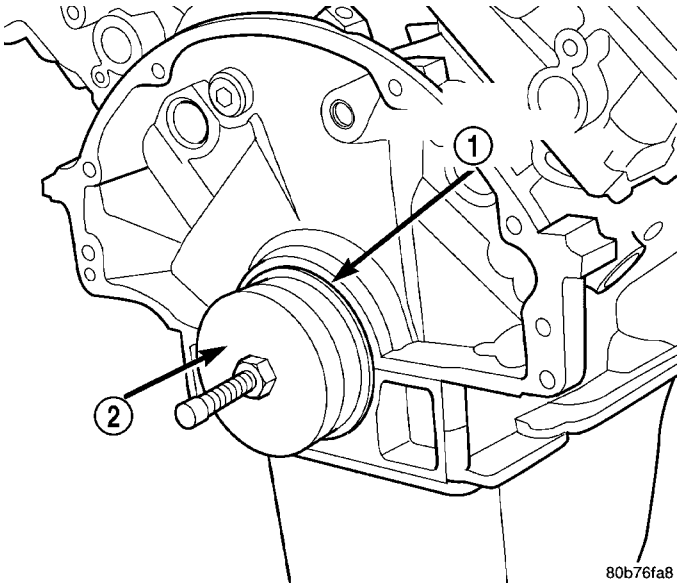

Fig. 67 Crankshaft Rear Oil Seal Removal

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8506

CRANKSHAFT OIL SEAL - REAR (Continued)

INSTALLATION

(1) Lubricate the crankshaft flange with engine oil.

(2) Position the magnetic seal guide Special Tool 8349-2 (Fig. 68) onto the crankshaft rear face. Then position the crankshaft rear oil seal onto the guide.

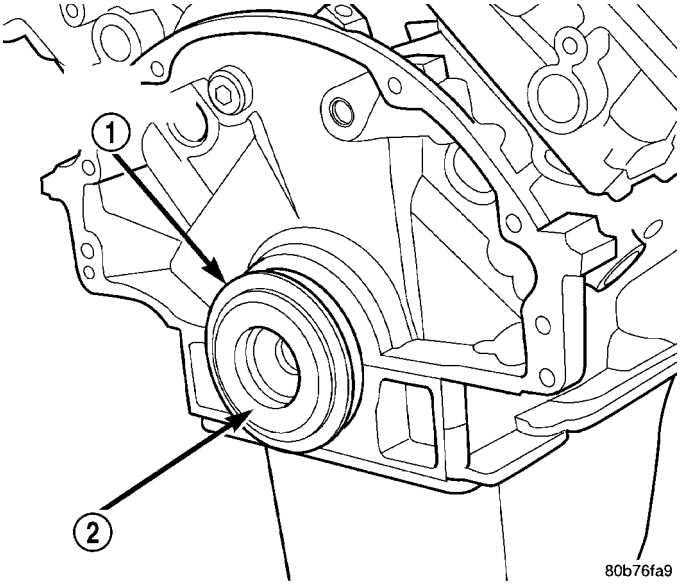

Fig. 68 Crankshaft Rear Oil Seal Guide Special Tool 8349-2 and Oil

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-2 GUIDE

(3) Using Special Tools 8349 Crankshaft Rear Oil Seal Installer and C-4171 Driver Handle (Fig. 69), with a hammer, tap the seal into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.

(4) Install the flexplate.

(5) Install the transmission.

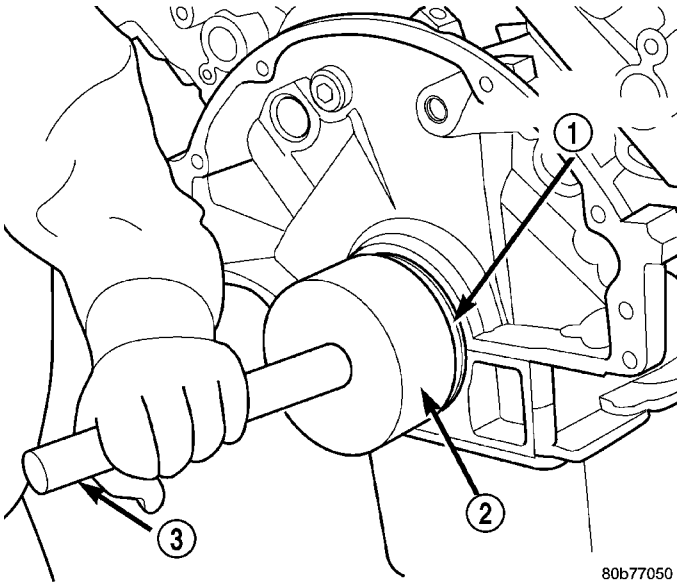

Fig. 69 Crankshaft Rear Oil Seal Installation

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-1 INSTALLER
3 - SPECIAL TOOL C-4171 HANDLE

FLEX PLATE

REMOVAL

(1) Remove the transmission.

(2) Remove the bolts and flexplate.

INSTALLATION

(1) Position the flexplate onto the crankshaft and install the bolts hand tight.

(2) Tighten the flexplate retaining bolts to 60 N·m (45 ft. lbs.) in the sequence shown (Fig. 70).

(3) Install the transmission.

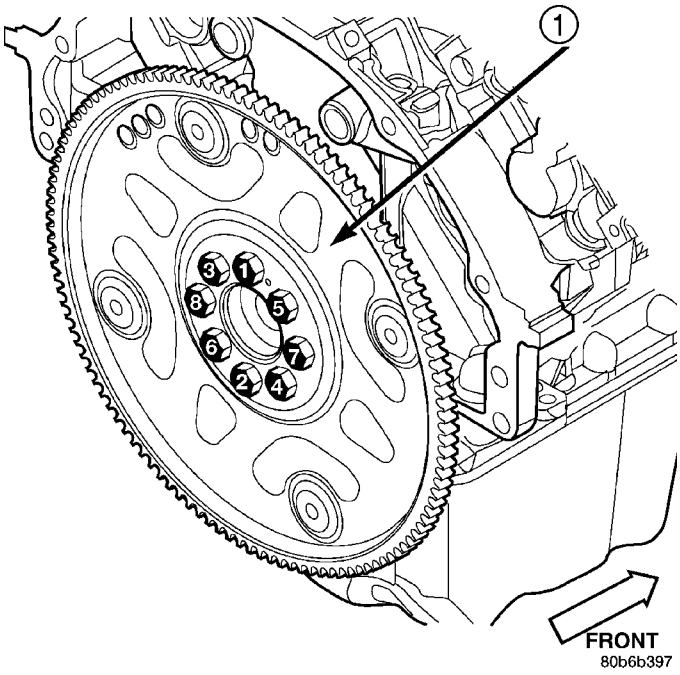

Fig. 70 Flexplate Tightening Sequence

1 - FLEXPLATE

PISTON & CONNECTING ROD

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. The anodized top ring groove and crown has been replaced with a coated top ring that is blue in color on the bottom surface. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The connecting rods are made of forged powdered metal, with a "fractured cap" design. A pressed fit piston pin is used to attach the piston and connecting rod.

STANDARD PROCEDURE - PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 72).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 71). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the following components:

- Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

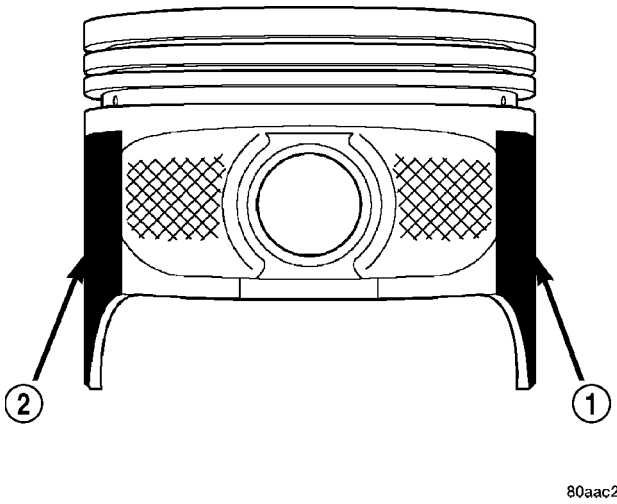

Fig. 71 DO NOT MEASURE MOLY COATED PISTON

- Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pis-**

PISTON & CONNECTING ROD (Continued)

tons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

(4) Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool (Fig. 73).

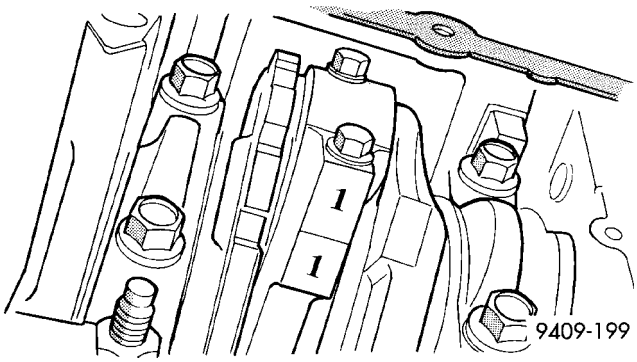

Fig. 73 Identify Connecting Rod to Cylinder Position—Typical

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

(5) Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur

(6) Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

(7) Carefully remove piston rings from piston(s), starting from the top ring down.

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

(1) Using a suitable cleaning solvent clean the pistons in warm water and towel dry.

(2) Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Before installing piston and connecting rod assemblies into the bore, install the piston rings.

(2) Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**

(3) Position bearing onto connecting rod. Ensure that hole in bearing shell aligns with hole in connecting rod. Lubricate bearing surface with clean engine oil.

PISTON & CONNECTING ROD (Continued)

(4) Install Special Tool 8507 Connecting Rod Guides into connecting rod bolt threads (Fig. 74).

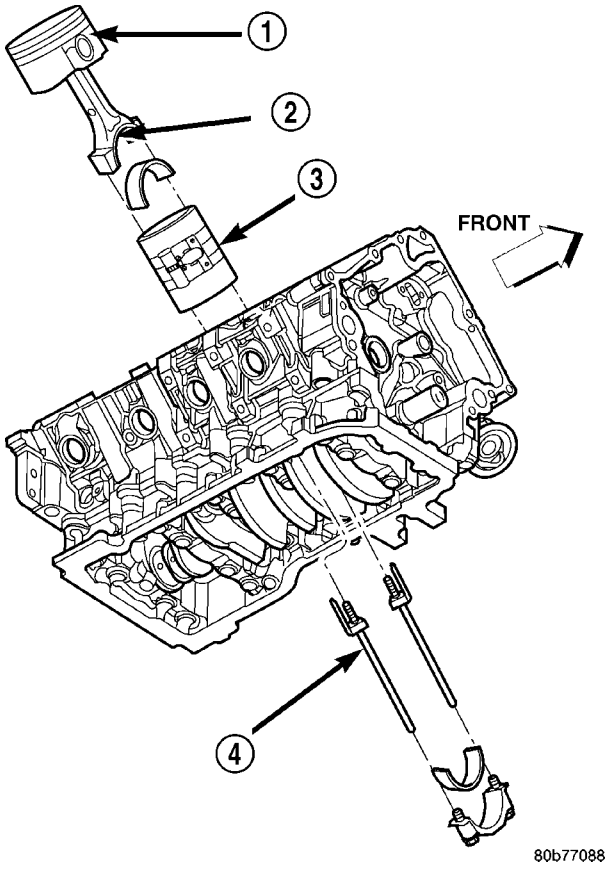

Fig. 74 PISTON AND CONNECTING ROD INSTALLATION

1 - "F" TOWARD FRONT OF ENGINE
2 - OIL SLINGER SLOT
3 - RING COMPRESSOR
4 - SPECIAL TOOL 8507

(5) The pistons are marked on the piston pin bore surface with an raised "F" indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks. The connecting rod oil slinger slot faces the front of the engine (Fig. 75).

(6) Wipe cylinder bore clean and lubricate with engine oil.

(7) Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.

(8) Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

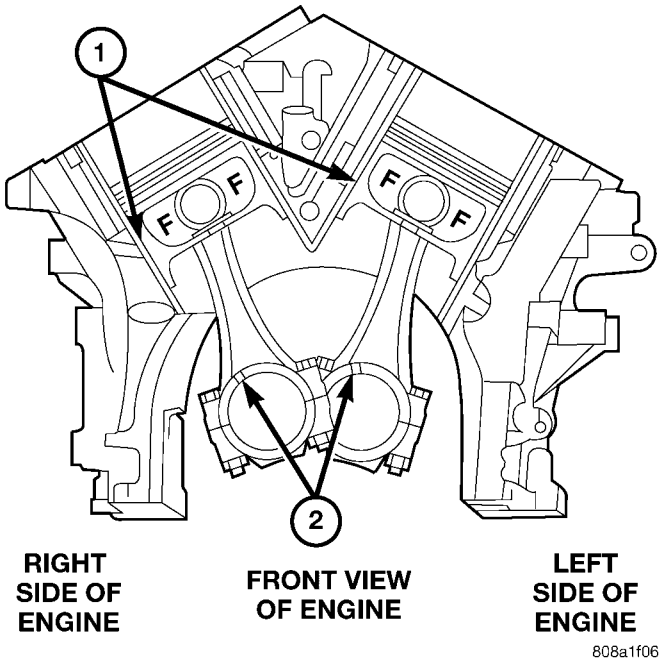

Fig. 75 PISTON AND CONNECTING ROD ORIENTATION

1 - MAJOR THRUST SIDE OF PISTON
2 - OIL SLINGER SLOT

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

(9) Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) plus 90°.

(10) Install the following components:

- Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- Timing chain and cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Fill crankcase with proper engine oil to correct level.

(12) Connect negative cable to battery.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

(1) Wipe the cylinder bore clean.

(2) Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.

(3) Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.

(4) Using a feeler gauge check the ring end gap (Fig. 76). Replace any rings not within specification.

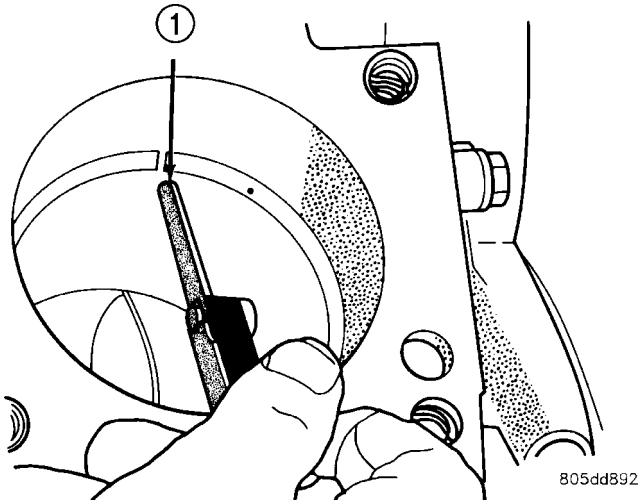

Fig. 76 Ring End Gap Measurement - Typical

1 - FEELER GAUGE

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

(5) Measure the ring side clearance as shown (Fig. 77) make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.

(6) Rotate the ring around the piston, the ring must rotate in the groove with out binding.

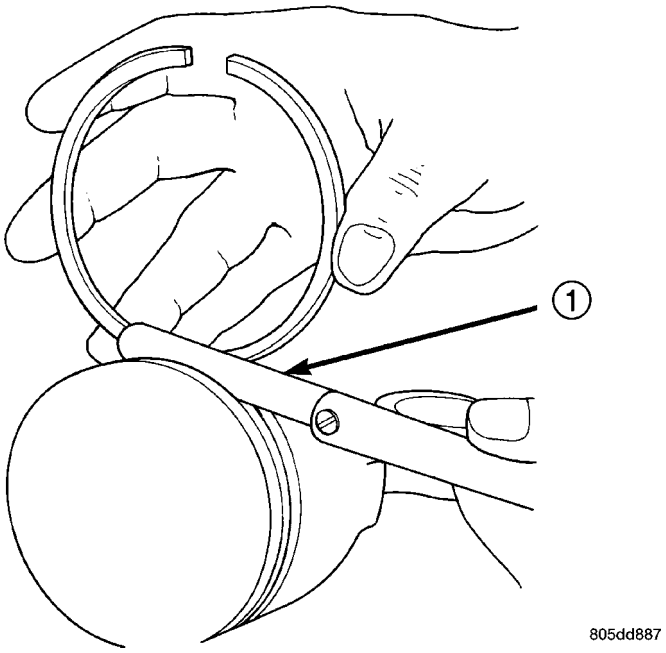

Fig. 77 Measuring Piston Ring Side Clearance

1 - FEELER GAUGE

PISTON RING SPECIFICATION CHART

Ring Position	Groove Clearance	Maximum Clearance
Upper Ring	.051-.094 mm (0.0020-.0037 in.)	0.11 mm (0.004 in.)
Intermediate Ring	0.04-0.08 mm (0.0016-0.0031 in.)	0.10 mm (0.004 in.)
Oil Control Ring (Steel Rails)	.019-.229 mm (.0007-.0090 in.)	.25 mm (0.010 in.)
Ring Position	**Ring Gap**	**Wear Limit**
Upper Ring	0.20-0.36 mm (0.0079-0.0142 in.)	0.43 mm (0.0017 in.)
Intermediate Ring	0.37-0.63 mm (0.0146-0.0249 in.)	0.74 mm (0.029 in.)
Oil Control Ring (Steel Rail)	0.025-0.76 mm (0.0099- 0.03 in.)	1.55 mm (0.061 in.)

PISTON RINGS (Continued)

(7) The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

- **Oil ring expander.**
- **Upper oil ring side rail.**
- **Lower oil ring side rail.**
- **No. 2 Intermediate piston ring.**
- **No. 1 Upper piston ring.**

(8) Install the oil ring expander.

(9) Install upper side rail (Fig. 78) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

(10) Install No. 2 intermediate piston ring using a piston ring installer (Fig. 79).

(11) Install No. 1 upper piston ring using a piston ring installer (Fig. 79).

(12) Position piston ring end gaps as shown in (Fig. 80). It is important that expander ring gap is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.

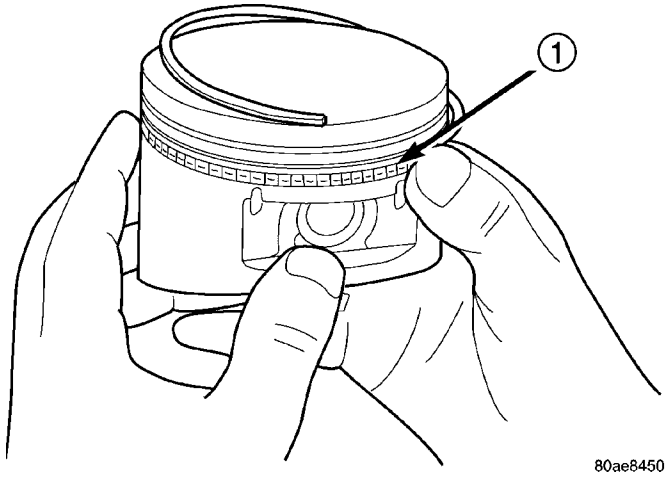

Fig. 78 Side Rail - Installation

1 - SIDE RAIL END

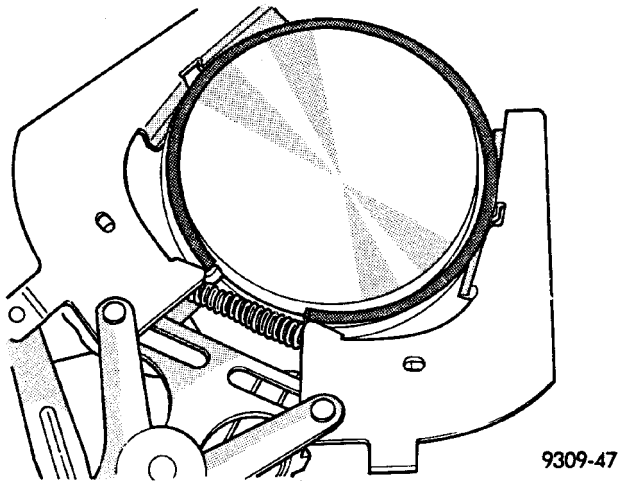

Fig. 79 Upper and Intermediate Rings - Installation

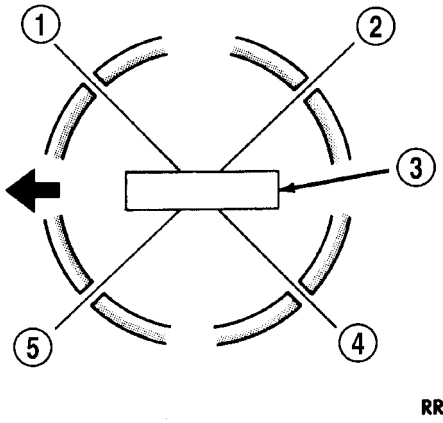

Fig. 80 Piston Ring End Gap Position

1 - SIDE RAIL UPPER

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative cable from battery.
(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(4) Remove radiator upper hose.
(5) Remove upper fan shroud.
(6) Using Special Tools 6958 Spanner with Adapter Pins 8346, loosen fan and viscous assembly from water pump (Fig. 81).
(7) Remove fan and viscous assembly.

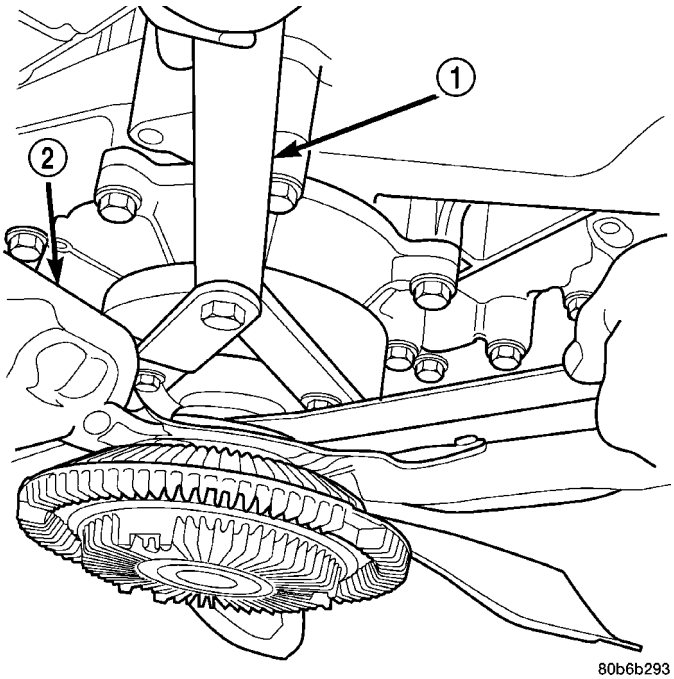

Fig. 81 FAN ASSEMBLY - REMOVAL/ASSEMBLY

1 - SPECIAL TOOL 6958 SPANNER WRENCH WITH ADAPTER PINS 8346
2 - FAN

(8) Disconnect electrical connector for fan mounted inside radiator shroud.

NOTE: Transmission cooler line snaps into shroud lower right hand corner.

(9) Remove crankshaft damper bolt.
(10) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 82).

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512–A, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

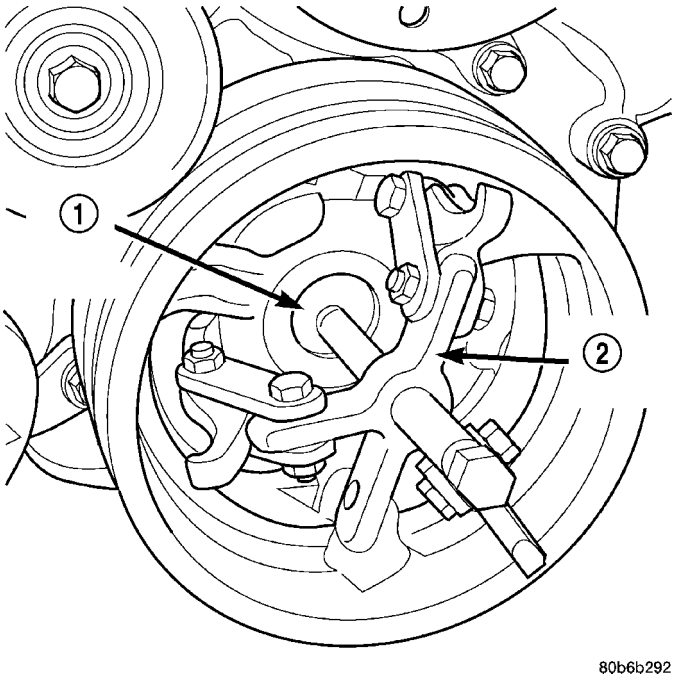

Fig. 82 CRANKSHAFT DAMPER - REMOVAL

1 - SPECIAL TOOL 8513 INSERT
2 - SPECIAL TOOL 1026

(1) Align crankshaft damper slot with key in crankshaft. Slide damper onto crankshaft slightly.

CAUTION: Special Tool 8512–A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

(2) Assemble Special Tool 8512–A as follows, The nut is threaded onto the shaft first. Then the roller bearing is placed onto the threaded rod (The hardened bearing surface of the bearing **MUST**face the nut). Then the hardened washer slides onto the threaded rod (Fig. 83). Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or equivalent.
(3) Using Special Tool 8512–A, press damper onto crankshaft (Fig. 84).
(4) Install then tighten crankshaft damper bolt to 175 N·m (130 ft. lbs.).
(5) Install fan blade assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
(6) Install radiator upper shroud and tighten fasteners to 11 N·m (95 in. lbs.).
(7) Connect electrical connector for shroud fan.
(8) Install radiator upper hose.

VIBRATION DAMPER (Continued)

5 - HARDENED WASHER

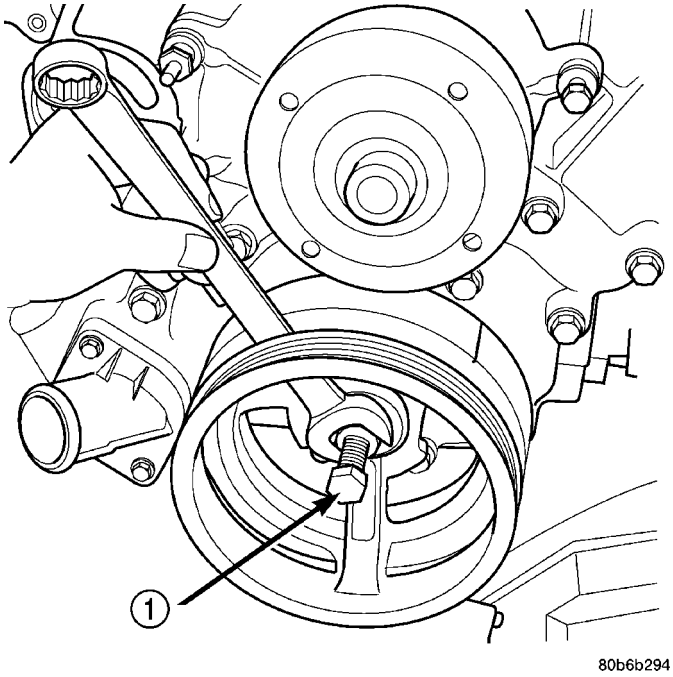

Fig. 84 Crankshaft Damper Installation

1 - SPECIAL TOOL 8512

(9) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(10) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(11) Connect negative cable to battery.

STRUCTURAL COVER

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine bedplate.

OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove the left hand exhaust pipe from exhaust manifold.

(3) Loosen the right hand exhaust manifold-to-exhaust pipe retaining bolts.

(4) Remove the eight bolts retaining structural cover (Fig. 85) in the sequence shown.

(5) Pivot the exhaust pipe downward and remove the structural cover.

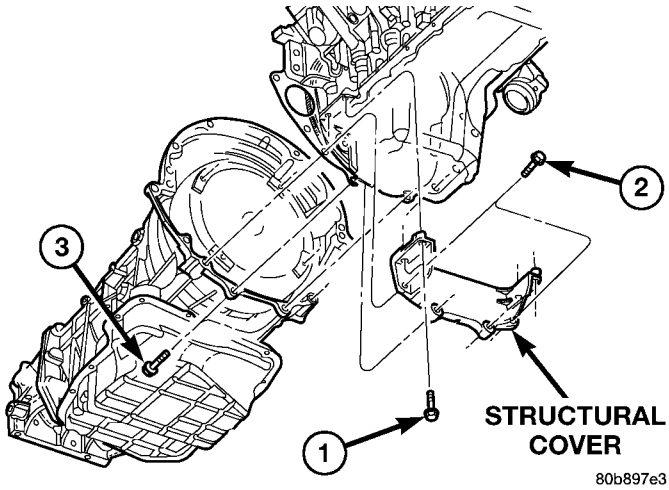

Fig. 85 Structural Cover

1 - BOLT
2 - BOLT
3 - BOLT

INSTALLATION

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.

(1) Position the structural cover in the vehicle.

(2) Install all four bolts retaining the cover-to-engine. DO NOT tighten the bolts at this time.

(3) Install the four cover-to-transmission bolts. Do NOT tighten at this time.

STRUCTURAL COVER (Continued)

CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.

(4) Starting with the two rear cover-to-engine bolts, tighten bolts (1) (Fig. 86) to 54 N·m (40 ft. lbs.), then tighten bolts (2) (Fig. 86) and (3) to 54 N·m (40 ft. lbs.) in the sequence shown.

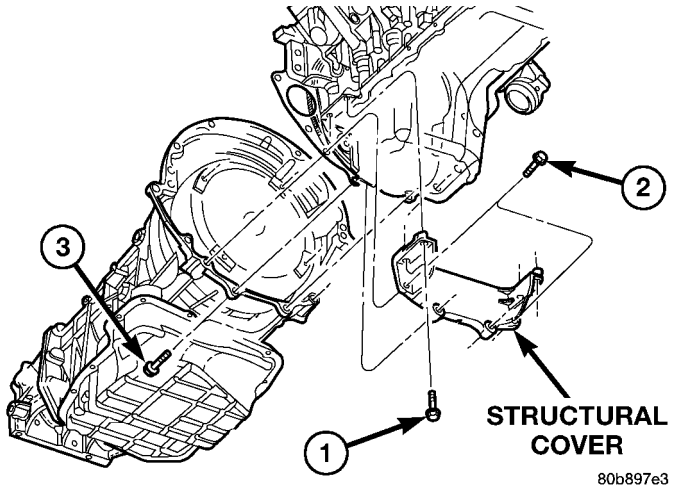

Fig. 86 Structural Cover

1 - BOLT
2 - BOLT
3 - BOLT

(5) Install the exhaust pipe on left hand exhaust manifold.

(6) Tighten exhaust manifold-to-exhaust pipe retaining bolts to 20–26 N·m (15–20 ft. lbs.).

FRONT MOUNT

REMOVAL

2WD

(1) Disconnect the negative cable from the battery.

CAUTION: Remove the viscous fan before raising engine. Failure to do so may cause damage to the fan blade, fan clutch and fan shroud.

(2) Remove the viscous fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

(3) Raise the vehicle.

(4) Remove the engine oil filter.

(5) Remove the oil drain trough.

(6) Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.

(7) Support the front axle with a suitable jack.

(8) Remove the (4) bolts that attach the engine mounts to the front axle.

(9) Remove the (3) bolts that attach the front axle to the left engine bracket.

(10) Lower the front axle.

(11) Remove the through bolts

(12) Raise the engine far enough to be able to remove the left and right engine mounts.

(13) Remove the (8) mount to engine attaching bolts

(14) Remove the engine mounts.

4WD

(1) Disconnect the negative cable from the battery.

(2) Remove the viscous fan.

(3) Raise the vehicle.

(4) Remove the skid plate.

(5) Remove the front crossmember.

(6) Remove the engine oil filter.

(7) Remove the oil drain trough.

(8) Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.

(9) Support the front axle with a suitable jack.

(10) Remove the (4) bolts that attach the engine mounts to the front axle (Fig. 87).

(11) Remove the (3) bolts that attach the front axle to the left engine bracket.

(12) Lower the front axle.

(13) Remove the (6) through bolts

FRONT MOUNT (Continued)

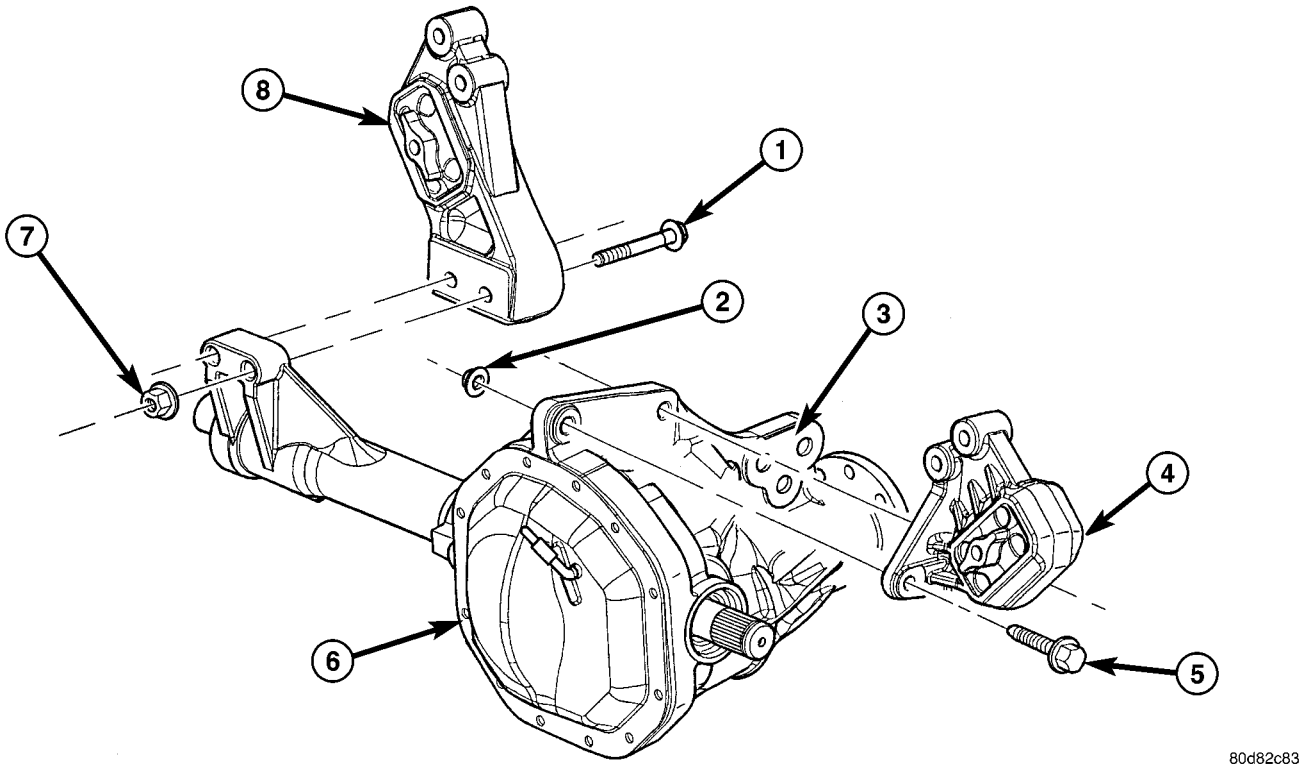

Fig. 87 ENGINE INSULATOR MOUNTS 4X4

1 - RH INSULATOR TO AXLE BOLT
2 - NUT
3 - PINION SUPPORT MOUNT
4 - LH INSULATOR MOUNT
5 - LH INSULATOR TO AXLE BOLT
6 - FRONT AXLE
7 - NUT
8 - RH INSULATOR MOUNT

(14) Raise the engine far enough to be able to remove the left (Fig. 89) and right (Fig. 88) engine mounts.

(15) Remove the engine mounts.

INSTALLATION

2WD

NOTE: For mount to engine block and left engine bracket to front axle bolts, apply Mopar® Lock and Seal Adhesive, Medium Strength Threadlocker.

(1) Install the right and left side engine mounts to the engine block with (8) bolts. Torque bolts to 54 N·m (40 ft. lbs.).

(2) Insert the (2) through bolts into the right and left side engine mounts and loose assemble the two nuts onto the through bolts.

(3) Lower the engine until the through bolts rest onto the slots in the frame brackets.

(4) Tighten the through bolt nuts to 94 N·m (70 ft. lbs.).

(5) Install the oil drain trough.

(6) Install the engine oil filter.

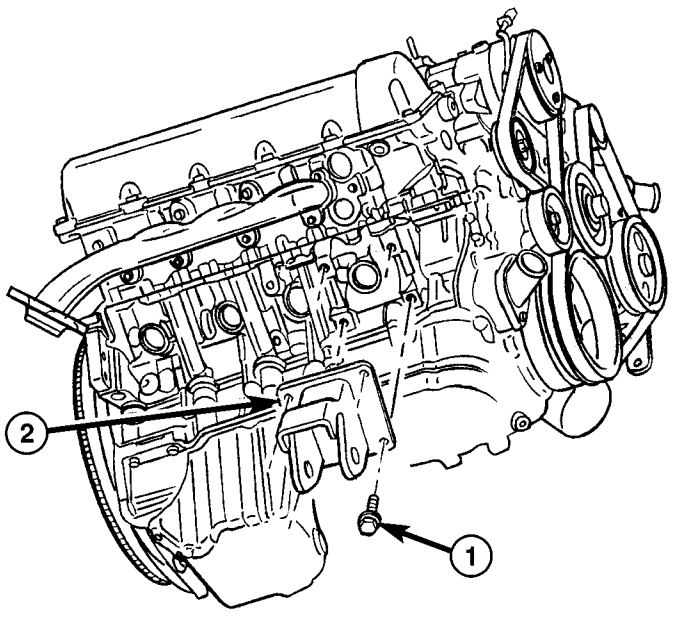

Fig. 88 ENGINE MOUNT SUPPORT BRACKET RH

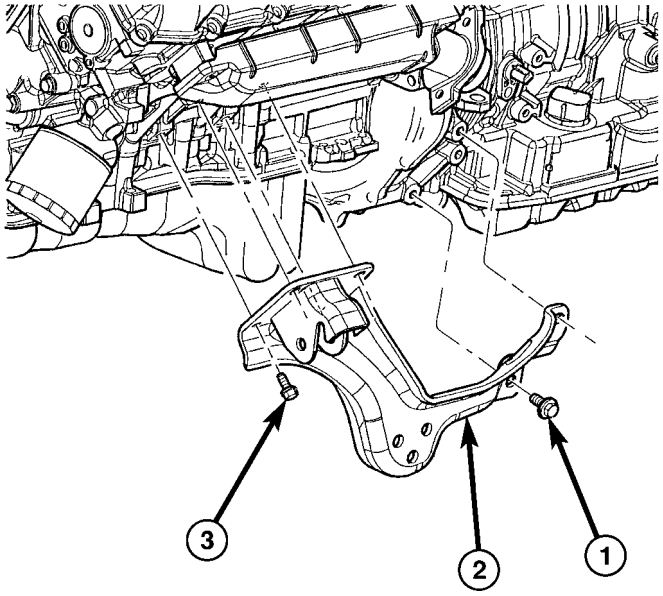
FRONT MOUNT (Continued)



80d82fc4

Fig. 89 ENGINE MOUNT SUPPORT BRACKET

1 - BOLT
2 - ENGINE MOUNT SUPPORT BRACKET
3 - BOLT

(7) Lower the vehicle.

(8) Install the viscous fan (Refer to 7 - COOLING/ ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

(9) Reconnect the negative battery cable.

4WD

NOTE: For mount to engine block and left engine bracket to front axle bolts, apply Mopar® Lock and Seal Adhesive, Medium Strength Threadlocker.

(1) Install the right and left side engine mounts to the front axle. Torque nuts to 94 N·m (70 ft. lbs.).

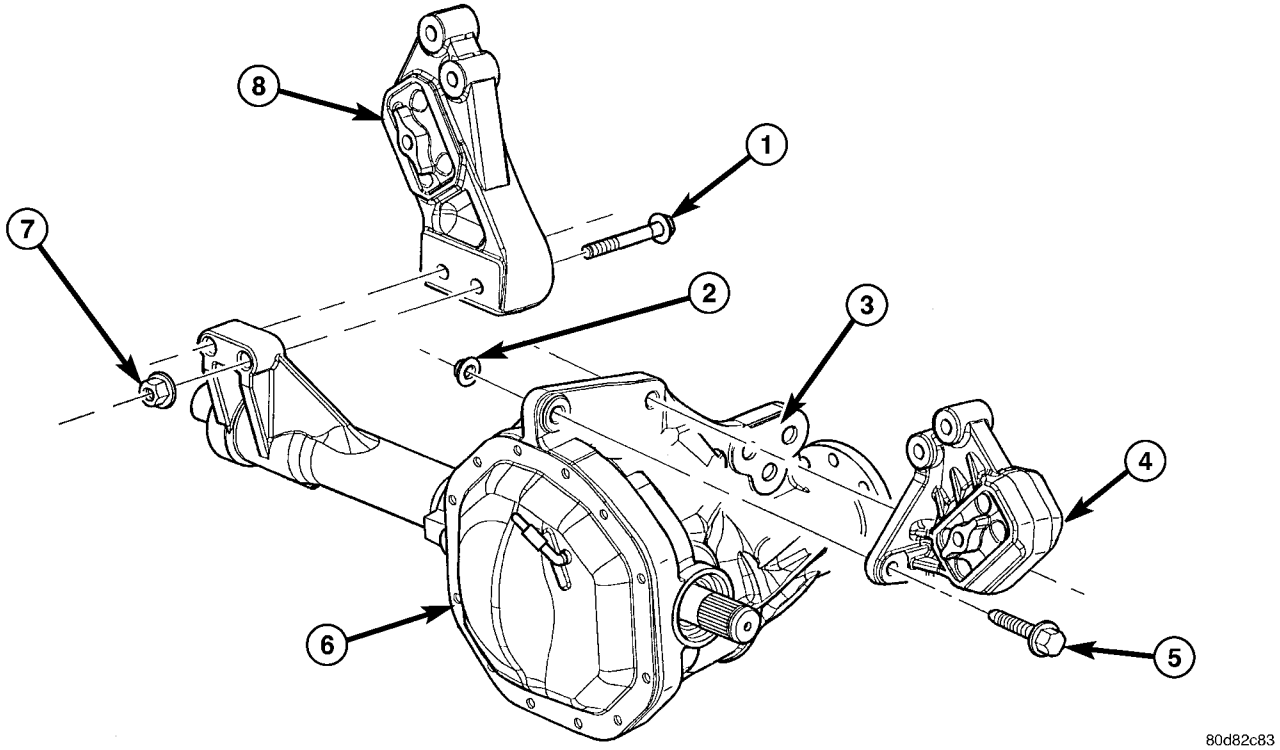
(2) Raise the front axle into the frame and install the left and right side through bolts. Torque nuts to 94 N·m (70 ft. lbs.).

(3) Insert the two upper through bolts into the right and left side engine mounts and loose assemble the two nuts onto the through bolts.

(4) Lower the engine until the left and right side engine brackets rest on the through bolts, and the lower engine bracket through holes align with the engine mounts, and the left engine bracket holes align with the front axle slots (Fig. 90).

(5) Loose assemble the (3) bolts that attach the front axle to the left engine bracket.

(6) Loose assemble the lower through bolts.



80d82c83

Fig. 90 ENGINE INSULATOR MOUNTS 4X4

7 - NUT
8 - RH INSULATOR MOUNT

FRONT MOUNT (Continued)

(7) Torque the nuts for the (4) through bolts to 101 N·m (75 ft. lbs.).

(8) Torque the (3) bolts that attach the front axle to the left engine bracket to 101 N·m (75 ft. lbs.).

(9) Install the oil drain trough.

(10) Install the engine oil filter.

(11) Install the front crossmember.

(12) Install the skid plate.

(13) Lower the vehicle.

(14) Install the viscous fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

(15) Reconnect the negative battery cable.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Using a suitable jack, support transmission.

(3) Remove the nuts from the transmission mount (Fig. 91).

(4) Remove the two bolts that attach the transmission mount to the engine bracket.

(5) Raise the transmission enough to remove the mount from the crossmember.

(6) Remove the mount.

INSTALLATION

NOTE: Threadlocking compound must be applied to the bolts before installation.

(1) Install the two bolts that attach the transmission mount to the transmission bracket.

(2) Torque the bolts to 61N·m (45 ft.lbs.) torque.

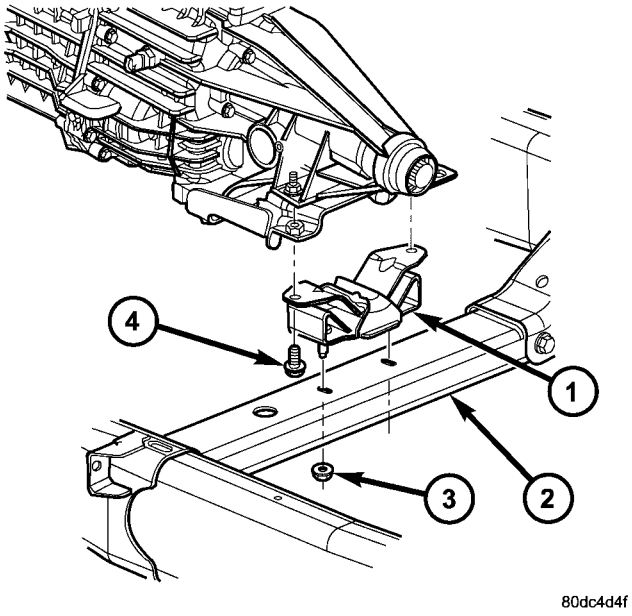

Fig. 91 TRANSMISSION MOUNT

1 - MOUNT
2 - CROSSMEMBER
3 - NUT
4 - BOLT

(3) Lower the transmission so the transmission mount rests on the crossmember, and the studs of the transmission mount are aligned in the slots in the crossmember.

(4) Install the nuts onto the transmission mount studs through the crossmember access slot.

(5) Torque the nuts to 54N·m (40 ft. lbs.).

LUBRICATION

DESCRIPTION

The lubrication system (Fig. 92) is a full flow filtration pressure feed type.

OPERATION

Oil from the oil pan is pumped by a gerotor type oil pump directly mounted to the crankshaft nose. Oil pressure is controlled by a relief valve mounted inside the oil pump housing. For lubrication flow refer to (Fig. 92).

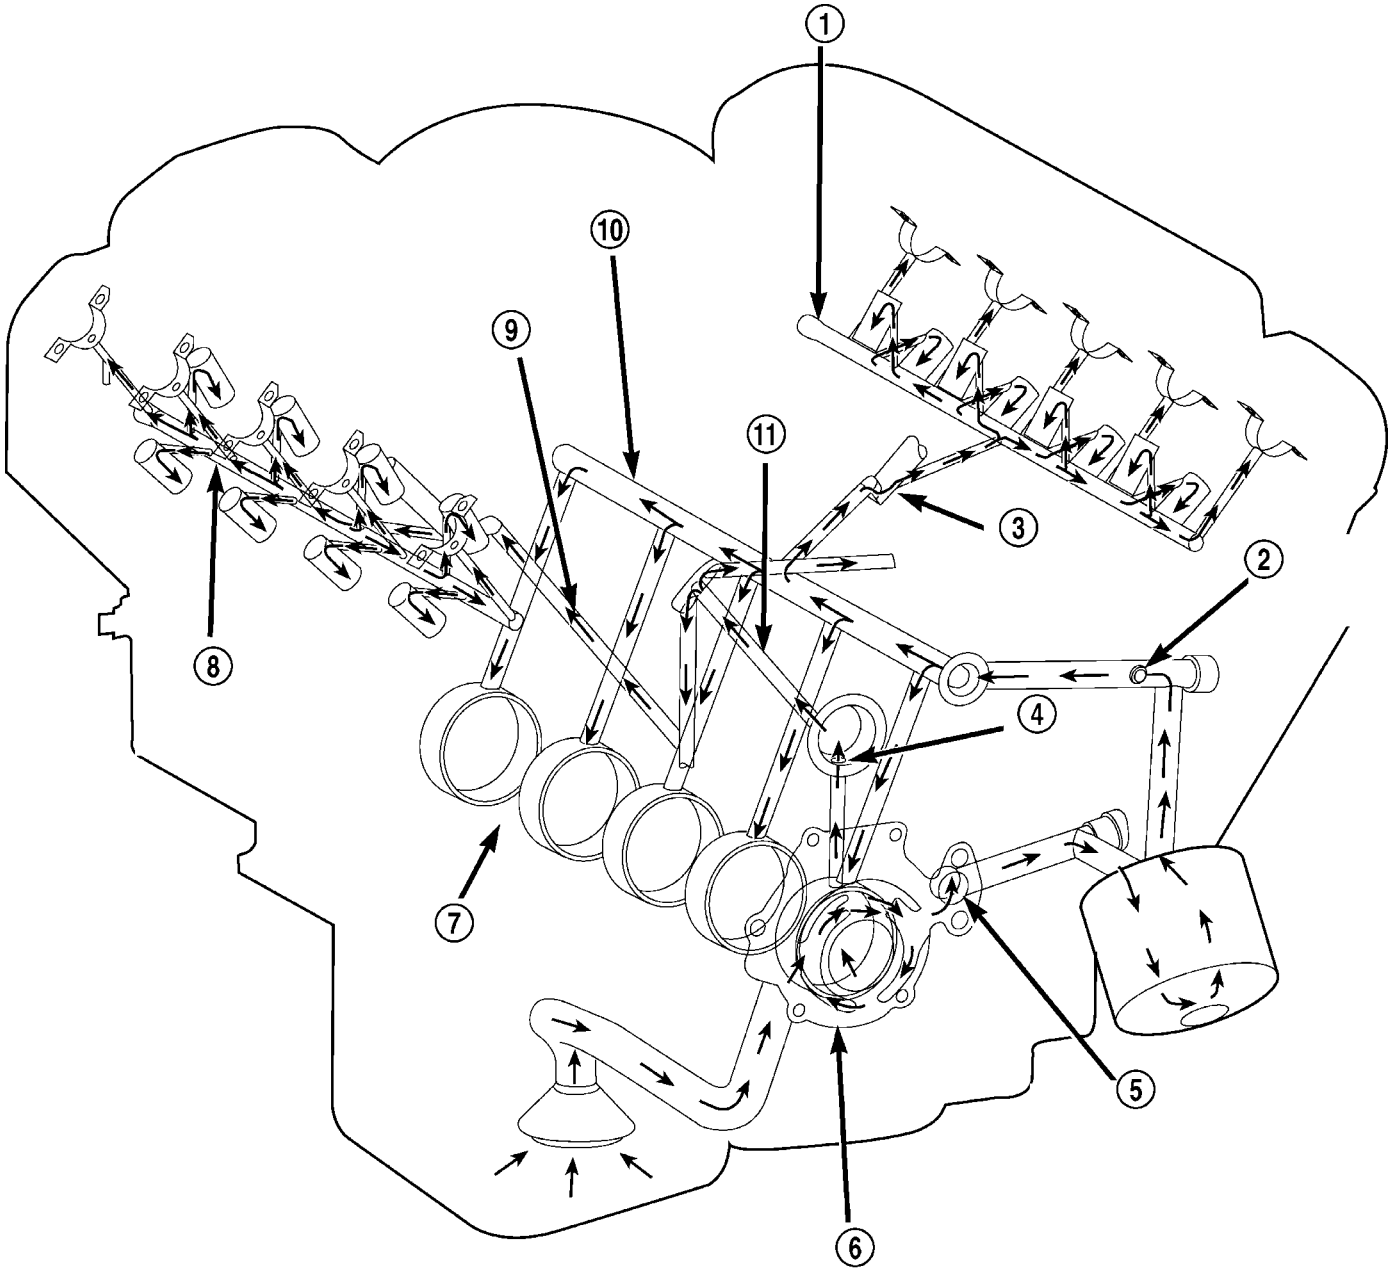

Fig. 92 Engine Oil Lubrication System

1 - LEFT CYLINDER HEAD OIL GALLERY

8 - RIGHT CYLINDER HEAD OIL GALLERY
9 - TO RIGHT CYLINDER HEAD
10 - CYLINDER BLOCK MAIN GALLERY
11 - OIL FEED TO BOTH SECONDARY TENSIONERS

LUBRICATION (Continued)

The camshaft exhaust valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Due to the orentation of the rocker arm, the camshaft intake lobes are not lubed in the same manner as the exhaust lobes. The intake lobes are lubed through internal passages in the camshaft. Oil flows through a bore in the number 3 camshaft bearing bore, and as the camshaft turns, a hole in the camshaft aligns with the hole in the camshaft bore allowing engine oil to enter the camshaft tube. The oil then exits through 1.6mm (0.063 in.) holes drilled into the intake lobes, lubricating the lobes and the rocker arms.

LUBRICATION (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit (Fig. 93)and install gauge assembly C-3292.

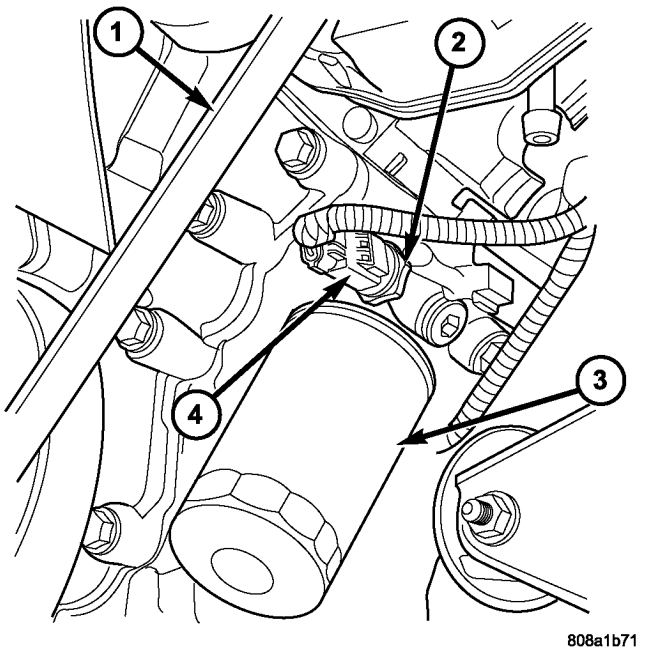

Fig. 93 OIL PRESSURE SENDING UNIT -TYPICAL

1 - BELT
2 - OIL PRESSURE SENSOR
3 - OIL FILTER
4 - ELEC. CONNECTOR

(2) Run engine until thermostat opens.
(3) Oil Pressure:
- Curb Idle - 25 kPa (4 psi) minimum
- 3000 rpm - 170 - 758 kPa (25 - 110 psi)

(4) If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.If the oil leak source is not positively identified at this time, proceed with the air leak detection test method.

Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(5) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.
(2) Raise the vehicle.
(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal,

LUBRICATION (Continued)

camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

OIL

STANDARD PROCEDURE - ENGINE OIL SERVICE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30 in the 3.7L engines. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 94).

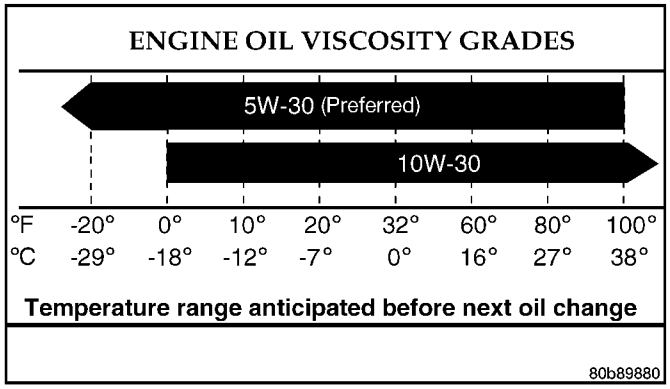

Fig. 94 TEMPERATURE/ENGINE OIL VISCOSITY - 3.7L ENGINE

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 95).

9400-9

Fig. 95 Engine Oil Container Standard Notations

OIL (Continued)

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located at the right rear of the engine on the 3.7L engines. (Fig. 96).

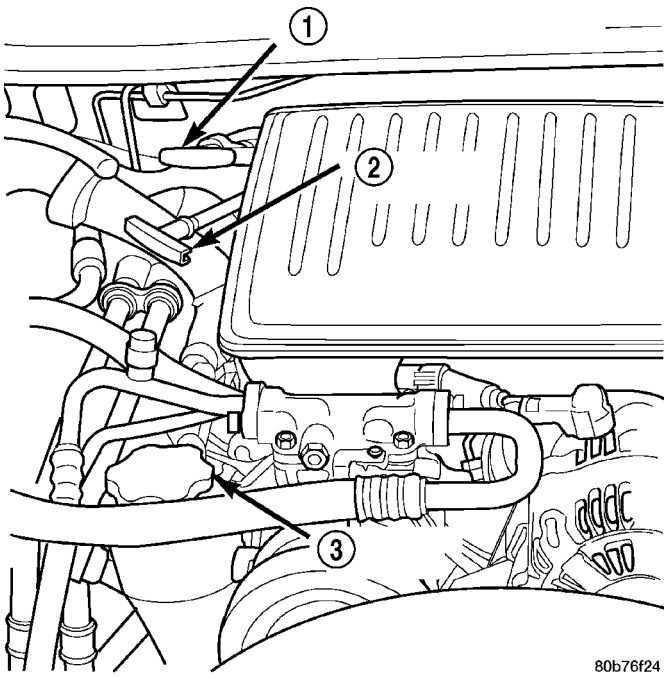

Fig. 96 ENGINE OIL DIPSTICK 3.7L ENGINE

1 - TRANSMISSION DIPSTICK
2 - ENGINE OIL DIPSTICK
3 - ENGINE OIL FILL CAP

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

(1) Position vehicle on level surface.
(2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
(3) Wipe dipstick clean.
(4) Install dipstick and verify it is seated in the tube.
(5) Remove dipstick, with handle held above the tip, take oil level reading.
(6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.
(2) Hoist and support vehicle on safety stands.
(3) Remove oil fill cap.
(4) Place a suitable drain pan under crankcase drain.
(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
(6) Install drain plug in crankcase.
(7) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.
(8) Install oil fill cap.
(9) Start engine and inspect for leaks.
(10) Stop engine and inspect oil level.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.
(2) Using a suitable oil filter wrench loosen filter.
(3) Rotate the oil filter counterclockwise (Fig. 97)to remove it from the cylinder block oil filter boss.

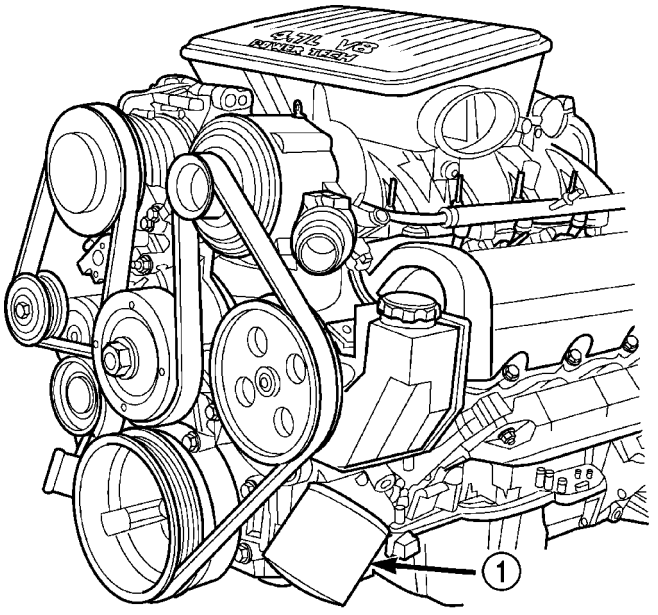

Fig. 97 Oil Filter - 4.7L Engine

1 - ENGINE OIL FILTER

OIL FILTER (Continued)

(4) When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: Make sure filter gasket was removed with filter.

(5) With a wiping cloth, clean the gasket sealing surface of oil and grime.

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 98) hand tighten filter one full turn, do not over tighten.

(3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

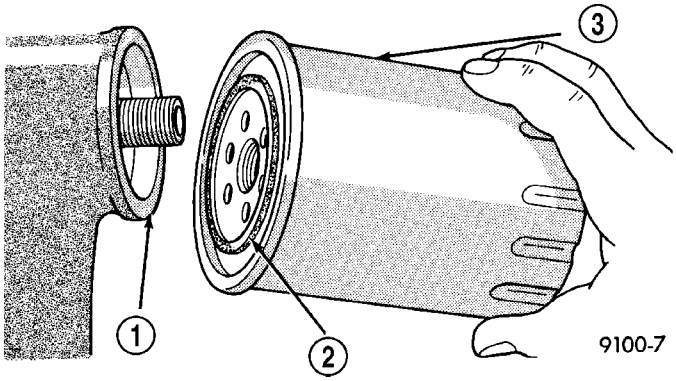

Fig. 98 Oil Filter Sealing Surface-Typical

1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

OIL PAN

REMOVAL

(1) Disconnect the negative battery cable.

(2) Install engine support fixture special tool # 8534. **Do not raise engine at this time.**

(3) Loosen both left and right side engine mount through bolts. Do not remove bolts.

(4)

(5) Remove the structural dust cover, if equipped.

(6) Drain engine oil.

(7) Remove the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - REMOVAL).

CAUTION: Only raise the engine enough to provide clearance for oil pan removal. Check for proper clearance at fan shroud to fan and cowl to intake manifold.

(8) Raise engine using special tool # 8534 to provide clearance to remove oil pan.

NOTE: Do not pry on oil pan or oil pan gasket. Gasket is integral to engine windage tray and does not come out with oil pan.

(9) Remove the oil pan mounting bolts and oil pan.

(10) Unbolt oil pump pickup tube and remove tube.

(11) Inspect the integral windage tray and gasket and replace as needed.

INSTALLATION

(1) Clean the oil pan gasket mating surface of the bedplate and oil pan.

(2) Position the oil pan gasket and pickup tube with new o-ring. Install the mounting bolt and nuts. Tighten bolt and nuts to 28 N·m (20 ft. lbs.).

(3) Position the oil pan and install the mounting bolts. Tighten the mounting bolts to 15 N·m (11 ft. lbs.) in the sequence shown (Fig. 99).

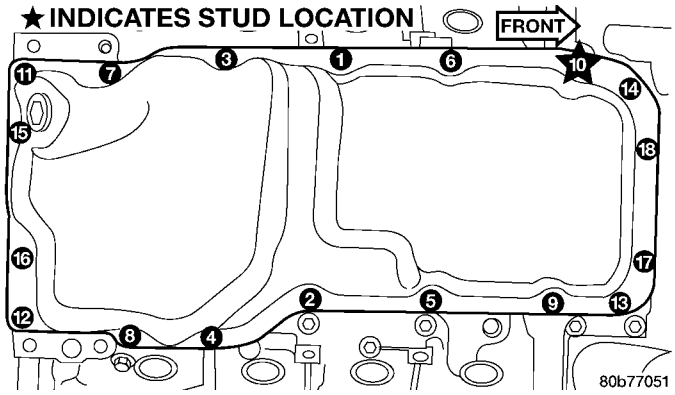

Fig. 99 Oil Pan Mounting Bolts and Oil Pan

(4) Lower the engine into mounts using special tool # 8534.

(5) Install both the left and right side engine mount through bolts. Tighten the nuts to 68 N·m (50 ft. lbs.).

(6) Remove special tool # 8534.

(7) Install structural dust cover, if equipped.

(8) Install the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - INSTALLATION).

(9) Fill engine oil.

(10) Reconnect the negative battery cable.

(11) Start engine and check for leaks.

OIL PRESSURE SENSOR/ SWITCH

DESCRIPTION

DESCRIPTION

The 3 wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

DESCRIPTION

The 3–wire, electrical/mechanical engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

OPERATION

OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5 volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3 wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5 volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

OPERATION

The oil pressure sensor uses two circuits. They are:

- A signal to the PCM relating to engine oil pressure
- A sensor ground through the PCM's sensor return

The oil pressure sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on a CCD bus circuit to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Raise vehicle on hoist.
(3) Remove front splash shield.
(4) Disconnect oil pressure sender wire (Fig. 100).
(5) Remove the pressure sender (Fig. 100).

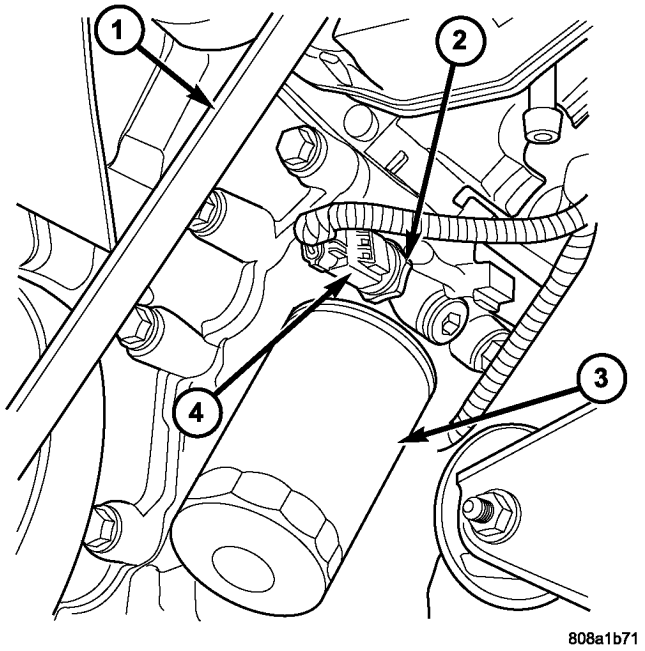

Fig. 100 OIL PRESSURE SENDING UNIT

1 - BELT
2 - OIL PRESSURE SENSOR
3 - OIL FILTER
4 - ELEC. CONNECTOR

INSTALLATION

(1) Install oil pressure sender.
(2) Connect oil pressure sender wire.
(3) Install front splash shield.
(4) Lower vehicle.
(5) Connect the negative battery cable.

OIL PUMP

REMOVAL

(1) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(2) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(3) Remove the timing chains and tensioners (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(4) Remove the four bolts, primary timing chain tensioner and the oil pump.

OIL PUMP (Continued)

DISASSEMBLY

(1) Remove oil pump cover screws and lift off cover plate.

(2) Remove pump inner and outer rotors.

NOTE: Once the oil pressure relief valve, cup plug, and pin are removed, the pump assembly must be replaced.

(3) If it is necessary to remove the pressure relief valve, drive the roll pin from pump housing and remove cup plug, spring and valve.

CLEANING

(1) Wash all parts in a suitable solvent.

INSPECTION

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

(1) Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.

(2) Lay a straight edge across the pump cover surface (Fig. 101). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between the cover and the straight edge the oil pump assembly should be replaced.

(3) Measure the thickness of the outer rotor (Fig. 102). If the outer rotor thickness measures at 12.005 mm (0.472 in.) or less the oil pump assembly must be replaced.

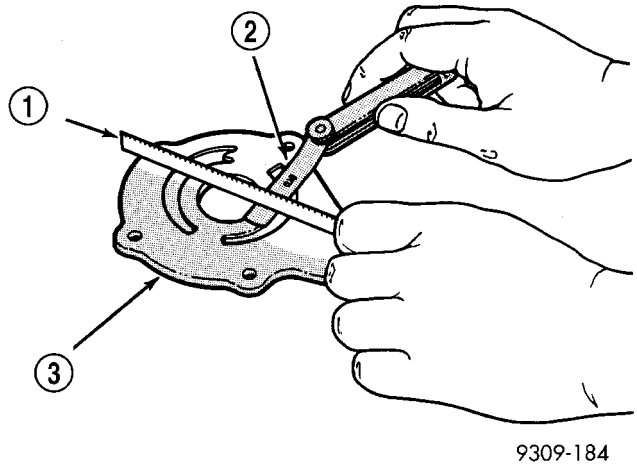

Fig. 101 Checking Oil Pump Cover Flatness

1 - STRAIGHT EDGE
2 - FEELER GAUGE
3 - OIL PUMP COVER

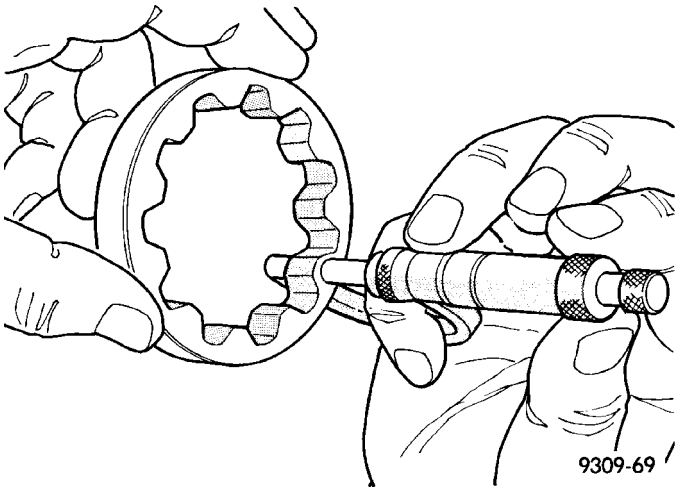

Fig. 102 Measuring Outer Rotor Thickness

(4) Measure the diameter of the outer rotor. If the outer rotor diameter measures at 85.925 mm (3.382 in.) or less the oil pump assembly must be replaced.

(5) Measure the thickness of the inner rotor (Fig. 103). If the inner rotor thickness measures at 12.005 mm (0.472 in.) or less then the oil pump assembly must be replaced.

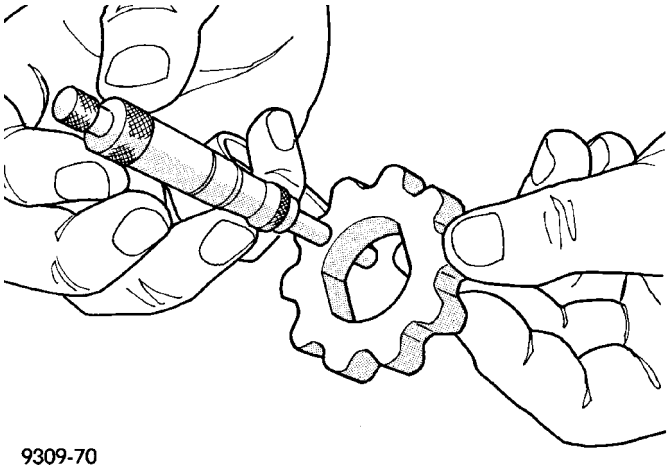

Fig. 103 Measuring Inner Rotor Thickness

OIL PUMP (Continued)

(6) Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body (Fig. 104). If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.

(7) Install the inner rotor in the into the oil pump body. Measure the clearance between the inner and outer rotors (Fig. 105). If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

(8) Place a straight edge across the body of the oil pump (between the bolt holes), if a feeler gauge of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced (Fig. 106).

NOTE: The 3.7 Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

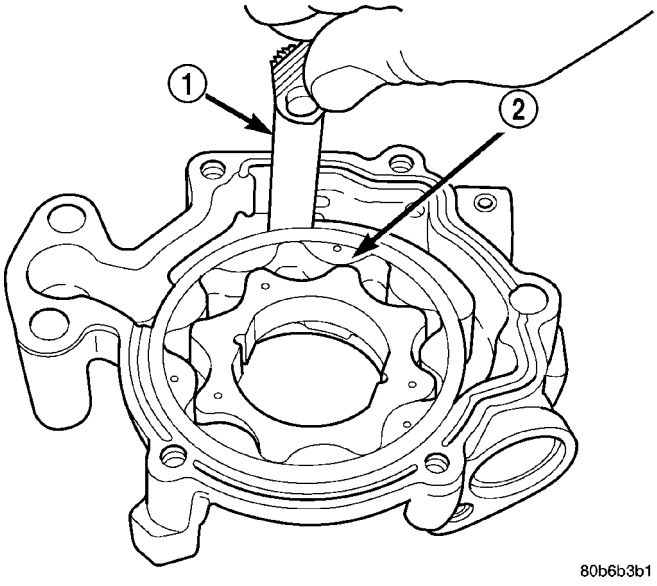

Fig. 104 Measuring Outer Rotor Clearance

1 - FEELER GAUGE
2 - OUTER ROTOR

ASSEMBLY

(1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

(2) Install inner and outer rotors

(3) Install oil pump cover plate and install cover bolts and tighten them to 12 N·m (105 in. lbs.).

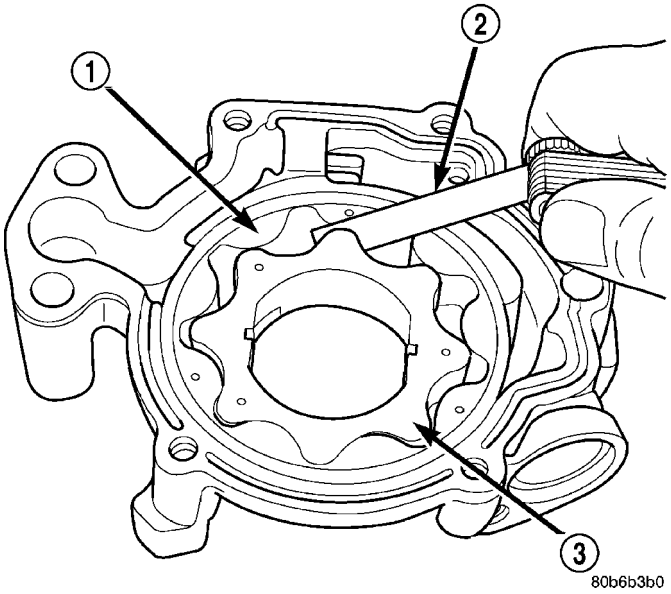

Fig. 105 Measuring Clearance Between Rotors

1 - OUTER ROTOR
2 - FEELER GAUGE
3 - INNER ROTOR

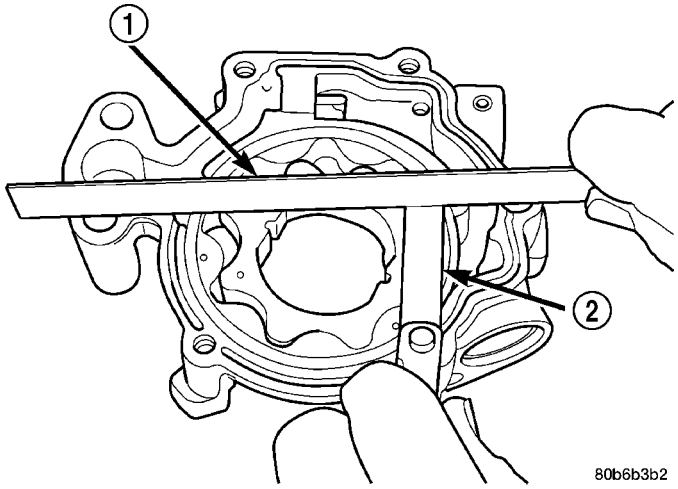

Fig. 106 Measuring Clearance Over Rotors

1 - STRAIGHT EDGE
2 - FEELER GAUGE

(4) Prime oil pump before installation by filling rotor cavity with engine oil.

(5) If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other causes for oil pressure loss.

OIL PUMP (Continued)

INSTALLATION

(1) Position the oil pump onto the crankshaft and install one oil pump retaining bolts.

(2) Position the primary timing chain tensioner and install three retaining bolts.

(3) Tighten the oil pump and primary timing chain tensioner retaining bolts to 28 N·m (250 in. lbs.) in the sequence shown (Fig. 107).

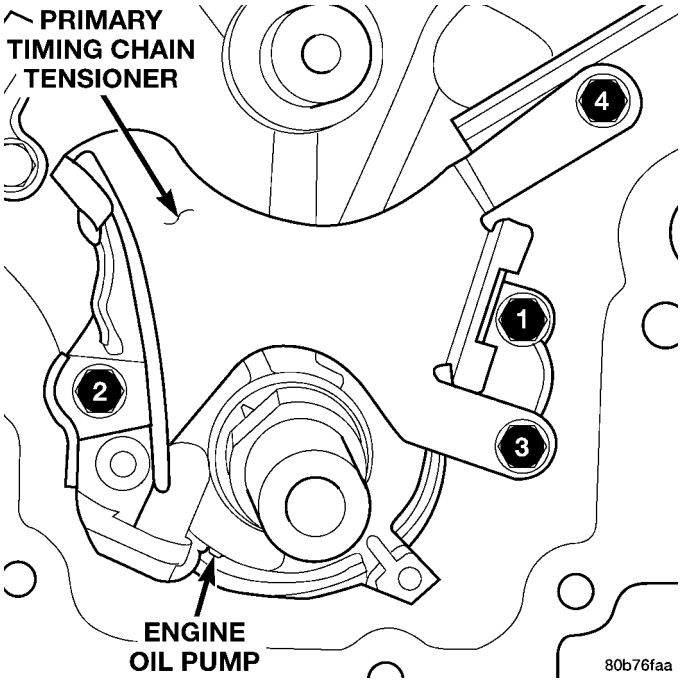

Fig. 107 Oil Pump And Primary Timing Chain Tensioner Tightening Sequence

(4) Install the secondary timing chain tensioners and timing chains (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(5) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(6) Install the pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD

DESCRIPTION

The intake manifold is made of a composite material and features long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of eight individual press in place port gaskets to prevent leaks. Eight studs and two bolts are used to fasten the intake to the head.

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.

(2) Spray a small stream of water at the suspected leak area.

(3) If a change in RPM is observed the area of the suspected leak has been found.

(4) Repair as required.

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove resonator assembly and air inlet hose.

(3) Disconnect throttle and speed control cables.

(4) Disconnect electrical connectors for the following components:

- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor

(5) Disconnect brake booster hose and positive crankcase ventilation (PCV) hose.

(6) Disconnect generator electrical connections.

(7) Disconnect air conditioning compressor electrical connections.

(8) Disconnect left and right radio suppressor straps.

(9) Disconnect and remove ignition coil towers (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL).

(10) Remove top oil dipstick tube retaining bolt and ground strap.

(11) Bleed fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(12) Remove fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL).

(13) Remove throttle body assembly and mounting bracket.

(14) Drain cooling system below coolant temperature level (Refer to 7 - COOLING - STANDARD PROCEDURE).

(15) Remove the heater hoses from the engine front cover and the heater core.

(16) Unclip and remove heater hoses and tubes from intake manifold (Fig. 108).

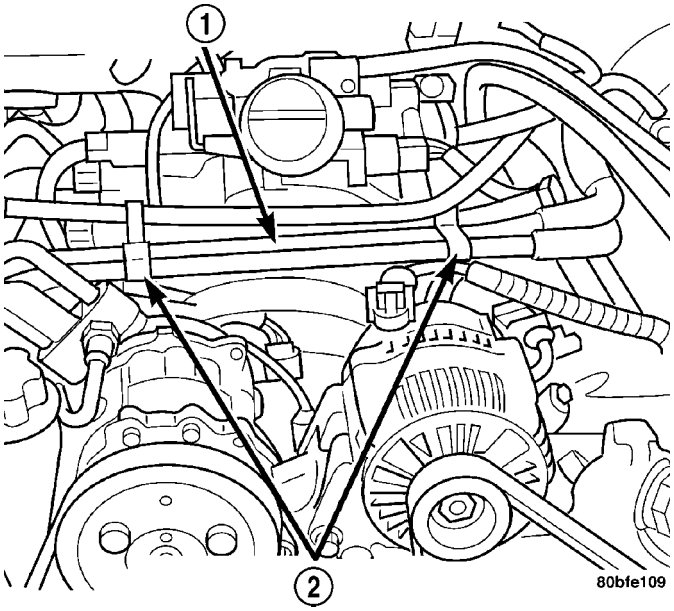

Fig. 108 Heater Hoses and Tubes Removal / Installation

1 - HEATER HOSES AND TUBES
2 - ROUTING/RETAINING CLIPS

(17) Remove coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMPERATURE SENSO - REMOVAL).

(18) Remove intake manifold retaining fasteners in reverse order of tightening sequence (Fig. 109).

(19) Remove intake manifold.

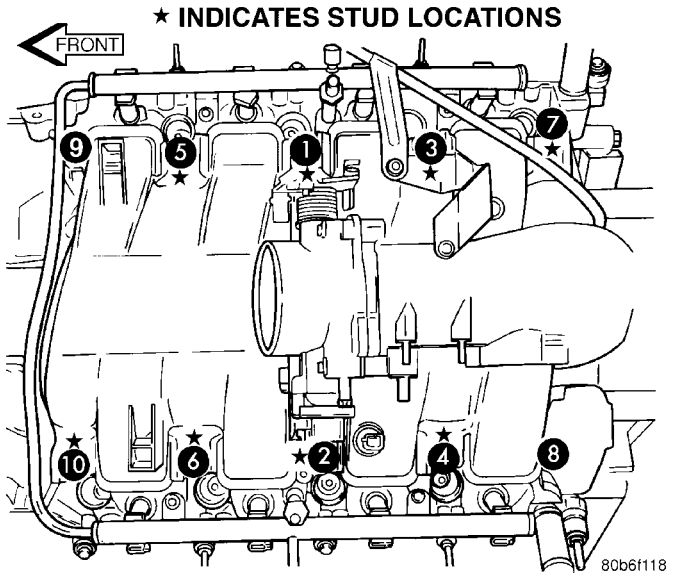

Fig. 109 Intake Manifold Tightening Sequence

CLEANING

NOTE: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

INSPECTION

(1) Inspect the intake sealing surface for cracks, nicks and distortion.

(2) Inspect the intake manifold vacuum hose fittings for looseness or blockage.

(3) Inspect the manifold to throttle body mating surface for cracks, nicks and distortion.

INSTALLATION

(1) Install intake manifold gaskets.

(2) Position intake manifold.

(3) Install intake manifold retaining bolts and tighten in sequence shown in (Fig. 109) to 12 N·m (105 in. lbs.).

(4) Install left and right radio suppressor straps.

(5) Install throttle body assembly.

(6) Install throttle cable bracket.

(7) Connect throttle cable and speed control cable to throttle body.

(8) Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).

(9) Install ignition coil towers (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - INSTALLATION).

(10) Position and install heater hoses and tubes onto intake manifold.

(11) Install the heater hoses to the heater core and engine front cover.

(12) Connect electrical connectors for the following components:

- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor
- Ignition coil towers
- Fuel injectors

(13) Install top oil dipstick tube retaining bolt and ground strap.

(14) Connect generator electrical connections.

(15) Connect Brake booster hose and Positive crankcase ventilation (PCV) hose.

(16) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(17) Install resonator assembly and air inlet hose.

(18) Connect negative cable to battery.

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

REMOVAL

RIGHT EXHAUST MANIFOLD

(1) Disconnect negative cable for battery.

(2) Remove air cleaner assembly, resonator assembly and air inlet hose.

(3) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

(5) Remove A/C accumulator support bracket fastener.

(6) Drain coolant below heater hose level (Refer to 7 - COOLING - STANDARD PROCEDURE).

(7) Remove heater hoses at engine.

(8) Remove fasteners attaching exhaust manifold heat shield.

(9) Remove heat shield.

(10) Remove upper exhaust manifold attaching fasteners.

(11) Raise vehicle on hoist.

(12) Disconnect exhaust pipe from manifold.

(13) Remove fasteners attaching starter. Move starter aside.

(14) Remove lower exhaust manifold attaching fasteners.

(15) Remove exhaust manifold and gasket (Fig. 110). Manifold is removed from below the engine compartment.

EXHAUST MANIFOLD (Continued)

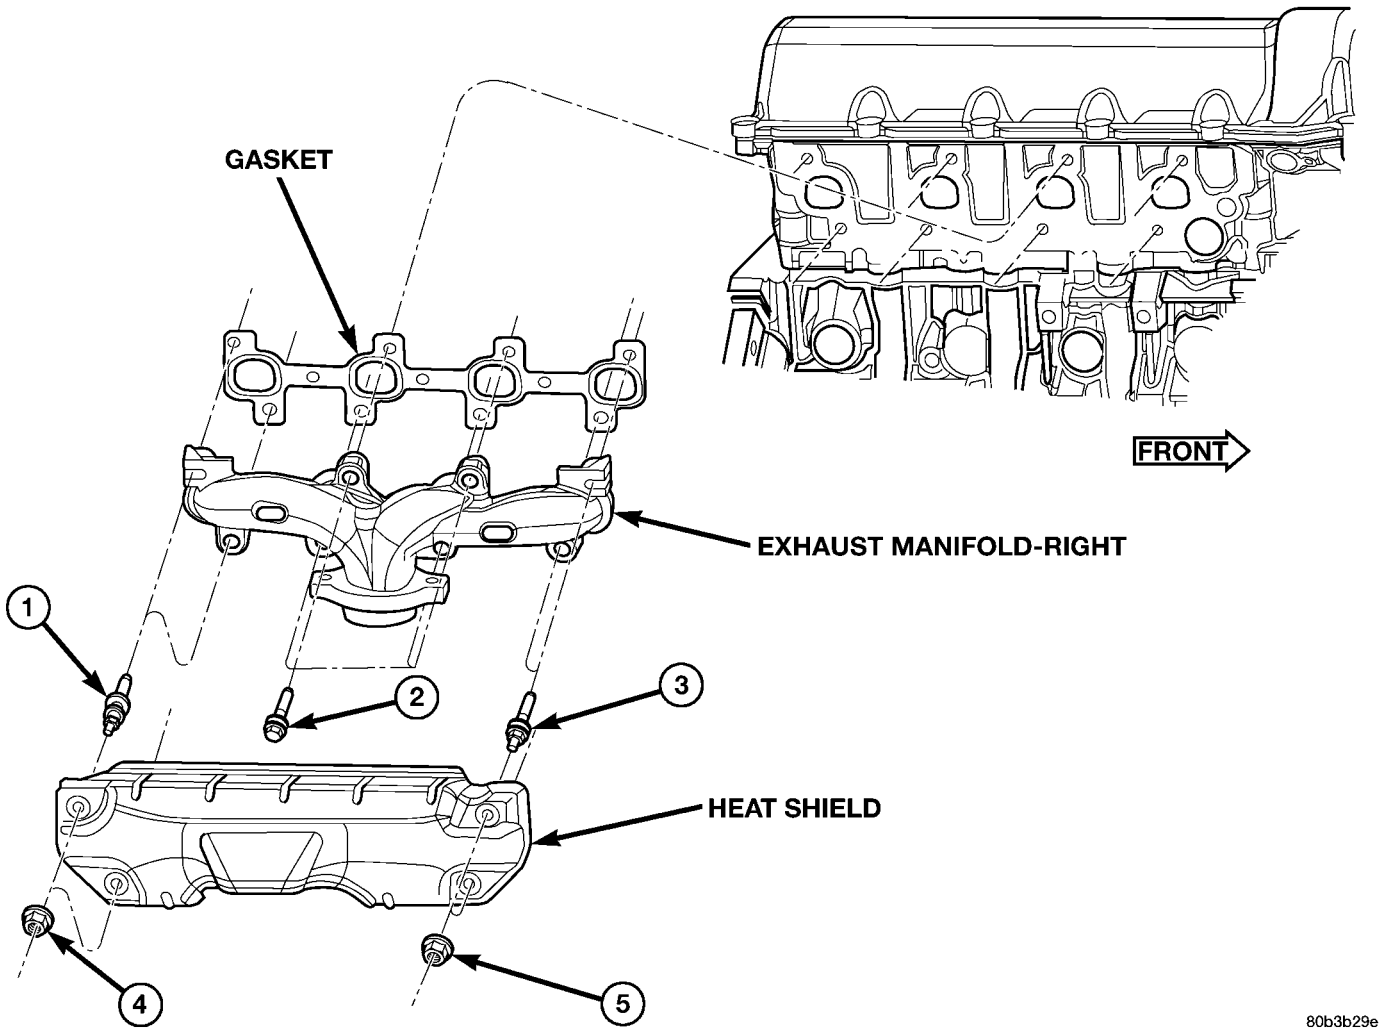

Fig. 110 Exhaust Manifold—Right

EXHAUST MANIFOLD (Continued)

LEFT EXHAUST MANIFOLD

(1) Disconnect negative cable for battery.
(2) Hoist vehicle.
(3) Disconnect exhaust pipe at manifold.
(4) Lower vehicle.
(5) Remove the front two exhaust heat shield retaining fasteners. Raise vehicle and remove the fasteners at rear of heat shield.
(6) Remove heat shield (Fig. 111).
(7) Lower vehicle and remove the upper exhaust manifold retaining bolts (Fig. 111).
(8) Raise vehicle and remove the lower exhaust manifold retaining bolts (Fig. 111).
(9) Remove exhaust manifold and gasket (Fig. 111). Manifold is removed from below the engine compartment.

CLEANING

(1) Clean the exhaust manifold using a suitable cleaning solvent, then allow to air dry.
(2) Clean all gasket residue from the manifold mating surface.

INSPECTION

(1) Inspect the exhaust manifold for cracks in the mating surface and at every mounting bolt hole.
(2) Using a straight edge and a feeler gauge, check the mating surface for warp and twist.
(3) Inspect the manifold to exhaust pipe mating surface for cracks, gouges, or other damage that would prevent sealing.

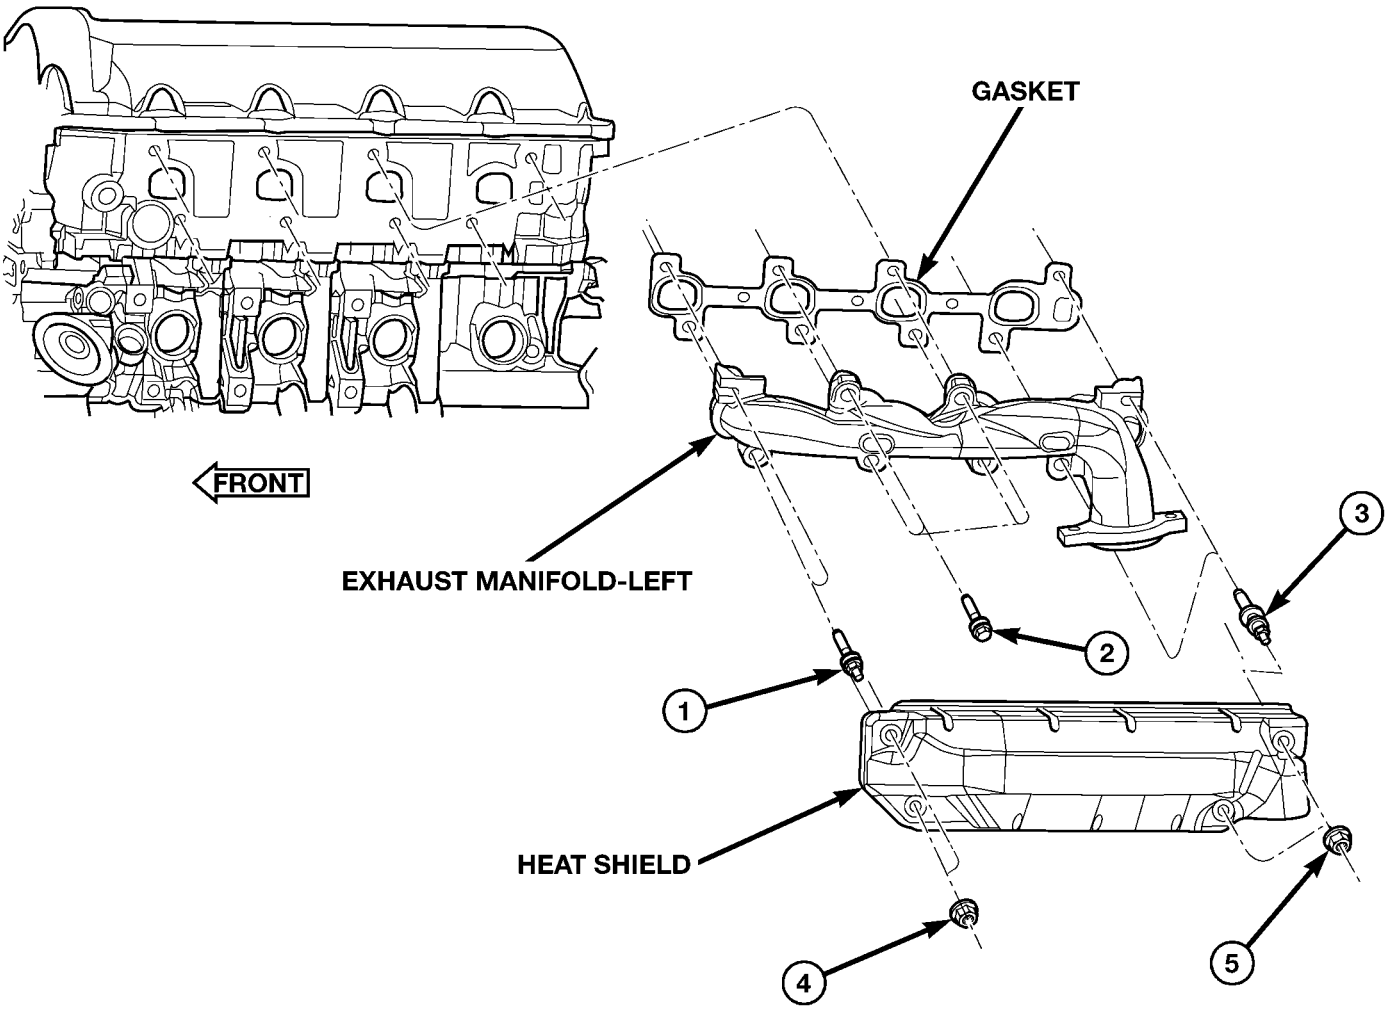

Fig. 111 Exhaust Manifold—Left

ITEM	DESCRIPTION	TORQUE	ITEM	DESCRIPTION	TORQUE
1	Stud (Qty 2)		4	Nut (Qty 2)	8 N·m (72 in. lbs.), then loosen 45 degrees
2	Bolt (Qty 4)	25 N·m (18 ft. lbs.)	5	Nut (Qty 2)	
3	Stud (Qty 2)				

EXHAUST MANIFOLD (Continued)

INSTALLATION

RIGHT EXHAUST MANIFOLD

(1) Install exhaust manifold and gasket (Fig. 112) from below engine compartment.

(2) Install lower exhaust manifold fasteners. DO NOT tighten until all fasteners are in place.

(3) Lower vehicle and install upper exhaust manifold fasteners. Tighten all manifold bolts starting at center and working outward to 25 N·m (18 ft. lbs.).

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

(4) Install exhaust manifold heat shield. Tighten fasteners to 8 N·m (72 in. lbs.), then loosen 45 degrees.

(5) Install starter and fasteners.

(6) Connect exhaust pipe to manifold.

(7) Connect heater hoses at engine.

(8) Install fastener attaching A/C accumulator.

(9) Install A/C compressor and fasteners.

(10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(11) Install air cleaner assembly, resonator assembly and air inlet hose.

(12) Install battery and connect cables.

(13) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

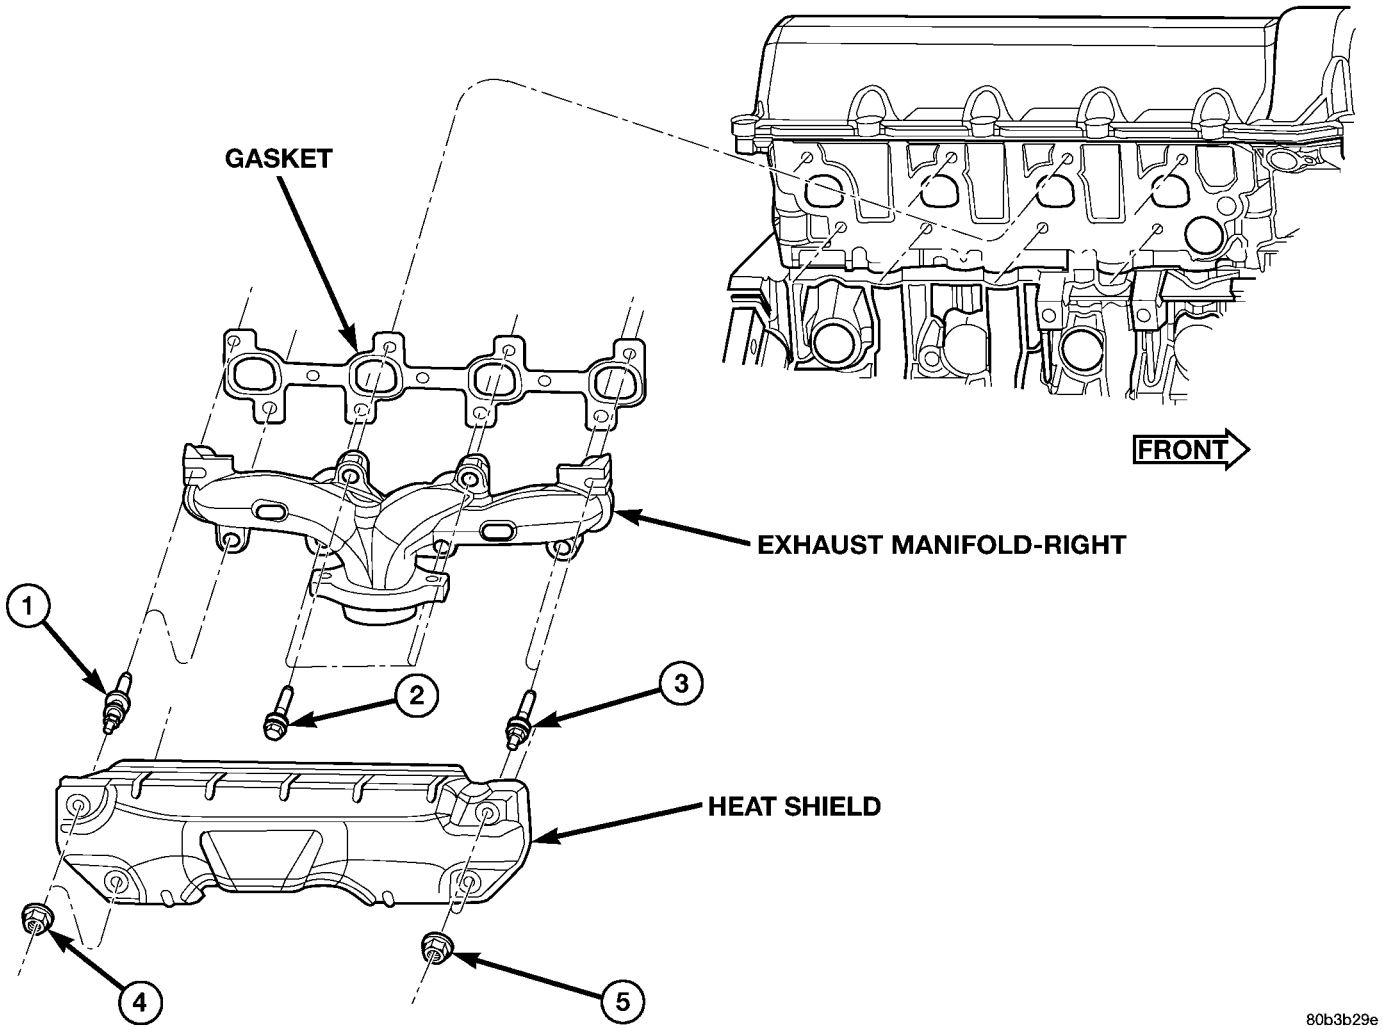

Fig. 112 Exhaust Manifold—Right

ITEM	DESCRIPTION	TORQUE	ITEM	DESCRIPTION	TORQUE

VALVE TIMING

DESCRIPTION—TIMING DRIVE SYSTEM

The timing drive system (Fig. 114) has been designed to provide quiet performance and reliability to support a **non-free wheeling** engine. Specifically the intake valves are non-free wheeling and can be easily damaged with forceful engine rotation if camshaft-to-crankshaft timing is incorrect. The timing drive system consists of a primary chain and two secondary timing chain drives.

OPERATION - TIMING DRIVE SYSTEM

The primary timing chain is a single inverted tooth type. The primary chain drives the large fifty tooth idler sprocket directly from a 25 tooth crankshaft sprocket. Primary chain motion is controlled by a pivoting leaf spring tensioner arm and a fixed guide. The arm and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication from the secondary chain drive and oil pump leakage. The idler sprocket assembly connects the primary and secondary chain drives. The idler sprocket assembly consists of two integral thirty tooth sprockets and a fifty tooth sprocket that is splined to the assembly. The spline joint is a non – serviceable press fit anti rattle type. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the two bushings used in the idler sprocket assembly.

There are two secondary drive chains, both are inverted tooth type, one to drive the camshaft in each SOHC cylinder head. There are no shaft speed changes in the secondary chain drive system. Each secondary chain drives a thirty tooth cam sprocket directly from the thirty tooth sprocket on the idler

10 - PRIMARY CHAIN TENSIONER
11 - TWO PLATED LINKS ON LEFT CAMSHAFT CHAIN
12 - SECONDARY TENSIONER ARM

VALVE TIMING (Continued)

sprocket assembly. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The hydraulic tensioners for the secondary chain systems are fed pressurized oil from oil reservoir pockets in the block. Each tensioner also has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The secondary timing chains receive lubrication from a small orifice in the tensioners. This orifice is protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE

STANDARD PROCEDURE—MEASURING TIMING CHAIN WEAR

NOTE: This procedure must be performed with the timing chain cover removed.

(1) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) To determine if the secondary timing chains are worn, rotate the engine clockwise until maximum tensioner piston extension is obtained. Measure the distance between the secondary timing chain tensioner housing and the step ledge on the piston (Fig. 115). The measurement at point (A) must be less than 15mm (0.5906 inches).

(3) If the measurement exceeds the specification the secondary timing chains are worn and require replacement. (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

NOTE: If the secondary chains are to be replaced the primary chain must also be replaced.

STANDARD PROCEDURE - ENGINE TIMING - VERIFICATION

CAUTION: The 4.7L is a non free-wheeling design engine. Therefore, correct engine timing is critical.

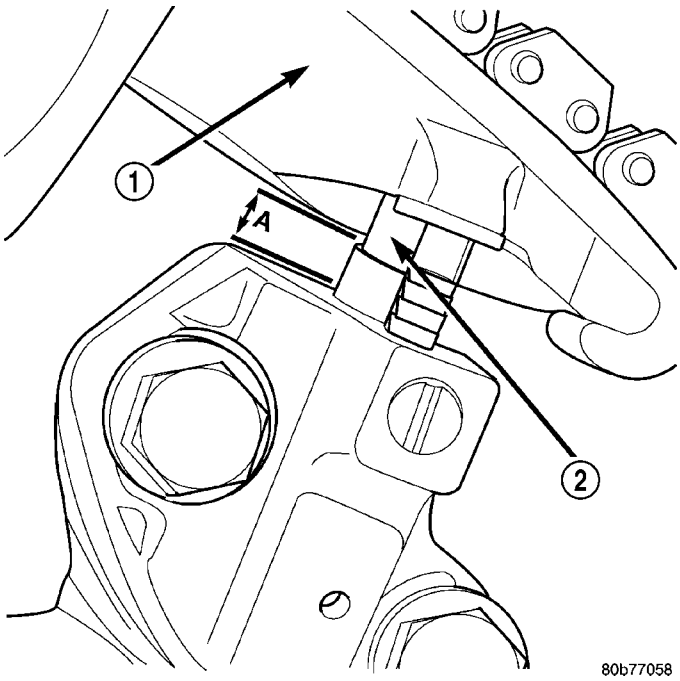

Fig. 115 Measuring Secondary Timing Chains For Wear

1 - SECONDARY TENSIONER ARM
2 - SECONDARY CHAIN TENSIONER PISTON

NOTE: Components referred to as left hand or right hand are as viewed from the drivers position inside the vehicle.

NOTE: The blue link plates on the chains and the dots on the camshaft drive sprockets may not line up during the timing verification procedure. The blue link plates are lined up with the sprocket dots only when re-timing the complete timing drive. Once the timing drive is rotated blue link-to-dot alignment is no longer valid.

Engine base timing can be verified by the following procedure:

(1) Remove the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

VALVE TIMING (Continued)

(2) Using a mirror, locate the TDC arrow on the front cover (Fig. 116). Rotate the crankshaft until the mark on the crankshaft damper is aligned with the TDC arrow on the front cover. The engine is now at TDC.

(3) Note the location of the V8 mark stamped into the camshaft drive gears (Fig. 117). If the V8 mark on each camshaft drive gear is at the twelve o'clock position, the engine is at TDC (cylinder #1) on the exhaust stroke. If the V8 mark on each gear is at the six o'clock position, the engine is at TDC (cylinder #1) on the compression stroke.

(4) If both of the camshaft drive gears are off in the same or opposite directions, the primary chain or both secondary chains are at fault. Refer to Timing Chain and Sprockets procedure in this section.

(5) If only one of the camshaft drive gears is off and the other is correct, the problem is confined to one secondary chain. Refer to Single camshaft timing, in this procedure.

(6) If both camshaft drive gear V8 marks are at the twelve o'clock or the six o' clock position the engine base timing is correct. Reinstall the cylinder head covers.

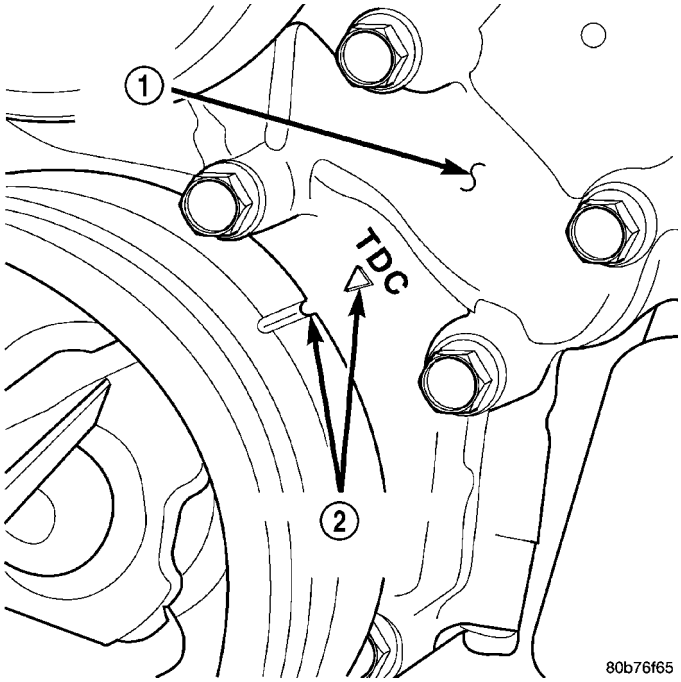

Fig. 116 Engine Top Dead Center (TDC) Indicator Mark

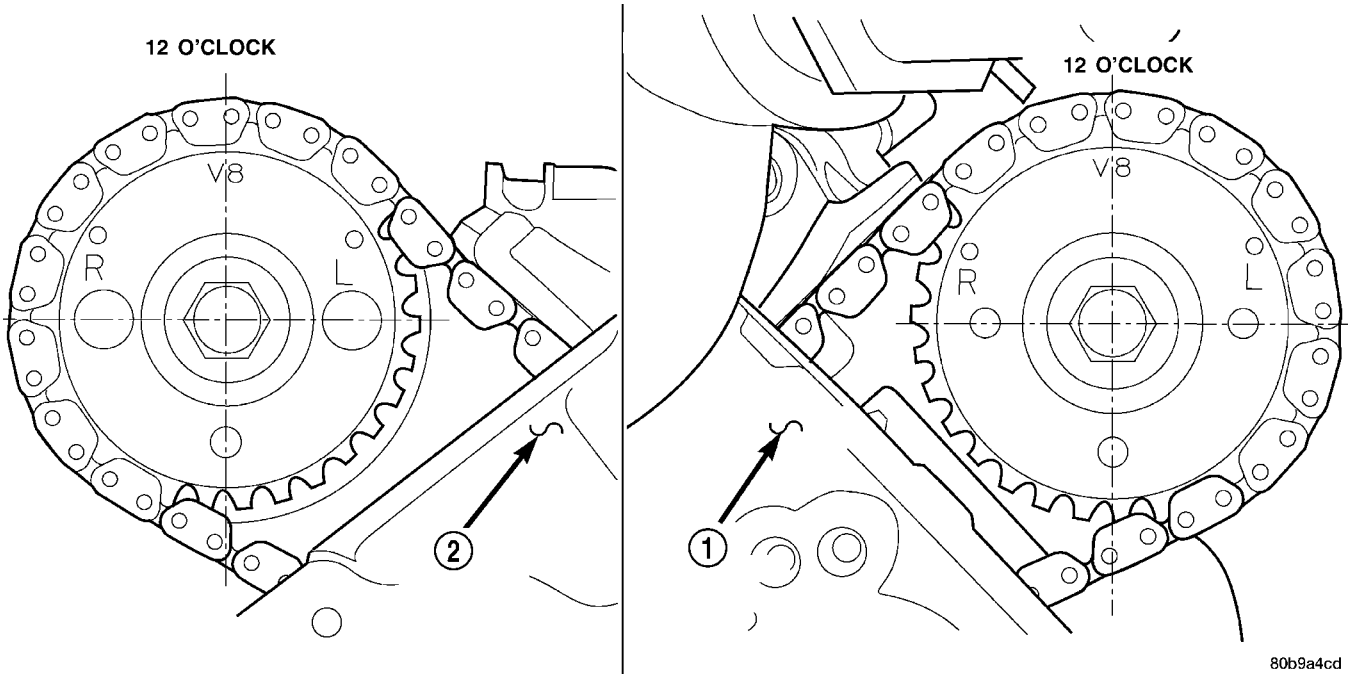

Fig. 117 Camshaft Sprocket V8 Marks

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

VALVE TIMING (Continued)

SINGLE CAMSHAFT TIMING

NOTE: to adjust the timing on one camshaft, preform the following procedure.

(1) Using Chain Tensioner Wedge, special tool 8350, stabilize the secondary chain drive (Fig. 118). For reference purposes, mark the chain-to-sprocket position (Fig. 118).
(2) Remove the camshaft drive gear retaining bolt.
(3) Carefully remove the camshaft drive gear from the camshaft.
(4) Re-index the camshaft drive gear in the chain until the V8 mark is at the same position as the V8 mark on the opposite camshaft drive gear.

NOTE: When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(5) Using a suitable pair of adjustable pliers, rotate the camshaft until the alignment dowel on the camshaft is aligned with the slot in the camshaft drive gear (Fig. 119).

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.

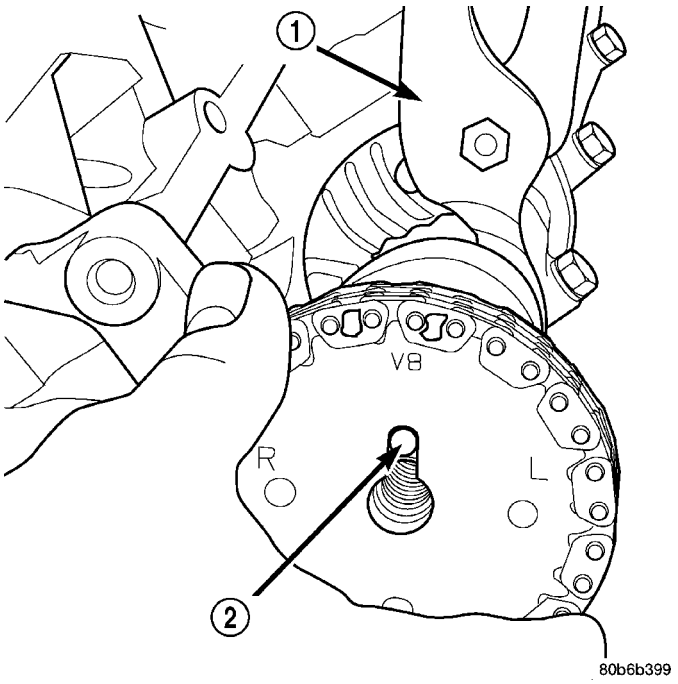

Fig. 119 Camshaft Dowel

4 - SPECIAL TOOL 8350 WEDGE

VALVE TIMING (Continued)

(6) Position the camshaft drive gear onto the camshaft, remove oil from bolt then install the retaining bolt. Using Special Tools, Spanner Wrench 6958 with Adapter Pins 8346 and a suitable torque wrench, Tighten retaining bolt to 122N·m (90 ft. Lbs.) (Fig. 120) (Fig. 121).

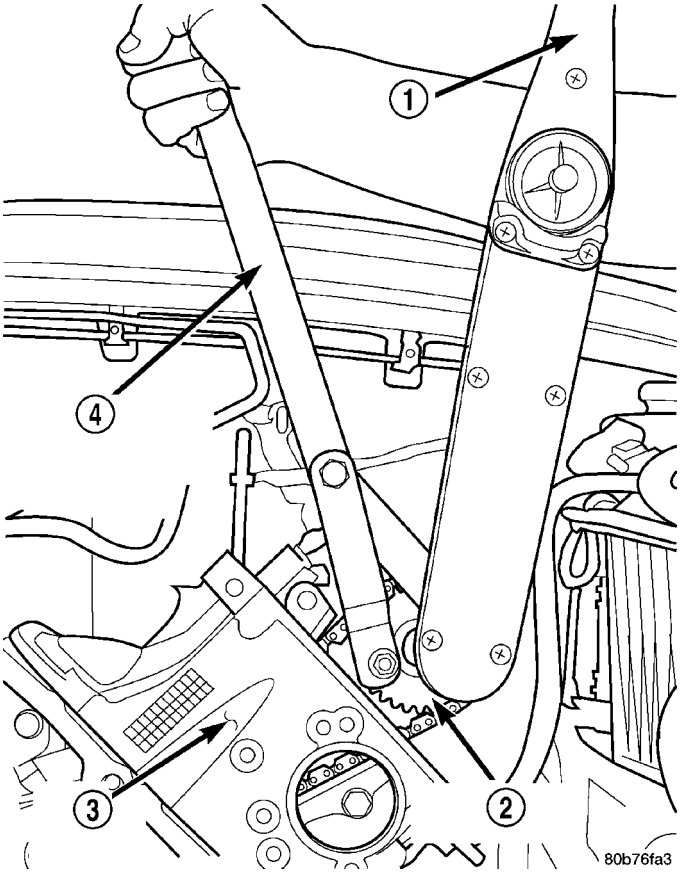

Fig. 120 Camshaft Sprocket Left Cylinder Head

1 - TORQUE WRENCH
2 - CAMSHAFT SPROCKET
3 - LEFT CYLINDER HEAD
4 - SPECIAL TOOL 6958 SPANNER WITH ADAPTER PINS 8346

(7) Remove special tool 8350.

(8) Rotate the crankshaft two full revolutions, then reverify that the camshaft drive gear V8 marks are in fact aligned.

(9) Install the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

TIMING BELT / CHAIN COVER(S)

REMOVAL

(1) Disconnect the battery negative cable.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Disconnect both heater hoses at timing cover.

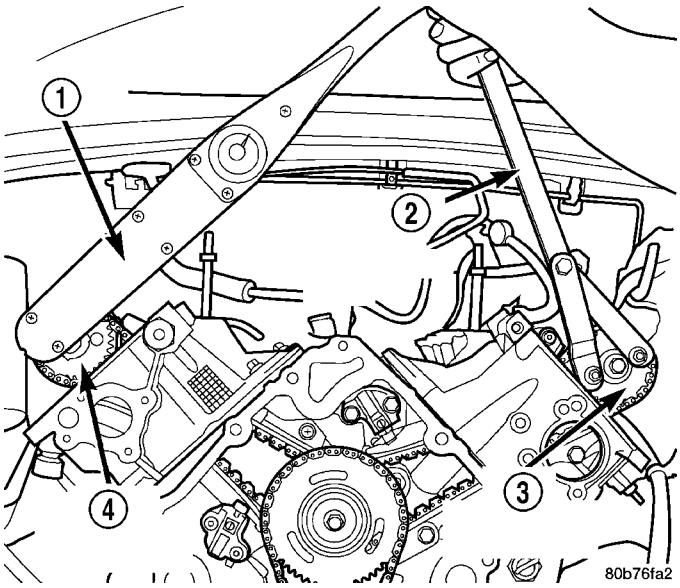

Fig. 121 Camshaft Sprocket Installation—Right Cylinder Head

1 - TORQUE WRENCH
2 - SPECIAL TOOL 6958 WITH ADAPTER PINS 8346
3 - LEFT CAMSHAFT SPROCKET
4 - RIGHT CAMSHAFT SPROCKET

(4) Disconnect lower radiator hose at engine.

(5) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(6) Remove accessory drive belt tensioner assembly (Fig. 122).

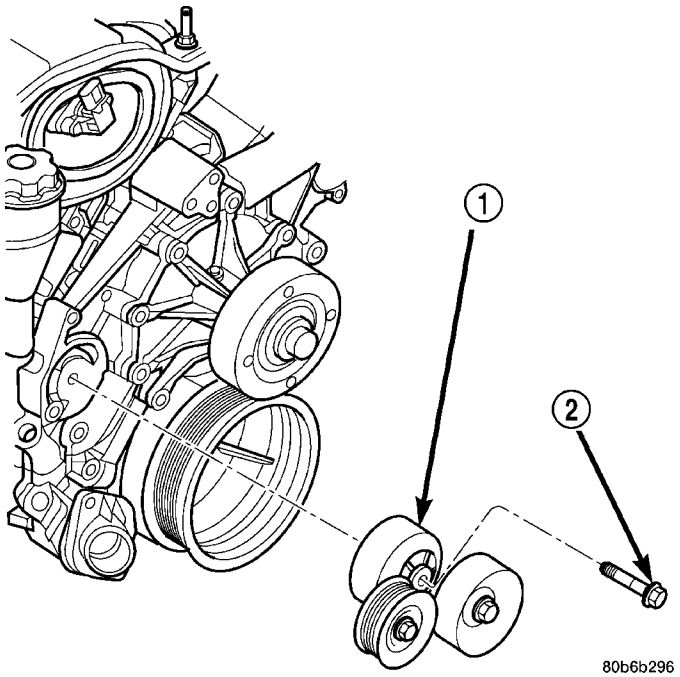

Fig. 122 Accessory Drive Belt Tensioner

1 - TENSIONER ASSEMBLY
2 - FASTENER TENSIONER TO FRONT COVER

TIMING BELT / CHAIN COVER(S) (Continued)

(7) Remove the generator and A/C compressor.

CAUTION: The 4.7L engine uses an RTV sealer instead of a gasket to seal the front cover to the engine block, from the factory. For service, Mopar® Engine RTV sealant must be substituted.

NOTE: It is not necessary to remove the water pump for timing cover removal.

(8) Remove the bolts holding the timing cover to engine block. (Fig. 123).
(9) Remove cover (Fig. 123).

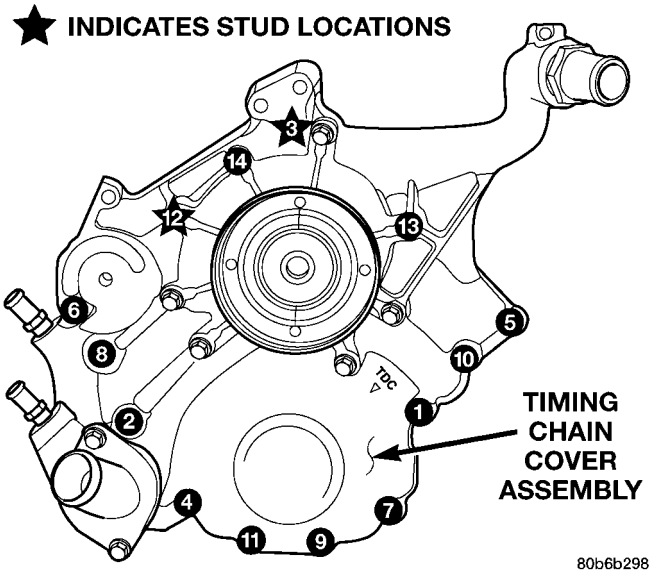

Fig. 123 Timing Chain Cover Fasteners

INSTALLATION

CAUTION: Do not use oil based liquids to clean timing cover or block surfaces. Use only rubbing alcohol, along with plastic or wooden scrapers. Use no wire brushes or abrasive wheels or metal scrapers, or damage to surfaces could result.

(1) Clean timing chain cover and block surface using rubbing alcohol.

CAUTION: The 4.7L can use a special RTV sealer instead of a carrier gasket to seal the timing cover to the engine block, from the factory. For service repairs, Mopar® Engine RTV must be used as a substitute, if RTV is present.

(2) Inspect the water passage o-rings for any damage, and replace as necessary.
(3) Apply Mopar® Engine RTV sealer to the front cover following the path below, using a 3 to 4mm thick bead (Fig. 124).

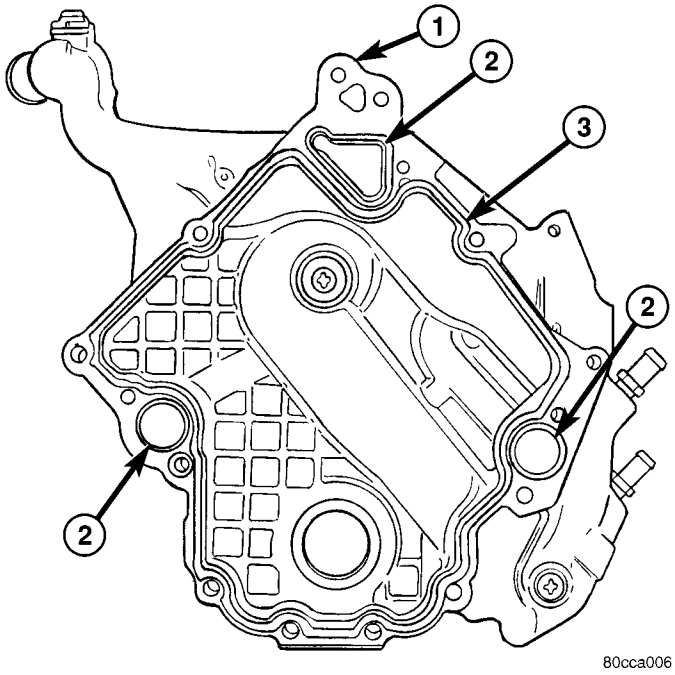

Fig. 124 Timing Cover Sealant

1 - TIMING CHAIN COVER
2 - WATER PASSAGE ORING
3 - MOPAR® ENGINE RTV SEALER

(4) Install cover. Tighten flange head fasteners in sequence as shown in (Fig. 125) to 58 N·m (43 ft. lbs.).

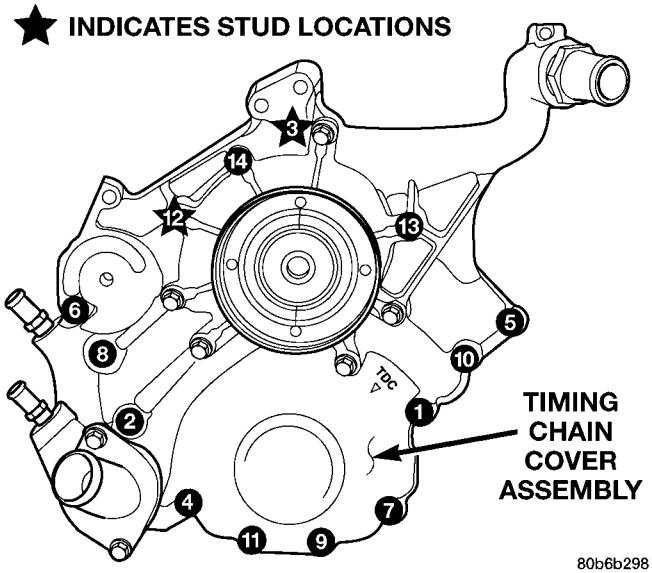

Fig. 125 Timing Chain Cover Fasteners

(5) Install the A/C compressor and generator.
(6) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(7) Install accessory drive belt tensioner assembly. Tighten fastener to 54 N·m (40 ft. lbs.).

TIMING BELT / CHAIN COVER(S) (Continued)

(8) Install lower radiator hose.
(9) Install both heater hoses.
(10) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(11) Connect the battery negative cable.

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

(1) Disconnect negative cable from battery.
(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(3) Remove right and left cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(4) Remove radiator fan shroud.
(5) Rotate engine until timing mark on crankshaft damper aligns with TDC mark on timing chain cover (Fig. 126) (#1 cylinder exhaust stroke) and the camshaft sprocket "V8" marks are at the 12 o'clock position (Fig. 127).
(6) Remove power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).

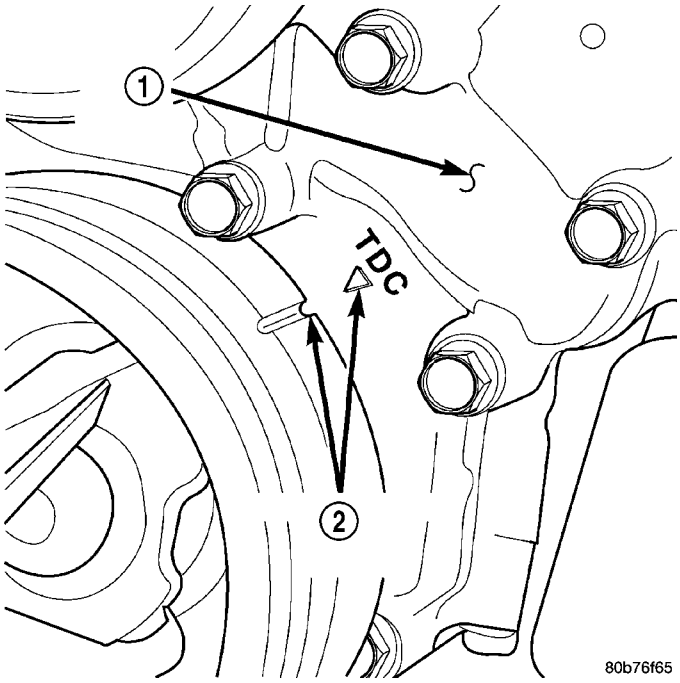

Fig. 126 Engine Top Dead Center (TDC) Indicator Mark

1 - TIMING CHAIN COVER
2 - CRANKSHAFT TIMING MARKS

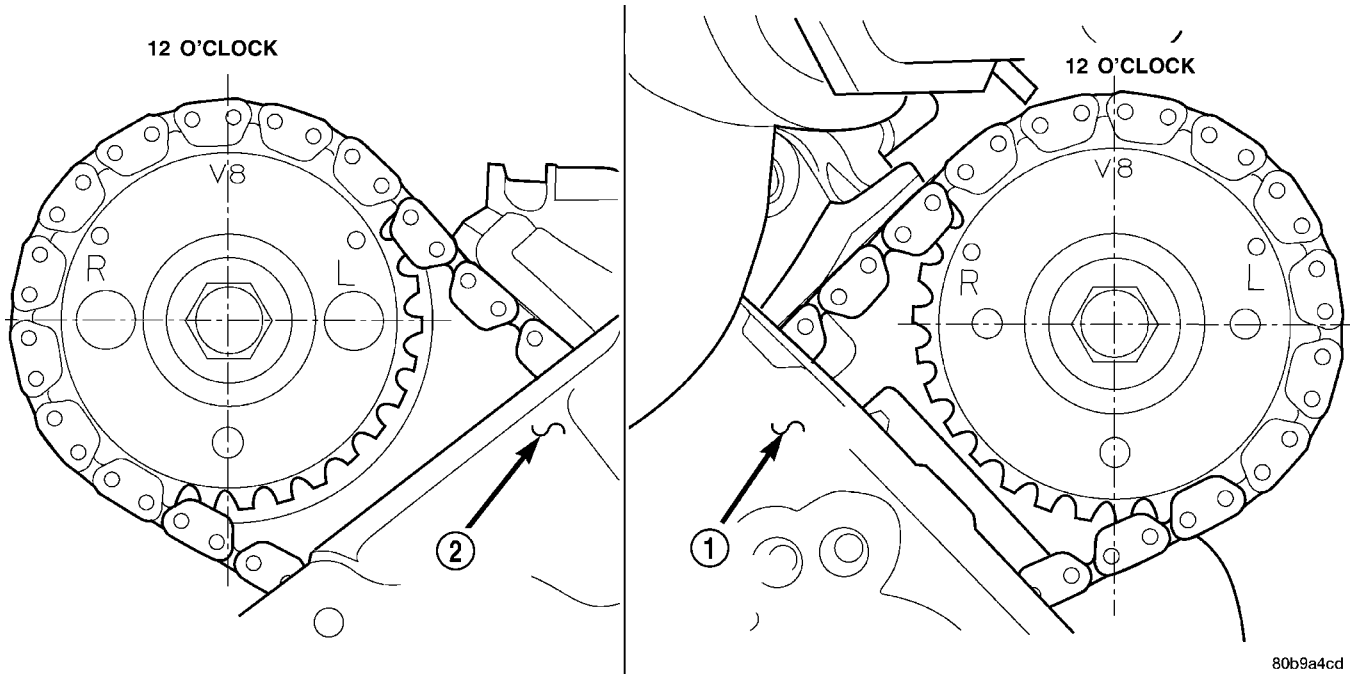

Fig. 127 Camshaft Sprocket V8 Marks

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(7) Remove access plugs (2) from left and right cylinder heads for access to chain guide fasteners (Fig. 128).

(8) Remove the oil fill housing to gain access to the right side tensioner arm fastener.

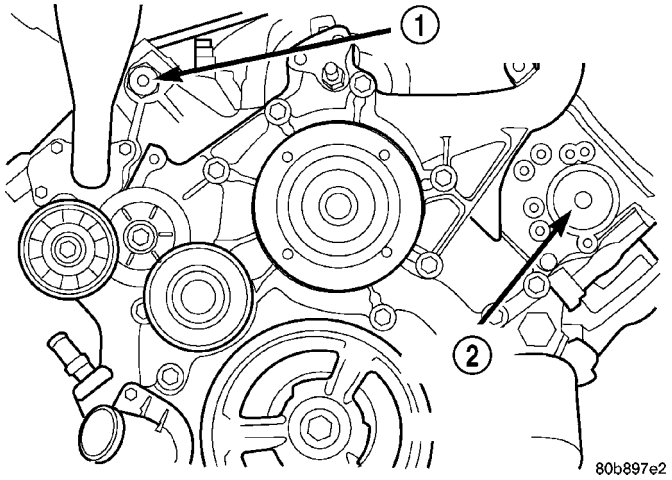

Fig. 128 Cylinder Head Access Plug Location

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

(9) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(10) Collapse and pin primary chain tensioner (Fig. 129).

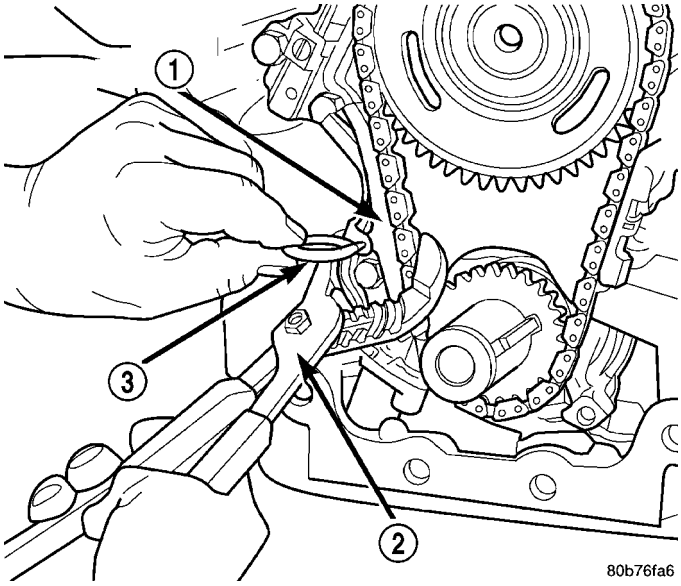

Fig. 129 Collapsing And Pinning Primary Chain Tensioner

1 - PRIMARY CHAIN TENSIONER
2 - ADJUSTABLE PLIERS
3 - SPECIAL TOOL 8514

CAUTION: Plate behind left secondary chain tensioner could fall into oil pan. Therefore, cover pan opening.

(11) Remove secondary chain tensioners.

(12) Remove camshaft position sensor from right cylinder head (Fig. 130).

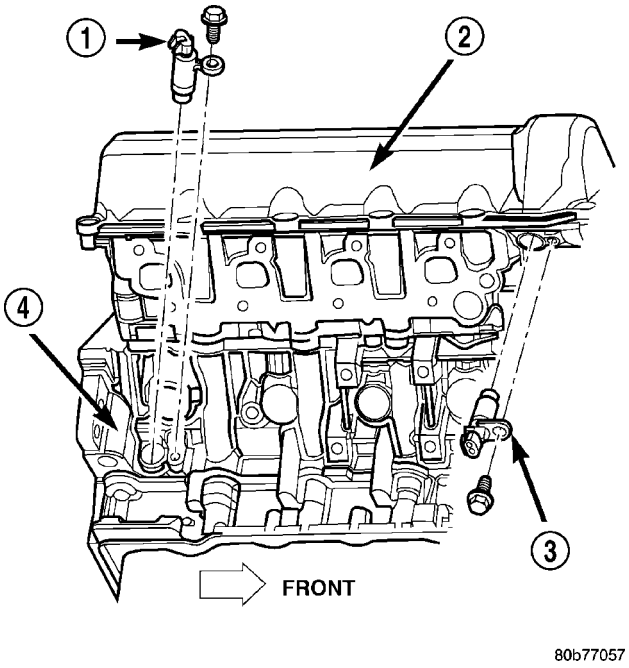

Fig. 130 Camshaft Position Sensor—Removal

1 - CRANKSHAFT POSITION SENSOR
2 - CYLINDER HEAD COVER
3 - CAMSHAFT POSITION SENSOR
4 - RIGHT SIDE CYLINDER BLOCK

CAUTION: Care should be taken not to damage camshaft target wheel. Do not hold target wheel while loosening or tightening camshaft sprocket. Do not place the target wheel near a magnetic source of any kind. A damaged or magnetized target wheel could cause a vehicle no start condition.

CAUTION: Do not forcefully rotate the camshafts or crankshaft independently of each other. Damaging intake valve to piston contact will occur. Ensure negative battery cable is disconnected to guard against accidental starter engagement.

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(13) Remove left and right camshaft sprocket bolts.

(14) While holding the left camshaft steel tube with adjustable pliers, (Fig. 131) remove the left camshaft sprocket. Slowly rotate the camshaft approximately 15 degrees clockwise to a neutral position.

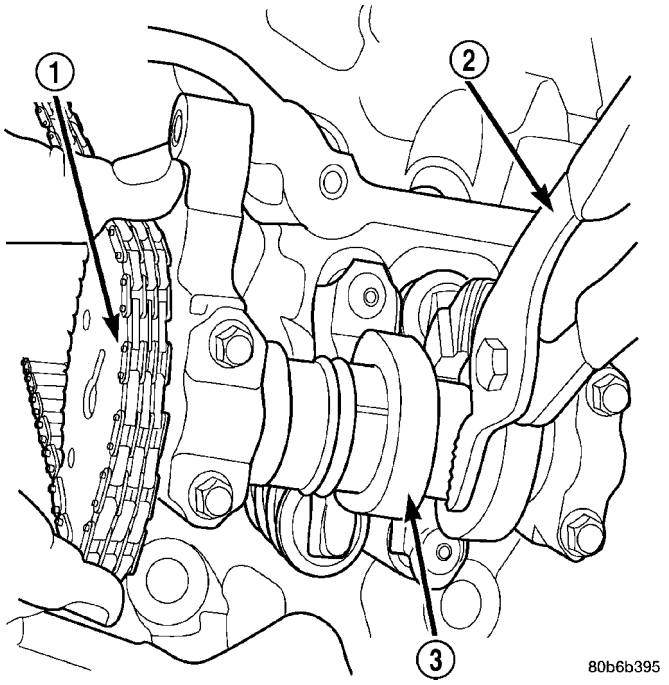

Fig. 131 Camshaft Rotation—Left Side

1 - CAMSHAFT SPROCKET AND CHAIN
2 - ADJUSTABLE PLIERS
3 - CAMSHAFT

(15) While holding the right camshaft steel tube with adjustable pliers, (Fig. 132) remove the right camshaft sprocket. Slowly rotate the camshaft approximately 45 degrees counterclockwise to a neutral position.

(16) Remove idler sprocket assembly bolt.

(17) Slide the idler sprocket assembly and crank sprocket forward simultaneously to remove the primary and secondary chains.

(18) Remove both pivoting tensioner arms and chain guides.

(19) Remove chain tensioner.

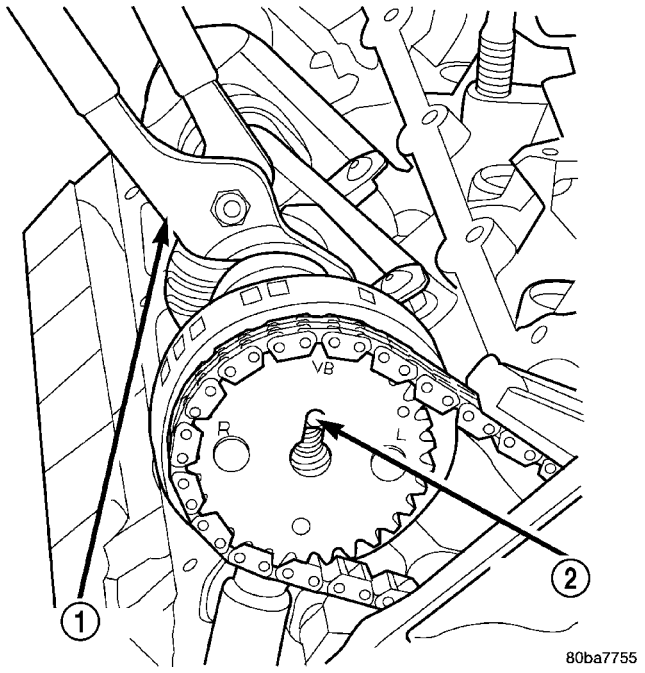

Fig. 132 Camshaft Rotation—Right Side

1 - ADJUSTABLE PLIERS
2 - CAMSHAFT DOWEL

INSPECTION

Inspect the following components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Idler sprocket assembly spline joint. The joint should be tight with no backlash or axial movement.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep. If plastic face is severely grooved or melted, the tensioner lube jet may be clogged. The tensioner should be replaced.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner and tensioner arm should be replaced.
- Primary chain tensioner plastic faces. Replace as required (Fig. 133).

TIMING BELT/CHAIN AND SPROCKETS (Continued)

10 - PRIMARY CHAIN TENSIONER
11 - TWO PLATED LINKS ON LEFT CAMSHAFT CHAIN
12 - SECONDARY TENSIONER ARM

TIMING BELT/CHAIN AND SPROCKETS (Continued)

INSTALLATION

(1) Using a vise, lightly compress the secondary chain tensioner piston until the piston step is flush with the tensioner body. Using a pin or suitable tool, release ratchet pawl by pulling pawl back against spring force through access hole on side of tensioner. While continuing to hold pawl back, Push ratchet device to approximately 2 mm from the tensioner body. Install Special Tool 8514 lock pin into hole on front of tensioner. Slowly open vise to transfer piston spring force to lock pin (Fig. 134).

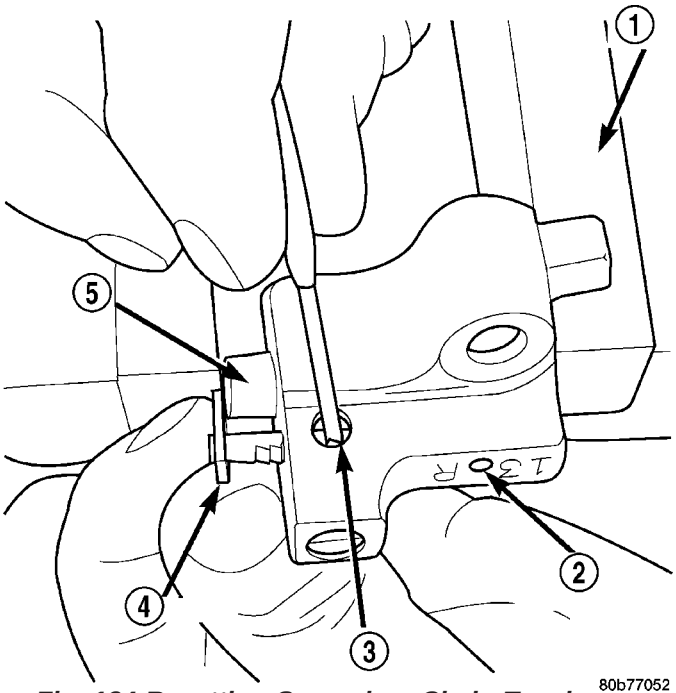

Fig. 134 Resetting Secondary Chain Tensioners

1 - VISE
2 - INSERT LOCK PIN
3 - RATCHET PAWL
4 - RATCHET
5 - PISTON

(2) Position primary chain tensioner over oil pump and insert bolts into lower two holes on tensioner bracket. Tighten bolts to 28 N·m (250 in. lbs.).

CAUTION: Overtightening the tensioner arm torx® bolt can cause severe damage to the cylinder head. Tighten torx® bolt to specified torque only.

(3) Install right side chain tensioner arm. Apply Mopar® Lock N, Seal to torx® bolt, tighten bolt to 17 N·m (150 in. lbs.).

NOTE: The silver bolts retain the guides to the cylinder heads and the black bolts retain the guides to the engine block.

(4) Install the left side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

CAUTION: Overtightening the tensioner arm torx® bolt can cause severe damage to the cylinder head. Tighten torx® bolt to specified torque only.

(5) Install left side chain tensioner arm. Apply Mopar® Lock N, Seal to torx® bolt, tighten bolt to 17 N·m (150 in. lbs.).

(6) Install the right side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

(7) Install both secondary chains onto the idler sprocket. Align two plated links on the secondary chains to be visible through the two lower openings on the idler sprocket (4 o'clock and 8 o'clock). Once the secondary timing chains are installed, position special tool 8515 to hold chains in place for installation (Fig. 135).

(8) Align primary chain double plated links with the timing mark at 12 o'clock on the idler sprocket. Align the primary chain single plated link with the timing mark at 6 o'clock on the crankshaft sprocket (Fig. 133).

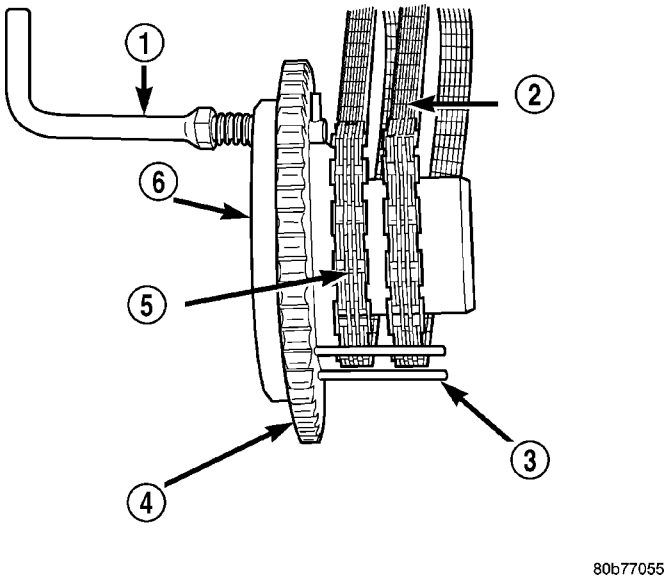

Fig. 135 Installing Secondary Timing Chains on Idler Sprocket

3 - SECONDARY CHAINS RETAINING PINS (4)
4 - IDLER SPROCKET
5 - LEFT CAMSHAFT CHAIN
6 - SPECIAL TOOL 8515

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(9) Lubricate idler shaft and bushings with clean engine oil.

(10) Install all chains, crankshaft sprocket, and idler sprocket as an assembly (Fig. 136). After guiding both secondary chains through the block and cylinder head openings, affix chains with a elastic strap or the equivalent, This will maintain tension on chains to aid in installation.

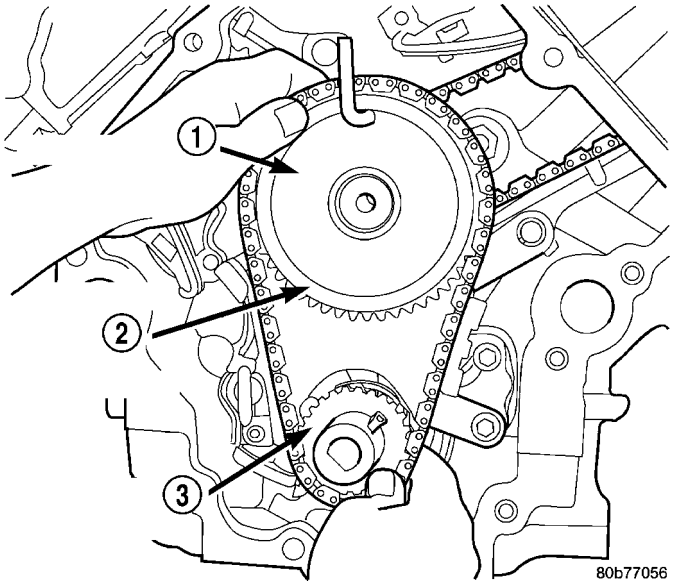

Fig. 136 Installing Idler Gear, Primary and Secondary Timing Chains

1 - SPECIAL TOOL 8515
2 - PRIMARY CHAIN IDLER SPROCKET
3 - CRANKSHAFT SPROCKET

NOTE: It will be necessary to slightly rotate camshafts for sprocket installation.

(11) Align left camshaft sprocket “L” dot to plated link on chain.

(12) Align right camshaft sprocket “R” dot to plated link on chain.

CAUTION: Remove excess oil from the camshaft sprocket bolt. Failure to do so can result in overtorque of bolt resulting in bolt failure.

(13) Remove Special Tool 8515, then attach both sprockets to camshafts. Remove excess oil from bolts, then Install sprocket bolts, but do not tighten at this time.

(14) Verify that all plated links are aligned with the marks on all sprockets and the “V8” marks on camshaft sprockets are at the 12 o'clock position (Fig. 133).

CAUTION: Ensure the plate between the left secondary chain tensioner and block is correctly installed.

(15) Install both secondary chain tensioners. Tighten bolts to 28 N·m (250 in. lbs.).

NOTE: Left and right secondary chain tensioners are not common.

(16) Before installing idler sprocket bolt, lubricate washer with oil, and tighten idler sprocket assembly retaining bolt to 34 N·m (25 ft. lbs.).

(17) Remove all locking pins (3) from tensioners.

CAUTION: After pulling locking pins out of each tensioner, DO NOT manually extend the tensioner(s) ratchet. Doing so will over tension the chains, resulting in noise and/or high timing chain loads.

(18) Using Special Tool 6958, Spanner with Adaptor Pins 8346, tighten left (Fig. 137) and right (Fig. 138). camshaft sprocket bolts to 122 N·m (90 ft. lbs.).

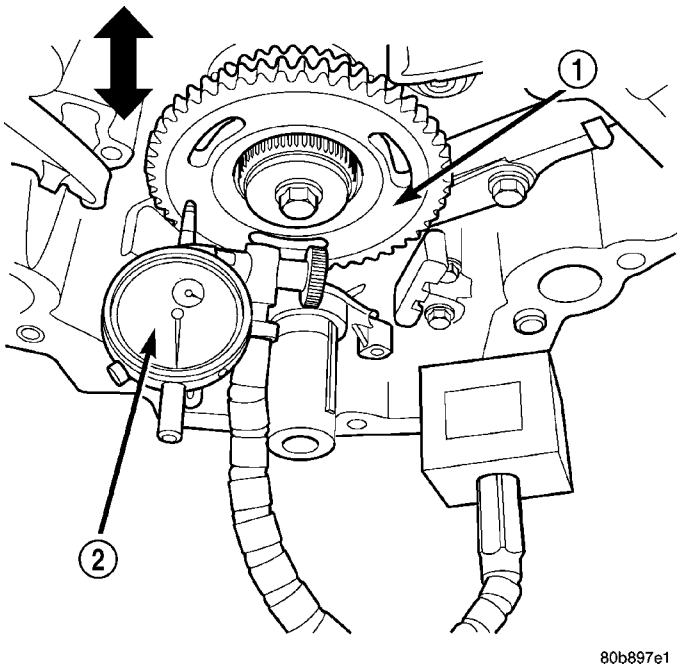

Fig. 139 Measuring Idler Gear End Play

1 - IDLER SPROCKET ASSEMBLY
2 - DIAL INDICATOR

(19) Rotate engine two full revolutions. Verify timing marks are at the follow locations:

- primary chain idler sprocket dot is at 12 o'clock (Fig. 133)
- primary chain crankshaft sprocket dot is at 6 o'clock (Fig. 133)
- secondary chain camshaft sprockets "V8" marks are at 12 o'clock (Fig. 133)

(20) Lubricate all three chains with engine oil.

(21) After installing all chains, it is recommended that the idler gear end play be checked (Fig. 139). The end play must be within 0.10–0.25 mm (0.004–0.010 in.). If not within specification, the idler gear must be replaced.

(22) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION) and crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(23) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

NOTE: Before installing threaded plug in right cylinder head, the plug must be coated with sealant to prevent leaks.

(24) Coat the large threaded access plug with **Mopar® Thread Sealant with Teflon**, then install into the right cylinder head and tighten to 81 N·m (60 ft. lbs.) (Fig. 128).

(25) Install the oil fill housing.

(26) Install access plug in left cylinder head (Fig. 128).

(27) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

(28) Install radiator fan shroud.

(29) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(30) Connect negative cable to battery.

IDLER SHAFT

REMOVAL

(1) Remove the primary and secondary timing chains and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

NOTE: To remove the idler shaft, it is necessary to tap threads into the shaft, to install the removal tool.

(2) Using a 12 mm X 1.75 tap, cut threads in the idler shaft center bore.
(3) Cover the radiator core with a suitable cover.

CAUTION: Use care when removing the idler shaft, Do not strike the radiator cooling fins with the slide hammer.

(4) Using Special Tool 8517 Slide Hammer, remove the idler shaft.

INSTALLATION

(1) Thoroughly clean the idler shaft bore.
(2) Position the idler shaft in the bore.

NOTE: The two lubrication holes in the idler shaft do not require any special alignment.

NOTE: Before using the retaining bolt to install the idler shaft, coat the threads and the pilot on the idler shaft, with clean engine oil.

(3) Using the primary idler sprocket retaining bolt and washer, carefully draw the idler shaft into the bore until fully seated.
(4) Coat the idler shaft with clean engine oil.
(5) Install the timing chains and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

ENGINE - 5.7L

DESCRIPTION

The 5.7L engine (Fig. 1)(345 CID) eight-cylinder engine is a 90° V-Type lightweight, deep skirt cast iron block, aluminum heads, single cam, overhead valve engine with hydraulic roller tappets. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE

DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) - PERFORMANCE and (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—MECHANICAL for possible causes and corrections of malfunctions. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING) and (Refer to 14 - FUEL SYSTEM/FUEL INJECTION - DIAGNOSIS AND TESTING) for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Engine Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING).
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery	1. Charge or replace as necessary.
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals.
	3. Faulty starter.	3. (Refer to 8 - ELECTRICAL/ STARTING - DIAGNOSIS AND TESTING).
	4. Faulty coil or control unit.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	5. Incorrect spark plug gap.	5. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	6. Dirt or water in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump, relay or wiring.	7. Repair or replace as necessary.

ENGINE - 5.7L (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE STALLS OR ROUGH IDLE	1. Idle speed set to low.	1. (Refer to 14 - FUEL SYSTEM/ FUEL INJECTION/IDLE AIR CONTROL MOTOR - REMOVAL).
	2. Idle mixture too lean or too rich.	2. Refer to Powertrain Diagnosis Information.
	3. Vacuum leak.	3. Inspect intake manifold and vacuum hoses, repair or replace as necessary.
	4. Faulty coil.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	5. Incorrect engine timing.	5. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
1. ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Dirt or water in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL PUMP - DIAGNOSIS AND TESTING).
	4. Blown cylinder head gasket.	4. Replace cylinder head gasket.
	5. Low compression.	5. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
	6. Burned, warped or pitted valves.	6. Replace as necessary.
	7. Plugged or restricted exhaust system.	7. Inspect and replace as necessary.
	8. Faulty coil.	8. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
1. ENGINE MISSES ON ACCELERATION	1. Spark plugs dirty or incorrectly gapped.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Dirt in fuel system.	2. Clean fuel system.
	3. Burned, warped or pitted valves.	3. Replcae as necessary.
	4. Faulty coil.	4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
1. ENGINE MISSES AT HIGH SPEED	1. Spark plugs dirty or incorrectly gapped.	1. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING).
	2. Faulty coil.	2. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL).
	3. Dirt or water in fuel system.	3. Clean system and replace fuel filter.

ENGINE - 5.7L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE)
	8. Excessive runout of valve seats on valve faces.	8. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE)
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of round.	6. Service or replace crankshaft.
	7. Loose flywheel or torque converter.	7. Tighten to correct torque

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs.

(3) Disable the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DESCRIPTION).

(4) Remove the ASD relay (Refer to 8 - ELECTRICAL/IGNITION CONTROL/AUTO SHUT DOWN RELAY - REMOVAL).

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

(7) (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner hose.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression,While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE - 5.7L (Continued)

DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS - LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-Rings. (a) Misaligned or damaged. (b) Loose fasteners, broken or porous metal parts. 2. Crankshaft rear seal 3. Crankshaft seal flange. Scratched, nicked or grooved. 4. Oil pan flange cracked. 5.Front cover seal, damaged or misaligned. 6. Scratched or damaged vibration damper hub. 7. Crankshaft Rear Flange Microporosity	1. (a) Replace as necessary. (b) Tighten fasteners, Repair or replace metal parts. 2. Replace as necessary. 3. Polish or replace crankshaft. 4. Replace oil pan. 5. Replace seal. 6. Polish or replace damper. 7. Replace Crankshaft
OIL PRESSURE DROP	1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pickup tube loose or damaged.	1. Check and correct oil level. 2. Replace sending unit. 3. Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Replace oil pump. 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals.	1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

ENGINE - 5.7L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - MECHANICAL

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase	1. Check for correct oil level. Adjust oil level by draining or adding as needed
	2. Thin or diluted oil	2. Change oil. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE)
	3. Low oil pressure	3. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) for engine oil pressure test/ specifications
	4. Dirt in tappets/lash adjusters	4. Clean/replace hydraulic tappets/lash adjusters
	5. Bent push rod(s)	5. Install new push rods
	6. Worn rocker arms	6. Inspect oil supply to rocker arms and replace worn arms as needed
	7. Worn tappets/lash adjusters	7. Install new hydraulic tappets/lash adjusters
	8. Worn valve guides	8. Inspect all valve guides and replace as necessary
	9. Excessive runout of valve seats or valve faces	9. Grind valves and seats
CONNECTING ROD NOISE	1. Insufficient oil supply	1. Check engine oil level.
	2. Low oil pressure	2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) engine oil pressure test/specifications
	3. Thin or diluted oil	3. Change oil to correct viscosity. (Refer to 9 - ENGINE/ LUBRICATION/OIL - STANDARD PROCEDURE) for correct procedure/engine oil specifications
	4. Excessive connecting rod bearing clearance	4. Measure bearings for correct clearance with plasti-gage. Repair as necessary
	5. Connecting rod journal out of round	5. Replace crankshaft or grind journals
	6. Misaligned connecting rods	6. Replace bent connecting rods

ENGINE - 5.7L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply	1. Check engine oil level.
	2. Low oil pressure	2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)
	3. Thin or diluted oil	3. Change oil to correct viscosity.
	4. Excessive main bearing clearance	4. Measure bearings for correct clearance. Repair as necessary
	5. Excessive end play	5. Check crankshaft thrust bearing for excessive wear on flanges
	6. Crankshaft main journal out of round or worn	6. Grind journals or replace crankshaft
	7. Loose flywheel or torque converter	7. Inspect crankshaft, flexplate/ flywheel and bolts for damage. Tighten to correct torque
LOW OIL PRESSURE	1. Low oil level	1. Check oil level and fill if necessary
	2. Faulty oil pressure sending unit	2. Install new sending unit
	3. Clogged oil filter	3. Install new oil filter
	4. Worn oil pump	4. Replace oil pump assembly.
	5. Thin or diluted oil	5. Change oil to correct viscosity.
	6. Excessive bearing clearance	6. Measure bearings for correct clearance
	7. Oil pump relief valve stuck	7. Remove valve to inspect, clean and reinstall
	8. Oil pickup tube loose, broken, bent or clogged	8. Inspect oil pickup tube and pump, and clean or replace if necessary
	9. Oil pump cover warped or cracked	9. Install new oil pump
OIL LEAKS	1. Misaligned or deteriorated gaskets	1. Replace gasket
	2. Loose fastener, broken or porous metal part	2. Tighten, repair or replace the part
	3. Front or rear crankshaft oil seal leaking	3. Replace seal
	4. Leaking oil gallery plug or cup plug	4. Remove and reseal threaded plug. Replace cup style plug

ENGINE - 5.7L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. CCV System malfunction	1. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS - DESCRIPTION) for correct operation
	2. Defective valve stem seal(s)	2. Repair or replace seal(s)
	3. Worn or broken piston rings	3. Hone cylinder bores. Install new rings
	4. Scuffed pistons/cylinder walls	4. Hone cylinder bores and replace pistons as required
	5. Carbon in oil control ring groove	5. Remove rings and de-carbon piston
	6. Worn valve guides	6. Inspect/replace valve guides as necessary
	7. Piston rings fitted too tightly in grooves	7. Remove rings and check ring end gap and side clearance. Replace if necessary

STANDARD PROCEDURE

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

REMOVAL

(1) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the battery negative cable.

(3) Remove the air cleaner resonator and duct work as an assembly.

(4) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

ENGINE - 5.7L (Continued)

(6) Remove the viscous fan/drive (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(7) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
(8) Remove the upper crossmember and top core support.

NOTE: It is not necessary to drain A/C system for engine removal.

(9) Remove the A/C compressor with the lines attached. Secure compressor out of the way.
(10) Remove generator assembly (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
(11) Remove the intake manifold and IAFM as an assembly(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(12) Disconnect the heater hoses.

NOTE: It is not necessary to disconnect P/S hoses from pump, for P/S pump removal.

(13) Remove the power steering pump and set aside.
(14) Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
(15) Raise and support the vehicle on a hoist and drain the engine oil.
(16) Remove engine front mount thru-bolt nuts.
(17) Remove right side axle retaining bolts.
(18) Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.
(19) Disconnect exhaust pipe at manifolds.
(20) Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
(21) Remove the structural dust cover and transmission inspection cover,(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).
(22) Remove drive plate to converter bolts (Automatic transmission equipped vehicles).
(23) Remove transmission bell housing to engine block bolts.
(24) Lower the vehicle.
(25) Install engine lift fixture, special tool # 8984.
(26) Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

INSTALLATION

(1) Install engine lift fixture Special tool # 8984.
(2) Position the engine in the engine compartment.
(3) Lower engine into compartment and align engine with transmission:

- Manual Transmission: Align clutch disc assembly (if disturbed). Install transmission input shaft into clutch disc while mating engine and transmission surfaces. Install two transmission to engine block mounting bolts finger tight.
- Automatic Transmission: Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.

(4) Position the thru-bolt into the support cushion brackets.
(5) Lower engine assembly until engine mount through bolts rest in mount perches.
(6) Install remaining transmission to engine block mounting bolts and tighten.
(7) Tighten engine mount through bolts.
(8) Install drive plate to torque converter bolts. (Automatic transmission models)
(9) Install the structural dust cover and transmission dust cover,(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).
(10) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).
(11) Install exhaust pipe to manifold.
(12) Lower the vehicle.
(13) Remove engine lift fixture, special tool # 8984.
(14) Connect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
(15) Reinstall the power steering pump.
(16) Connect the heater hoses.
(17) Install the intake manifold.
(18) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).
(19) Install the generator and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
(20) Install a/c compressor and lines (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).
(21) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(22) Install upper radiator support crossmember.
(23) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).
(24) Connect the radiator lower hose.
(25) Connect the transmission oil cooler lines to the radiator.
(26) Install the fan shroud.
(27) Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(28) Connect the radiator upper hose.
(29) Install the washer bottle.
(30) Connect the transmission cooler lines.

ENGINE - 5.7L (Continued)

(31) Install the air cleaner resonator and duct work..
(32) Add engine oil to crankcase (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).
(33) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(34) Connect battery negative cable.
(35) Start engine and inspect for leaks.
(36) Road test vehicle.

SPECIFICATIONS

5.7L ENGINE

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION
Engine Type	90° V-8 OHV
Displacement	5.7 Liters 345 (Cubic Inches)
Bore	99.5 mm (3.91 in.)
Stroke	90.9 mm (3.58 in.)
Compression Ratio	9.6:1
Firing Order	1-8-4-3-6-5-7-2
Lubrication	Pressure Feed - Full Flow Filtration
Cooling System	Liquid Cooled - Forced Circulation
Cylinder Block	Cast Iron
Cylinder Head	Aluminum
Crankshaft	Nodular Iron
Camshaft	Hollow Assembled Camshaft
Pistons	Aluminum Alloy
Connecting Rods	Powdered Metal

AIR INTAKE SYSTEM

REMOVAL

Filter Element Only

Housing removal is not necessary for element (filter) replacement.

(1) Loosen clamp (Fig. 2) and disconnect air duct at air cleaner cover.

(2) Pry over 4 spring clips (Fig. 2) from housing cover (spring clips retain cover to housing).

(3) Release housing cover from locating tabs on housing (Fig. 2) and remove cover.

(4) Remove air cleaner element (filter) from housing.

(5) Clean inside of housing before replacing element.

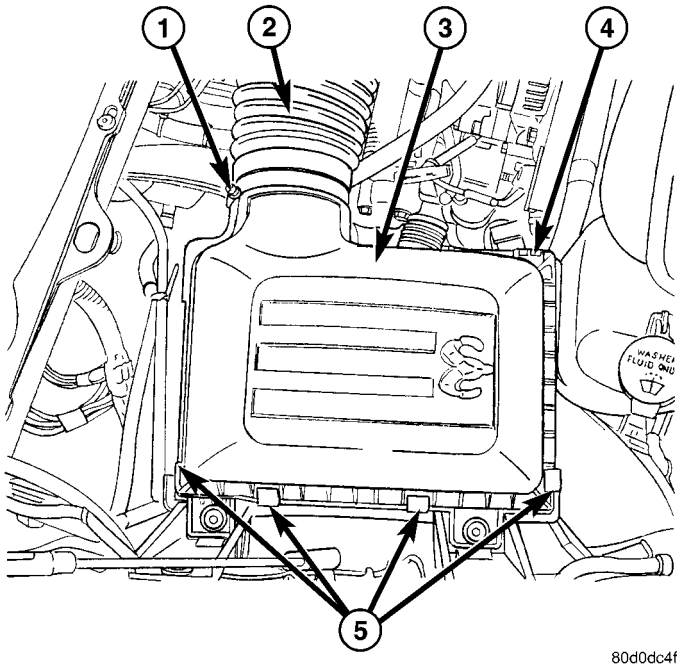

Fig. 2 AIR CLEANER HOUSING COVER

1 - CLAMP
2 - AIR DUCT
3 - AIR CLEANER COVER
4 - LOCATING TABS
5 - CLIPS (4)

Housing Assembly

(1) Loosen clamp (Fig. 2) and disconnect air duct at air cleaner cover.

(2) Lift entire housing assembly from 4 locating pins (Fig. 3).

INSTALLATION

(1) Install filter element into housing.

(2) Position housing cover into housing locating tabs (Fig. 2).

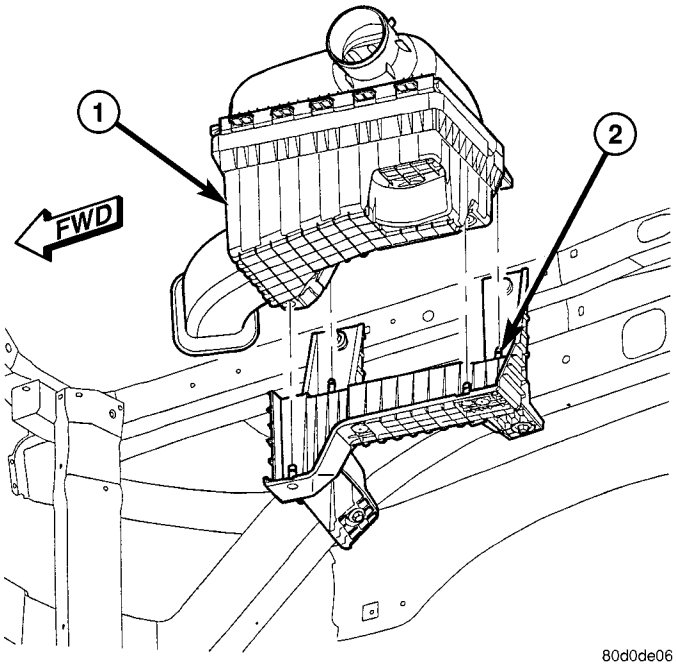

Fig. 3 AIR CLEANER HOUSING

1 - AIR CLEANER HOUSING ASSEMBLY
2 - LOCATING PINS (4)

(3) Pry up 4 spring clips (Fig. 2) and lock cover to housing.

(4) Install air duct to air cleaner cover and tighten hose clamp to 3 N·m (30 in. lbs.) torque.

(5) If any other hose clamps were removed from air intake system, tighten them to 3.4 N·m (30 in. lbs.) torque.

(6) If any bolts were removed from air resonator housing or air intake tubing, tighten them to 4.5 N·m (40 in. lbs.) torque.

CYLINDER HEAD

OPERATION—CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

CYLINDER HEAD (Continued)

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

(1) Disconnect the battery negative cable.
(2) Drain cooling system.
(3) Remove the air cleaner resonator and duct work.
(4) Remove the generator.
(5) Remove closed crankcase ventilation system.
(6) Disconnect the evaporation control system.
(7) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
(8) Disconnect heater hoses.
(9) Remove cylinder head covers and gaskets.
(10) Remove intake manifold and throttle body as an assembly.
(11) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.
(12) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

(1) Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
(2) Inspect the valve seats for damage. Service the valve seats as necessary.
(3) Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
(4) Inspect pushrods. Replace worn or bent pushrods.

INSTALLATION

(1) Clean all surfaces of cylinder block and cylinder heads.
(2) Clean cylinder block front and rear gasket surfaces using a suitable solvent.

CAUTION: The head gaskets are not interchangeable between left and right sides. They are marked "L" and "R" to indicate left and right sides.

(3) Position new cylinder head gaskets onto the cylinder block.

CYLINDER HEAD (Continued)

CAUTION: The head gaskets are marked "TOP" to indicate which side goes up.

(4) Position cylinder heads onto head gaskets and cylinder block.

(5) Tighten the cylinder head bolts in three steps (Fig. 4):

- Step 1— Snug tighten M12 cylinder head bolts, in sequence, to 34 N·m (25 ft. lbs.) and M8 bolts to 20 N·m (15 ft. lbs.) torque.
- Step 2— Tighten M12 cylinder head bolts, in sequence, to 54 N·m (40 ft. lbs.) and verify M8 bolts to 20 N·m (15 ft. lbs.) torque..
- Step 3— Turn M12 cylinder head bolts, in sequence, 90 degrees and tighten M8 bolts to 34 N·m (25 ft. lbs.) torque.

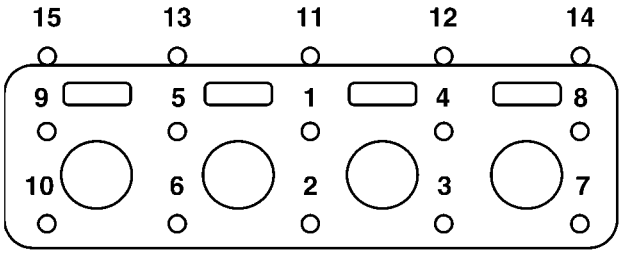

Fig. 4 CYLINDER HEAD TIGHTENING SEQUENCE

(6) Install push rods and rocker arm assemblies in their original position.

(7) Install the intake manifold and throttle body assembly.

(8) If required, adjust spark plugs to specifications. Install the plugs.

(9) Connect the heater hoses.

(10) Install the fuel supply line.

(11) Install the generator and drive belt.

(12) Install cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Connect the evaporation control system.

(14) Install the air cleaner.

(15) Fill cooling system.

(16) Connect the negative cable to the battery.

(17) Start engine check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

(1) Disconnect battery negative cable.

(2) Disconnect coil on plug connectors.

CAUTION: The ground straps must be installed in the same location as removed. The covers are machined to accept the ground straps in those locations only.

(3) Remove cylinder head cover retaining bolts, and ground straps.

(4) Remove cylinder head cover.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

INSTALLATION

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: DO NOT allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.

(2) Install cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location and install left and right ground straps.

CAUTION: The ground straps must be installed in the same location as removed. The covers are machined to accept the ground straps in those locations only.

NOTE: The right hand ground strap is located on the front inboard stud. The left hand ground strap is located on the rear inboard stud.

(3) Tighten cylinder head cover bolts and double ended studs to 8 N·m (70 in. lbs). Begin torque sequence in the middle of head cover and torque bolts moving outward in a crisscross pattern from top to bottom.

(4) Install ignition coil on plug, and torque fasteners to 12 N·m (105 in. lbs)

(5) Connect, ignition coil electrical connectors.

(6) Install PCV hose.

(7) Connect battery negative cable.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

DESCRIPTION - VALVE GUIDES

The valve guides are made of powered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

DESCRIPTION

Both the intake and exhaust valves are made of steel. The intake valve is 50.93 mm (2.00 inches) in diameter and the exhaust valve is 39.53 mm (1.55 inches) in diameter. All valves use three bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE - REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(1) Using a suitable dial indicator measure the center of the valve seat Total run out must not exceed 0.051 mm (0.002 in).

(2) Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.

(3) When the seat is properly positioned the width of the intake seat must be 1.018 - 1.62 mm (0.0464 - 0.0637 in.) and the exhaust seat must be 1.48 - 1.92 mm (0.058 - 0.075 in.).

(4) Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 46.0 mm (1.81 in.).

VALVE FACE AND VALVE SEAT ANGLE CHART

DESCRIPTION	SPECIFICATION
SEAT WIDTH	
INTAKE	1.018 - 1.62 mm (0.0464 - 0.0637 in.)
EXHAUST	1.48 - 1.92 mm (0.058 - 0.075 in.)
FACE ANGLE (INT. AND EXT.)	45° - 45½°
SEAT ANGLE (INT. AND EXT.)	44½° - 45°

(5) The valve seat must maintain an angle of 44.5 – 45.0 degrees angle.

(6) The valve face must maintain a face angle of 45.0 – 45.5 degrees angle (Fig. 5).

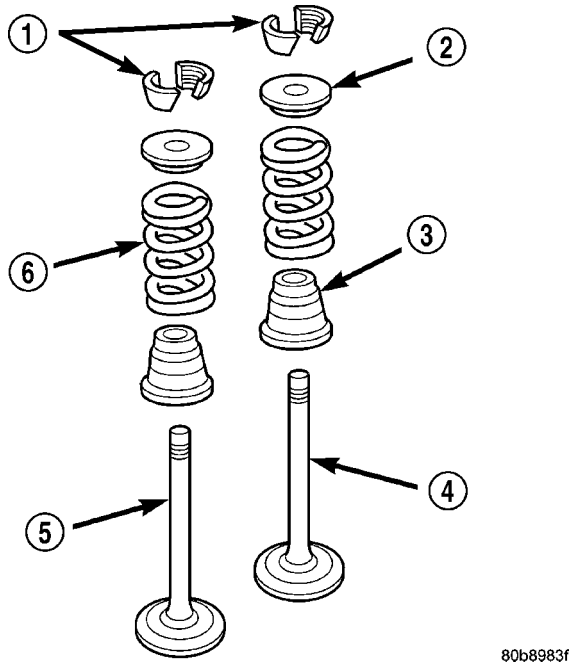

Fig. 5 Valve Assembly Configuration

1 - VALVE LOCKS (3–BEAD)
2 - RETAINER
3 - VALVE STEM OIL SEAL
4 - INTAKE VALVE
5 - EXHAUST VALVE
6 - VALVE SPRING

INTAKE/EXHAUST VALVES & SEATS (Continued)

REMOVAL

(1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Compress valve springs using Valve Spring Compressor Tool special tool # C-3422and adapter 8464.

(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Coat valve stems with lubrication oil and insert them in cylinder head.

(5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.

(6) Install new seals on all valve guides. Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool special tool # C- 3422and adapter 8464, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer.

(8) Install cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - INSTALLATION).

ROCKER ARM / ADJUSTER ASSY

REMOVAL

(1) Remove cylinder head cover.(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Loosen the rocker shafts using the following sequence: **Center, center-left, center-right, left, right,**.

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".

(3) Remove the rocker shafts. Note location for reassembly.

CAUTION: The longer push rods are for the exhaust side, and the shorter push rods are for intake side.

(4) Remove the pushrods. Note pushrod location for reassembly.

INSTALLATION

CAUTION: The longer push rods are for the exhaust side, and the shorter push rods are for intake side.

(1) Install the push rods in the same order as removed.

CAUTION: Verify that pushrod is installed into rocker arm and lifter correctly while installing rocker shaft assembly. Recheck after rocker shaft has been torqued to specification.

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with the letter "I".

(2) Install rocker shaft assemblies in the same order as removed.

CAUTION: Ensure that hold downs and rocker arms are not overlapped when torquing bolts.

(3) Tighten the rocker shaft bolts to 22 N·m (195 in. lbs.) torque,using the following sequence: **Center, center-right, center-left, right, left** .

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(4) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVE STEM SEALS

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

VALVE SPRINGS

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove air cleaner assembly.
(3) Remove air intake resonator.
(4) Remove spark plug cables.
(5) Remove ignition coil connectors (Fig. 6).

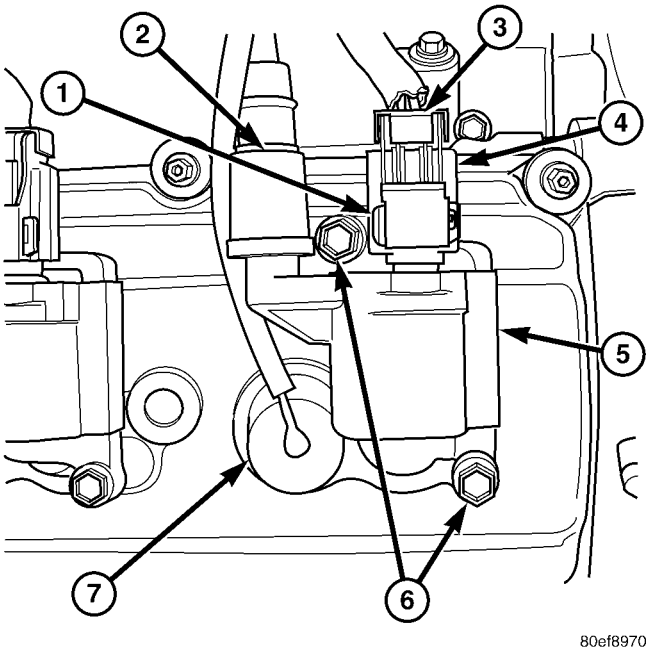

Fig. 6 IGNITION COIL R/I — 5.7L V-8

1 - SLIDE LOCK (SLIDE OUTWARD TO UNLOCK)
2 - SPARK PLUG CABLE (TO OPPOSITE CYLINDER BANK SPARK PLUG)
3 - RELEASE LOCK / TAB (PUSH HERE)
4 - ELEC. CONNECTOR
5 - IGNITION COIL
6 - COIL MOUNTING BOLTS (2)
7 - SPARK PLUG CABLE (TO OPPOSITE CYLINDER BANK IGNITION COIL)

(6) Remove ignition coils.
(7) Remove one spark plug.
(8) Remove valve cover.

CAUTION: The piston must be at TDC, and both valves closed on the cylinder to be serviced.

NOTE: If removing intake valve spring, install special tool# 9070, pushrod retaining plate, to retain the intake pushrods.

(9) Remove exhaust/intake rocker arm shafts.
(10) Install spring compressor, special tool# 9065.

NOTE: All valve springs and seals are removed in the same manner.

(11) Charge cylinder with air.

NOTE: Tap the top of the valve spring retainer to loosen the spring retainers locks.

(12) Compress valve spring and remove valve retainer locks.
(13) Release spring compressor and remove valve spring.

NOTE: The valve springs are interchangeable between intake and exhaust.

(14) Remove valve seal.

INSTALLATION

(1) Install valve seal.
(2) Install valve spring.
(3) Using special tool# 9065, compress valve spring and install valve spring retainer and locks.
(4) Release air charge in cylinder.
(5) Remove spring compressor tool # 9065.

CAUTION: Verify that the pushrods are fully seated into lifter and rocker arm. Recheck after rocker arm shaft has been torqued to specification.

(6) Install rocker arm shaft and pushrods(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
(7) Tighten the rocker shaft bolts to 22 N·m (195 in. lbs.) torque,using the following sequence: **Center, center-right, center-left, right, left** .
(8) Remove special tool# 9070, pushrod retaining plate, if used.
(9) Install cylinder head cover.
(10) Tighten cylinder head cover bolts and double ended studs(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
(11) Install spark plugs.
(12) Install ignition coil on plug, and torque fasteners to 12 N·m (105 in. lbs)
(13) Install ignition coil connectors.
(14) Install spark plug cables.
(15) Install air intake resonator.
(16) Install air cleaner assembly.
(17) Connect negative battery cable.

ENGINE BLOCK

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the 1/4 inch NPT plugs to 20 N·m (177 in. lbs.) torque. Tighten the 3/8 inch NPT plugs to 27 N·m (240 in. lbs.) torque.

INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer (Fig. 7).

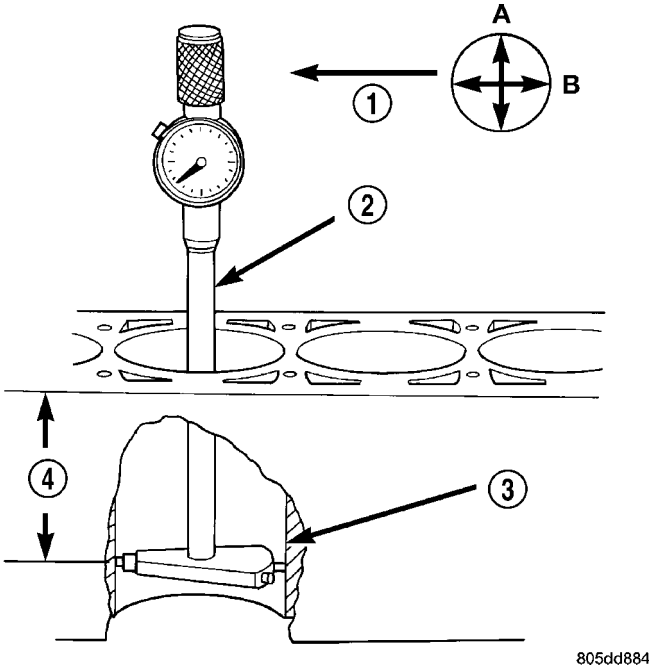

Fig. 7 BORE GAUGE-TYPICAL

1 - FRONT
2 - BORE GAUGE
3 - CYLINDER BORE
4 - 38 MM (1.5 in)

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL

REMOVAL - CAMSHAFT CORE HOLE PLUG

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

(1) Remove the rear cam bearing core plug.

REMOVAL - CAMSHAFT

(1) Remove the battery negative cable.
(2) Remove the air cleaner assembly.
(3) Drain coolant.
(4) Remove the accessory drive belt.
(5) Remove the generator.
(6) Remove the A/C compressor, and set aside
(7) Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
(8) Remove intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(9) Remove cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(10) Remove both left and right cylinder heads(Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) .
(11) Remove the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(12) Remove timing case cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(13) Remove the oil pick up tube.
(14) Remove the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(15) Remove timing chain(Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(16) Remove camshaft tensioner/thrust plate assembly.

NOTE: Identify tappets to ensure installation in original location.

(17) Remove the retainer assembly and tappets.

(18) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSPECTION

(1) The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason.

INSTALLATION

INSTALLATION - CAMSHAFT CORE HOLE PLUG

CAUTION: The new core hole plug must be installed to the proper depth or camshaft damage could develope. The plug must be installed squarely in the bore.

(1) Install a new core hole plug at the rear of camshaft, using special tool # 9048. Clean plug and apply mopar® lock and seal adhesive to the edge of the plug, before installing. The plug must be installed to a depth of + / - 0.25mm from the end of the machined bevel, that is the end of the bevel that is closest to the cam bearing.

INSTALLATION - CAMSHAFT

(1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft

(2) Install camshaft Tensioner plate assembly. Tighten bolts to 28 N·m (250 in. lbs.) torque.

(3) Install timing chain and sprockets(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(4) Measure camshaft end play(Refer to 9 - ENGINE - SPECIFICATIONS). If not within limits install a new thrust plate.

(5) Install the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(6) Install the oil pick up tube.

(7) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

(8) Install the tappets and retainer assembly(Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION).

(9) Install both left and right cylinder heads(Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION) .

(10) Install pushrods

(11) Install rocker arms(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(12) Install timing case cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(13) Install the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Install cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Install intake manifold(Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(16) Install the A/C compressor, and set aside

(17) Install the generator.

(18) Install the accessory drive belt.

(19) Install the radiator (Refer to 7 - COOLING/ ENGINE/RADIATOR - INSTALLATION).

(20) Install the air cleaner assembly.

(21) Install the battery negative cable.

(22) Refill coolant.

(23) Refill engine oil.

(24) Start engine and check for leaks.

CRANKSHAFT

REMOVAL

(1) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(2) Remove the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove the oil pump pickup.

(4) Remove the windage tray/oil pan gasket.

(5) Remove the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(6) Remove the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(7) Remove the timing drive(Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(8) Identify rod bearing caps before removal. Remove rod bearing caps with bearings.

(9) Identify main bearing caps before removal. Remove main bearing caps and bearings one at a time.

CRANKSHAFT (Continued)

(10) Remove the thrust washers.

(11) Remove the rear oil seal retainer(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINE - REMOVAL).

(12) Remove the crankshaft out of the block.

(13) Remove and discard the crankshaft rear oil seal.

(14) Remove and discard the front crankshaft oil seal.

INSTALLATION

(1) Select the proper main bearings(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) .

(2) Install main bearings in block and caps, and lubricate bearings.

(3) Position the crankshaft into the cylinder block.

(4) Install the thrust washers.

NOTE: The main cap crossbolts are torqued after final torque of the main cap bolts. Always use a new washer/seal on crossbolts.

(5) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten in two steps using the following sequence (Fig. 8).

- Step 1 – 27 N·m (20ft. lbs.) torque.
- Step 2 – Turn main cap bolts an additional 90°.

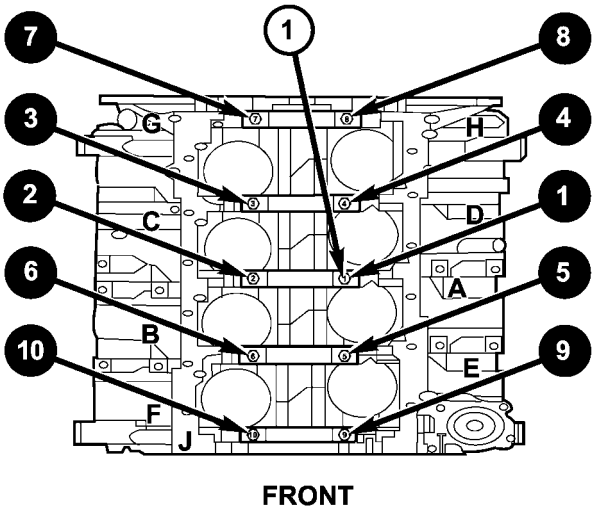

Fig. 8 MAINCAP TIGHTENING SEQUENCE

1 - Stud Location

(6) Install the crossbolts with new washer/gasket. Starting with crossbolt A (Fig. 8) torque each crossbolt to 28 N·m torque.

(7) Repeat crossbolt torque procedure.

(8) Measure crankshaft end play(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) .

(9) Position the connecting rods onto the crankshaft and install the rod bearing caps(Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSTALLATION).

(10) Install timing drive(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(11) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(12) Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(13) Install the rear main seal and retainer(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINE - INSTALLATION).

(14) Install the windage tray/oil pan gasket.

(15) Install the oil pick up tube.

(16) Install the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(17) Install the vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(18) Install the engine(Refer to 9 - ENGINE - INSTALLATION).

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crank-

shaft counterweight has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5.

NOTE: Service main bearings are coded. These codes identify what size (grade) the bearing is.

MAIN BEARING SELECTION CHART - 5.7L

GRADE MARKING	SIZE mm (in.)	FOR USE WITH JOURNAL SIZE
A	0.008 mm U/S (0.0004 in.) U/S	64.988–64.995 mm (2.5585– 2.5588in.)
B	NOMINAL	64.996–65.004 mm (2.5588–2.5592 in.)
C	0.008 mm O/S (0.0004 in.) O/S	65.005–65.012 mm (2.5592–2.5595 in.)

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 9).

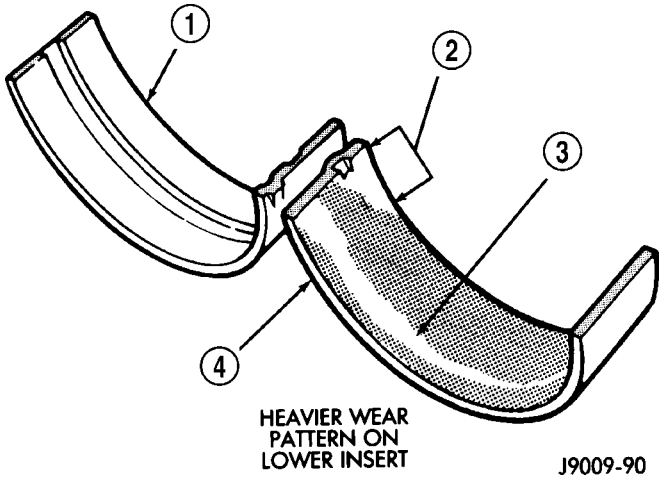

Fig. 9 Main Bearing Wear Patterns

1 - UPPER INSERT
2 - NO WEAR IN THIS AREA
3 - LOW AREA IN BEARING LINING
4 - LOWER INSERT

NOTE: If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Remove upper radiator hose.

(5) Remove radiator shroud attaching fasteners.

(6) Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(7) Remove crankshaft damper bolt.

(8) Remove damper using Special Tools 8513A Insert and 8454 Three Jaw Puller.

(9) Using Special Tool 9071, remove crankshaft front seal.

INSTALLATION

CAUTION: The front crankshaft seal must be installed dry. Do not apply lubricant to sealing lip or to outer edge.

(1) Using Special Tool 8348 and 8512A, install crankshaft front seal.

CAUTION: To prevent severe damage to the Crankshaft or Damper, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(2) Install vibration damper (Refer to 9 - ENGINE/ ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(3) Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(4) Install upper radiator hose.

(5) Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(7) Connect negative cable to battery.

CRANKSHAFT OIL SEAL - REAR

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.

(4) If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.

(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

REMOVAL

NOTE: This procedure can be performed in vehicle.

(1) If being preformed in vehicle, remove the transmission.

(2) Remove the flexplate (Refer to 9 - ENGINE/ ENGINE BLOCK/FLEX PLATE - REMOVAL).

NOTE: The crankshaft oil seal CAN NOT be reused after removal.

NOTE: The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.

(3) Using Special Tool 8506, remove the crankshaft rear oil seal.

INSTALLATION

CAUTION: The rear seal must be installed dry for proper operation. Do not lubricate the seal lip or outer edge.

(1) Position the plastic seal guide onto the crankshaft rear face. Then position the crankshaft rear oil seal onto the guide.

(2) Using Special Tools 8349 Crankshaft Rear Oil Seal Installer and C-4171 Driver Handle, with a hammer, tap the seal into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.

(3) Install the flexplate.

(4) Install the transmission.

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the transmission.

(3) Remove the drive plate / flywheel.

(4) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(5) Remove the rear oil seal retainer mounting bolts.

(6) Carefully remove the retainer from the engine block.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

INSTALLATION

(1) Throughly clean all gasket resdue from the engine block.
(2) Use extream care and clean all gasket resdue from the retainer.
(3) Position the gasket onto the retainer.
(4) Position the retainer onto the engine block.
(5) Install the retainer mounting bolts. Tighten the bolts to 15 N·m (132 in. lbs.) using a crisscross pattern, starting with the bolt on the lower right.
(6) Install a new rear seal(Refer to 9 - ENGINE/ ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).
(7) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
(8) Install the drive plate / flywheel.
(9) Install the transmission.
(10) Check and verify engine oil level.
(11) Start engine and check for leaks.

FLEX PLATE

REMOVAL

(1) Remove the transmission.
(2) Remove the bolts and flexplate.

INSTALLATION

(1) Position the flexplate or flywheel onto the crankshaft and install the bolts hand tight.
(2) **For automatic transmissions:** Tighten the flexplate retaining bolts to 95 N·m (70 ft. lbs.).
(3) **For manual transmissions:** Tighten the flywheel retaining bolts to 75 N·m (55 ft. lbs.).
(4) Install the transmission.

HYDRAULIC TAPPETS

DIAGNOSIS AND TESTING - HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-70 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.
(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.
(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

HYDRAULIC TAPPETS (Continued)

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Remove the air cleaner(Refer to 9 - ENGINE/ AIR INTAKE SYSTEM - REMOVAL).
(3) Remove intake manifold(Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(4) Remove cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(5) Remove rocker arm assembly and push rods(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify push rods to ensure installation in original location.
(6) Remove the cylinder head(Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
(7) Remove bolt from tappet guide holder.
(8) Remove tappet guide holder.
(9) Pull tappet out of bore with a twisting motion. If all tappets are to be removed and reused, identify tappets to ensure installation in original location.
(10) Check camshaft lobes for abnormal wear.

INSTALLATION

(1) Lubricate tappets.
(2) Install tappets in their original positions.
(3) Install tappet guide holder. Install the tappet guide holder bolt and tighten to 12 N·m (106 in. lbs.) torque.
(4) Install cylinder head(Refer to 9 - ENGINE/ CYLINDER HEAD - INSTALLATION).
(5) Install pushrods and rocker arm assembly(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
(6) Install cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
(7) Install intake manifold(Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
(8) Install the air cleaner(Refer to 9 - ENGINE/ AIR INTAKE SYSTEM - INSTALLATION).
(9) Connect the negative cable to the battery.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

(10) Road test vehicle and check for leaks.

PISTON & CONNECTING ROD

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal, with a “fractured cap” design. A pressed fit piston pin is used to attach the piston and connecting rod.

STANDARD PROCEDURE—PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
(2) Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 11).
(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. The piston-rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder bank (even numbered) and must not be interchanged.
(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 10). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

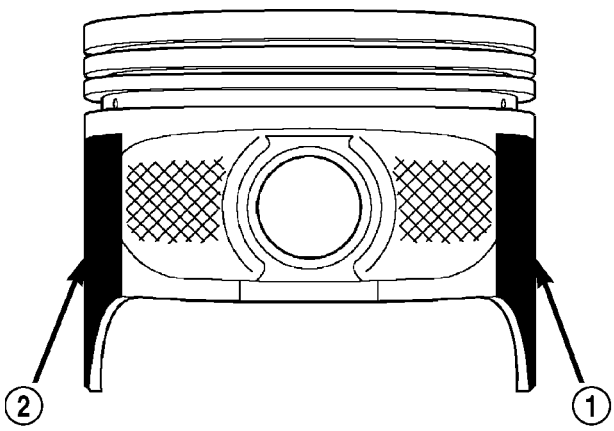

Fig. 10 MOLY COATED PISTON

1 - MOLY COATED
2 - MOLY COATED

PISTON & CONNECTING ROD (Continued)

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

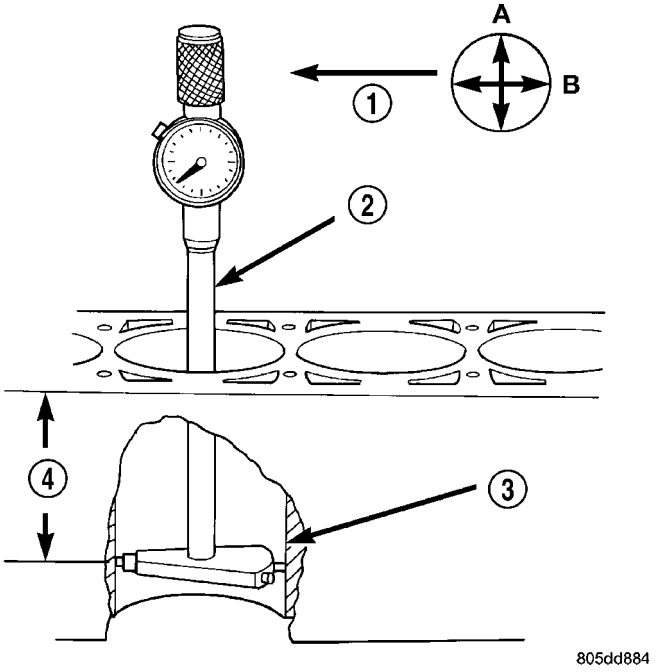

Fig. 11 BORE GAUGE - TYPICAL

1 - FRONT
2 - BORE GAUGE
3 - CYLINDER BORE
4 - 38 MM (1.5 in)

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the following components:

- Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- Timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

(4) Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool (Fig. 12).

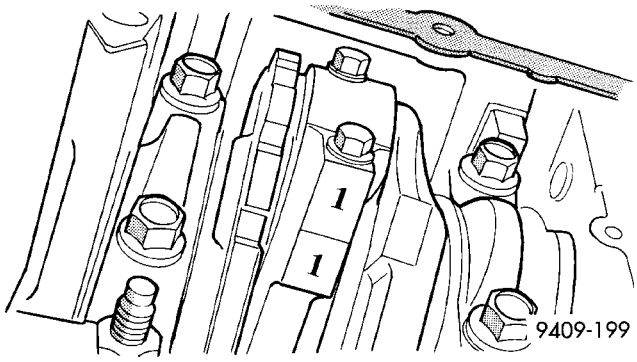

Fig. 12 IDENTIFY CONN ROD TO CYLINDER

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

(5) Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur

(6) Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

(7) Carefully remove piston rings from piston(s), starting from the top ring down.

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

(1) Using a suitable cleaning solvent clean the pistons in warm water and towel dry.

(2) Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.

PISTON & CONNECTING ROD (Continued)

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Before installing piston and connecting rod assemblies into the bore, install the piston rings(Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).

(2) Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**

(3) Position bearing onto connecting rod. Lubricate bearing surface with clean engine oil.

(4) Install Special Tool 8507 Connecting Rod Guides into connecting rod bolt threads.

(5) The pistons are marked on the piston pin bore surface with an raised “F” or arrow on top of piston indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks.

(6) Wipe cylinder bore clean and lubricate with engine oil.

(7) Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.

(8) Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

(9) Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 21 N·m (15 ft. lbs.) plus a 90° turn.

(10) Install the following components:

- Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- Install the intake manifold.
- Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Fill crankcase with proper engine oil to correct level.

(12) Connect negative cable to battery.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

(1) Wipe the cylinder bore clean.

(2) Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.

(3) Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.

(4) Using a feeler gauge check the ring end gap (Fig. 13). Replace any rings not within specification.

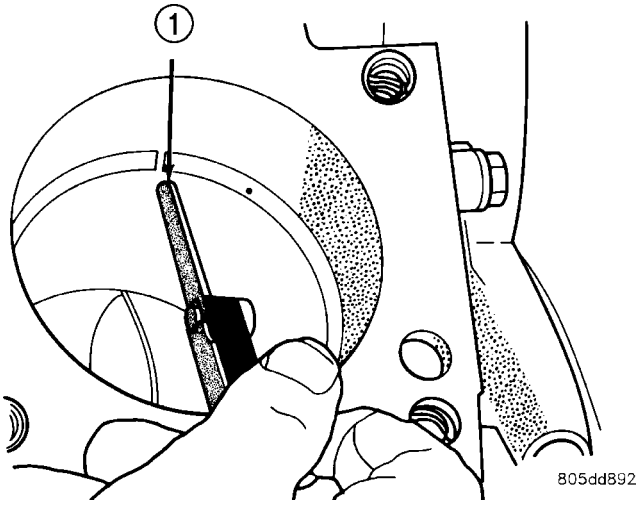

Fig. 13 Ring

1 - FEELER GAUGE

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

PISTON RINGS (Continued)

(5) Measure the ring side clearance as shown (Fig. 14)make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.

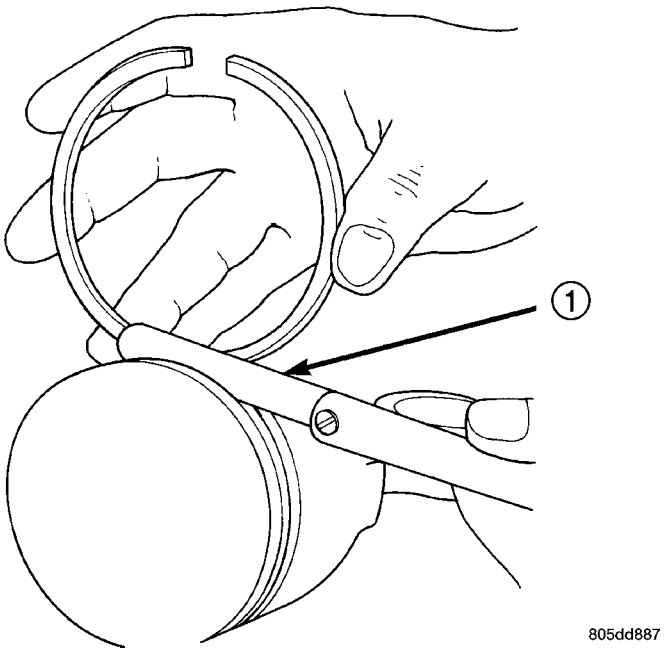

Fig. 14 Measuring Piston Ring Side Clearance

1 - FEELER GAUGE

(6) Rotate the ring around the piston, the ring must rotate in the groove with out binding.

PISTON RING SPECIFICATION CHART

Ring Position	Groove Clearance	Maximum Clearance
Upper Ring	0.6715-.0.7105mm (0.0264- 0.0279 in.)	0.11mm (0.004 in.)
Intermediate Ring	0.5455-0.6245mm (0.0214-0.0245 in.)	0.10mm (0.004 in.)
Ring Position	**Ring Gap**	**Wear Limit**
Upper Ring	0.23-0.38mm (0.0090-0.0149 in.)	0.43mm (0.017 in.)
Intermediate Ring	0.35-0.60mm (0.0137-0.0236 in.)	0.74mm (0.029 in.)
Oil Control Ring (Steel Rail)	0.015-0.66mm (0.0059- 0.0259 in.)	1.55mm (0.061 in.)

(7) The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

- **Oil ring expander.**
- **Lower oil ring side rail.**
- **Upper oil ring side rail.**
- **No. 2 Intermediate piston ring.**
- **No. 1 Upper piston ring.**

(8) Install the oil ring expander.

(9) Install upper side rail (Fig. 15) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

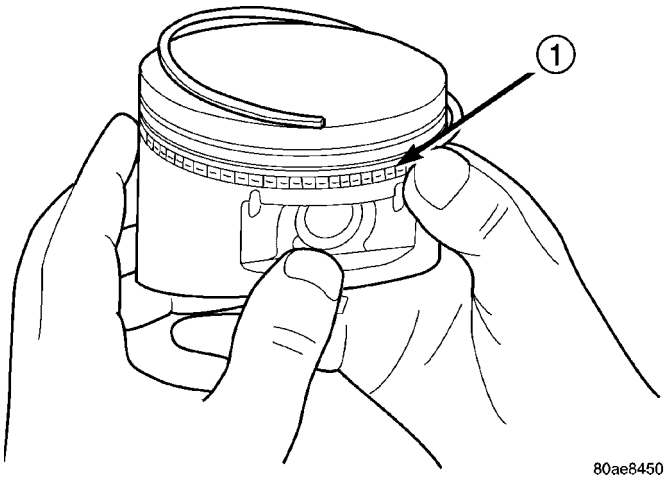

Fig. 15 SIDE RAIL - INSTALLATION

1 - SIDE RAIL END

PISTON RINGS (Continued)

(10) Install No. 2 intermediate piston ring using a piston ring installer (Fig. 16).

(11) Install No. 1 upper piston ring using a piston ring installer (Fig. 16).

(12) Position piston ring end gaps as shown in (Fig. 17). It is important that expander ring gap is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.

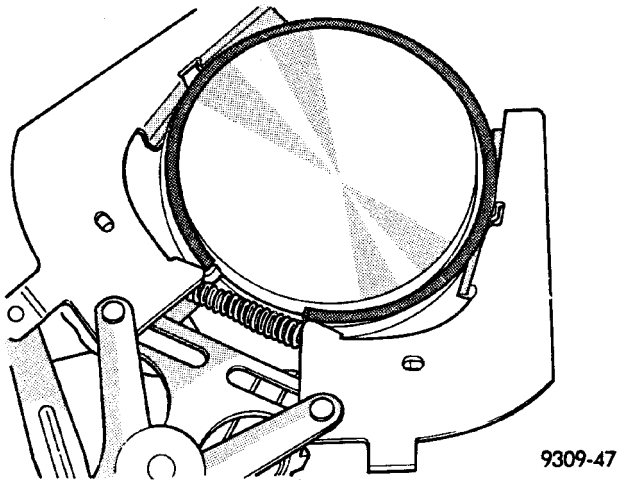

Fig. 16 UPPER AND INTERMEDIATE RINGS

5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Remove radiator upper hose.

(5) Remove upper fan shroud.

(6) Using Special Tools 6958 Spanner with Adapter Pins 8346, loosen fan and viscous assembly from water pump.

(7) Remove fan and viscous assembly.

(8) Remove crankshaft damper bolt.

(9) Remove damper using Special Tools 8513A Insert and 8454 Three Jaw Puller.

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512–A, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(1) Slide damper onto crankshaft slightly.

CAUTION: Special Tool 8512–A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

(2) Assemble Special Tool 8512–A as follows, The nut is threaded onto the shaft first. Then the roller bearing is placed onto the threaded rod (The hardened bearing surface of the bearing **MUST** face the nut). Then the hardened washer slides onto the threaded rod (Fig. 18). Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or (Loctite No. 771).

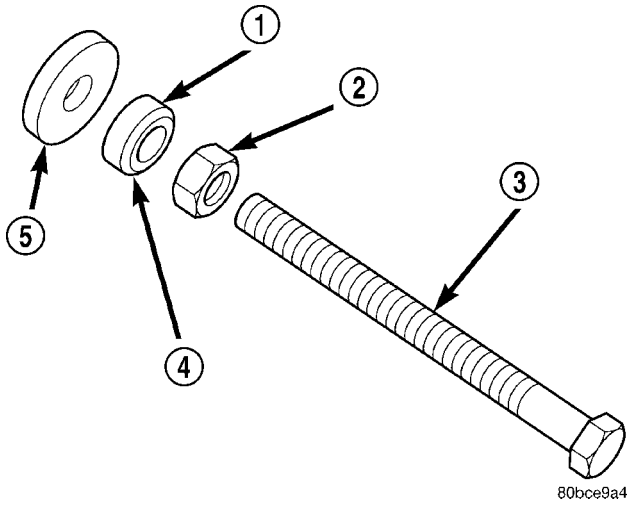

Fig. 18 Proper Assembly Method for Special Tool 8512

1 - BEARING
2 - NUT
3 - THREADED ROD
4 - BEARING HARDENED SURFACE (FACING NUT)
5 - HARDENED WASHER

VIBRATION DAMPER (Continued)

(3) Using Special Tool 8512–A, press damper onto crankshaft.

(4) Install then tighten crankshaft damper bolt to 176 N·m (129 ft. lbs.).

(5) Install fan blade assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(6) Install radiator upper shroud and tighten fasteners to 11 N·m (95 in. lbs.).

(7) Install radiator upper hose.

(8) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(10) Connect negative cable to battery.

STRUCTURAL COVER

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine.

OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

REMOVAL

(1) Raise vehicle on hoist.

CAUTION: On manual transmission vehicles, the 7/16 inch engine block to clutch housing bolts must be loosened before removal of the structural dust cover. Clutch housing distortion will occur if this procedure is not followed.

(2) Remove the bolts retaining structural cover.

(3) Remove the structural cover.

INSTALLATION

AUTOMATIC TRANSMISSION

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.

(1) Position the structural cover in the vehicle.

(2) Install all four bolts retaining the cover-to-engine. DO NOT tighten the bolts at this time.

(3) Install the four cover-to-transmission bolts. Do NOT tighten at this time.

CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.

(4) Torque the (4)structural dust cover bolts that go into the transmission to 6-11 N·m (50-100 in.lbs.).

(5) Torque the (4) structural dust cover bolts that go into the engine block to 6-11 N·m (50-100 in.lbs.).

(6) Starting with the two rear cover-to-engine bolts, tighten bolts (1) (Fig. 19) to 54 N·m (40 ft. lbs.), then tighten bolts (2) (Fig. 19) and (3) to 54 N·m (40 ft. lbs.) in the sequence shown.

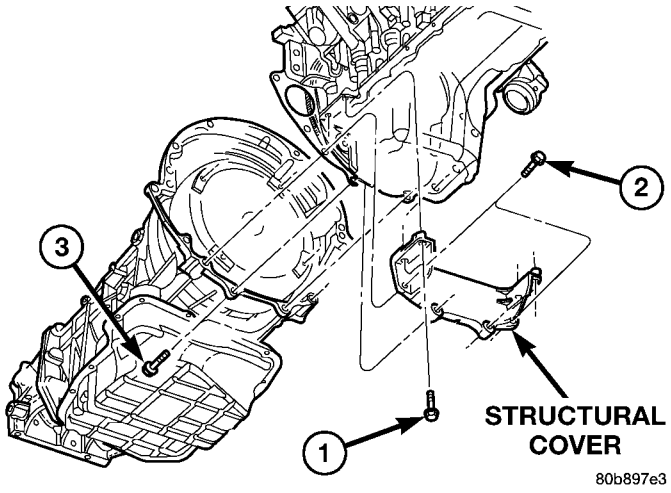

Fig. 19 Structural Cover

1 - BOLT
2 - BOLT
3 - BOLT

(7) Install the exhaust pipe on left hand exhaust manifold.

(8) Tighten exhaust manifold-to-exhaust pipe retaining bolts to 20–26 N·m (15–20 ft. lbs.).

MANUAL TRANSMISSION

CAUTION: The 7/16 inch engine block to clutch housing bolts must be loosened before removal/installation of the structural dust cover. Clutch housing distortion will occur if this procedure is not followed.

(1) Position the structural cover in the vehicle.

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover, and engine noise.

(2) Install all bolts retaining the cover-to-engine. DO NOT tighten the bolts at this time (Fig. 20).

(3) Install the cover-to-transmission bolts. Do NOT tighten at this time.

STRUCTURAL COVER (Continued)

CAUTION: The structural cover must be held tightly against the corner formed by the engine and the transmission clutch housing during tightening sequence. Failure to do so may cause damage to the cover and engine noise.

(4) Torque the (2)structural dust cover bolts that go into the clutch housing to 6-11 N·m (50-100 in.lbs.).

(5) Torque the (4) structural dust cover bolts that go into the engine block to 6-11 N·m (50-100 in.lbs.).

(6) Torque the structural cover bolt that is closest to the rear face of block on the passenger side of block to 54 N·m (40 ft. lbs.).

(7) Torque the structural cover bolt that is closest to the front face of block on the drivers side to 54 N·m (40 ft. lbs.).

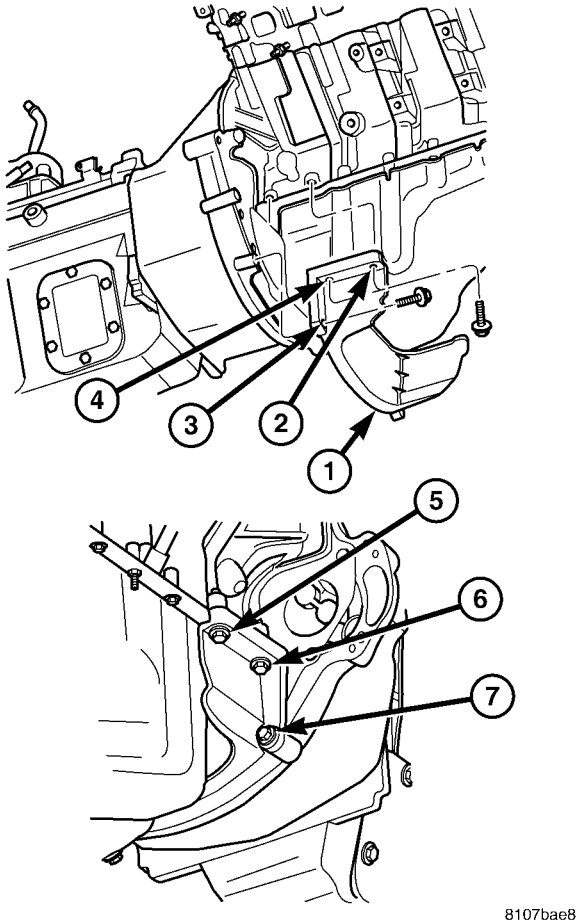

Fig. 20 Structural Cover - Manual Transmission

1 - STRUCTURAL COVER
2 - BOLT
3 - BOLT
4 - BOLT
5 - BOLT
6 - BOLT
7 - BOLT

(8) Torque the remaining (2) structural cover bolts that go into the **block** in an "X" pattern to 54 N·m (40 ft. lbs.).

(9) Torque the structural cover bolts that go into the **clutch housing** to 54 N·m (40 ft. lbs.).

(10) Torque the 7/16 inch engine block to clutch housing bolts to 68 N·m (50 ft. lbs.).

FRONT MOUNT

REMOVAL

2WD

(1) Disconnect negative battery cable.

(2) Raise vehicle.

(3) Remove engine mount through bolts.

(4) Raise engine using engine support fixture special tool # 8534.

(5) Remove engine mount to insulator bolts (Fig. 21), (Fig. 22).

(6) Remove insulator from engine.

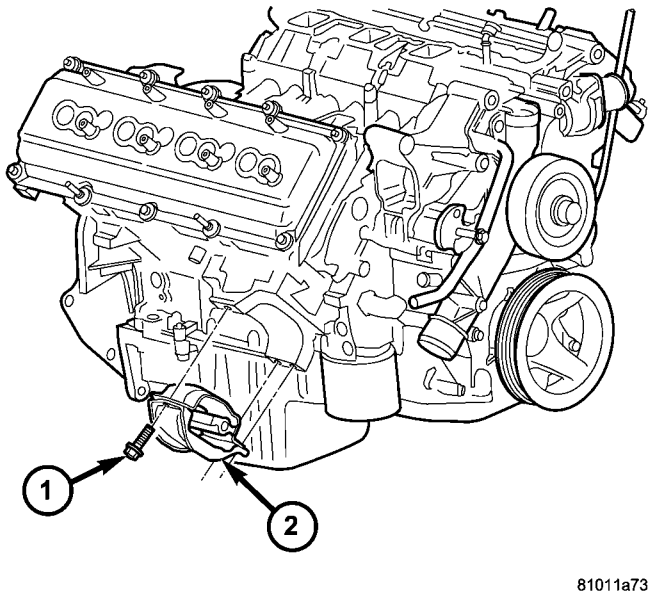

Fig. 21 RH INSULATOR

1 - BOLT
2 - INSULATOR

4WD

(1) Disconnect the negative cable from the battery.

(2) Raise the vehicle.

(3) Remove the skid plate.

(4) Remove the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - REMOVAL).

(5) Remove the engine oil filter.

FRONT MOUNT (Continued)

(6) Support the engine using engine support fixture, special tool # 8534.
(7) Support the front axle with a suitable jack.
(8) Remove the (4) bolts that attach the engine mounts to the front axle (Fig. 23).
(9) Remove the (3) bolts that attach the front axle to the left engine bracket.
(10) Lower the front axle.
(11) Remove the (6) through bolts
(12) Raise the engine far enough to be able to remove the left and right engine mounts.
(13) Remove the engine mounts.

INSTALLATION

2WD

(1) Install insulator on the engine (Fig. 24).

NOTE: For mount to engine block and left engine bracket to front axle bolts, apply Mopar® Lock and Seal Adhesive, Medium Strength Threadlocker.

(2) Install upper and lower mount mounting bolts. Tighten bolts to 61 N·m (45 ft. lbs.).

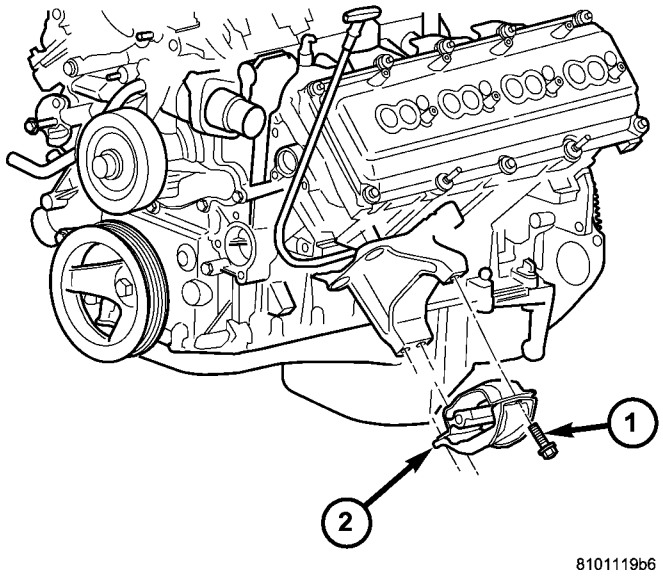

Fig. 22 LH INSULATOR

1 - BOLT
2 - INSULATOR

(3) Lower the engine using engine support fixture special tool # 8534.

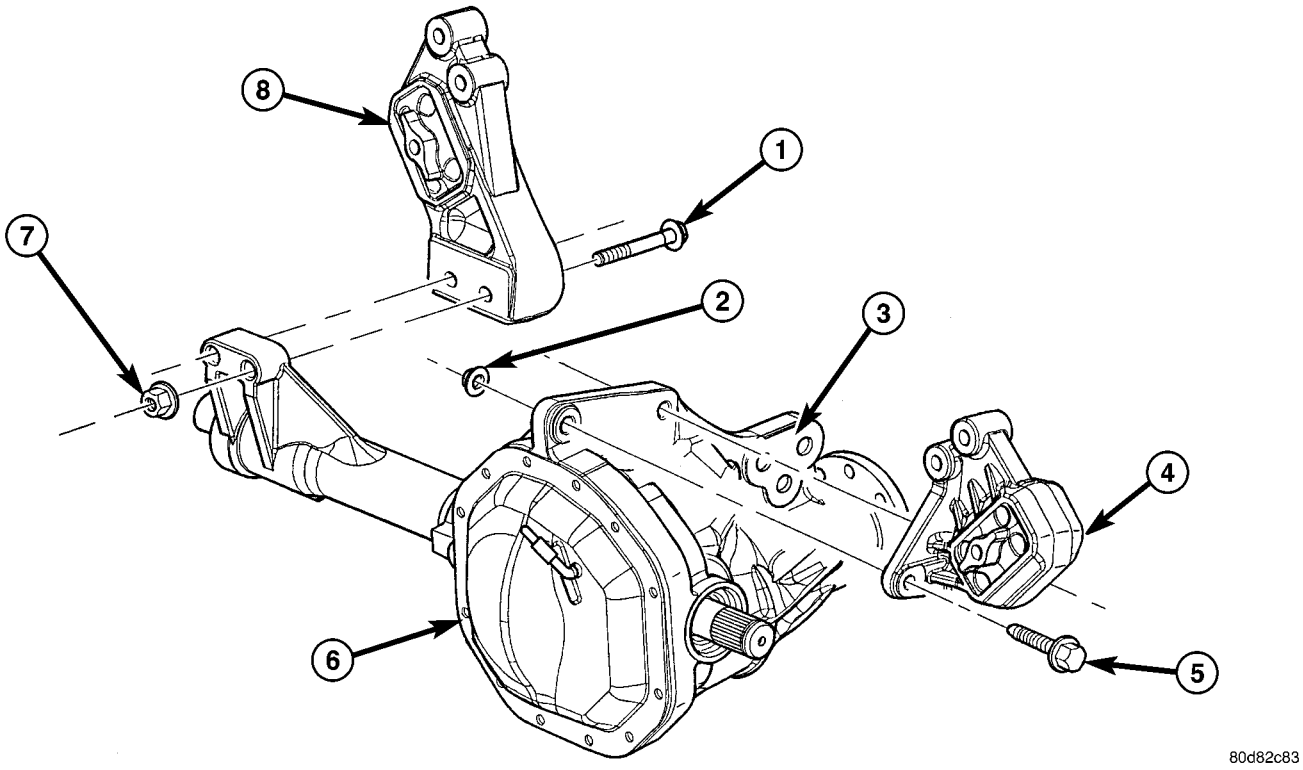

Fig. 23 ENGINE INSULATOR MOUNTS 4X4

7 - NUT
8 - RH INSULATOR MOUNT

FRONT MOUNT (Continued)

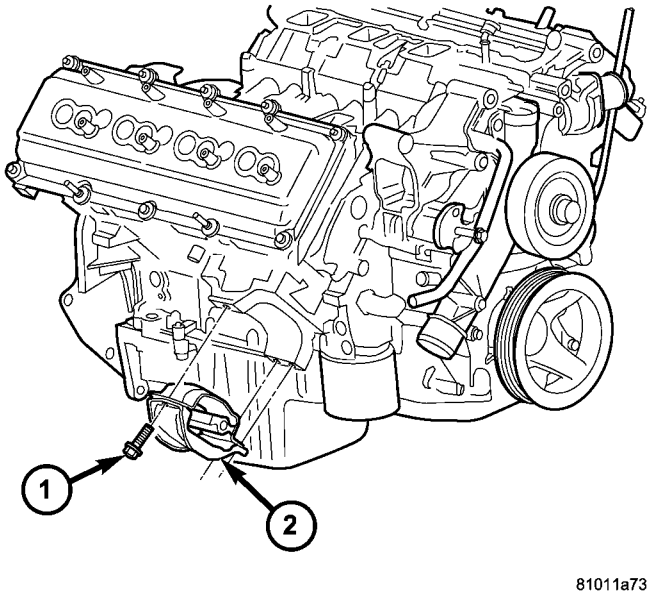

Fig. 24 RH INSULATOR

1 - BOLT
2 - INSULATOR

(4) Install mount through bolts.
(5) Tighten through bolts on both sides to 61 N·m (45 ft. lbs.).
(6) Lower vehicle.
(7) Connect negative battery cable.

4WD

NOTE: For mount to engine block and left engine bracket to front axle bolts, apply Mopar® Lock and Seal Adhesive, Medium Strength Threadlocker.

(1) Install the right and left side engine mounts to the front axle. Torque nuts to 94 N·m (70 ft. lbs.).
(2) Raise the front axle into the frame and install the left and right side through bolts. Torque nuts to 94 N·m (70 ft. lbs.).
(3) Insert the two upper through bolts into the right and left side engine mounts and loose assemble the two nuts onto the through bolts.
(4) Lower the engine using engine support fixture special tool # 8534, until the left and right side engine brackets rest on the through bolts, and the lower engine bracket through holes align with the engine mounts, and the left engine bracket holes align with the front axle slots (Fig. 25).
(5) Loose assemble the (3) bolts that attach the front axle to the left engine bracket.
(6) Loose assemble the lower through bolts.
(7) Torque the nuts for the (4) through bolts to 101 N·m (75 ft. lbs.).

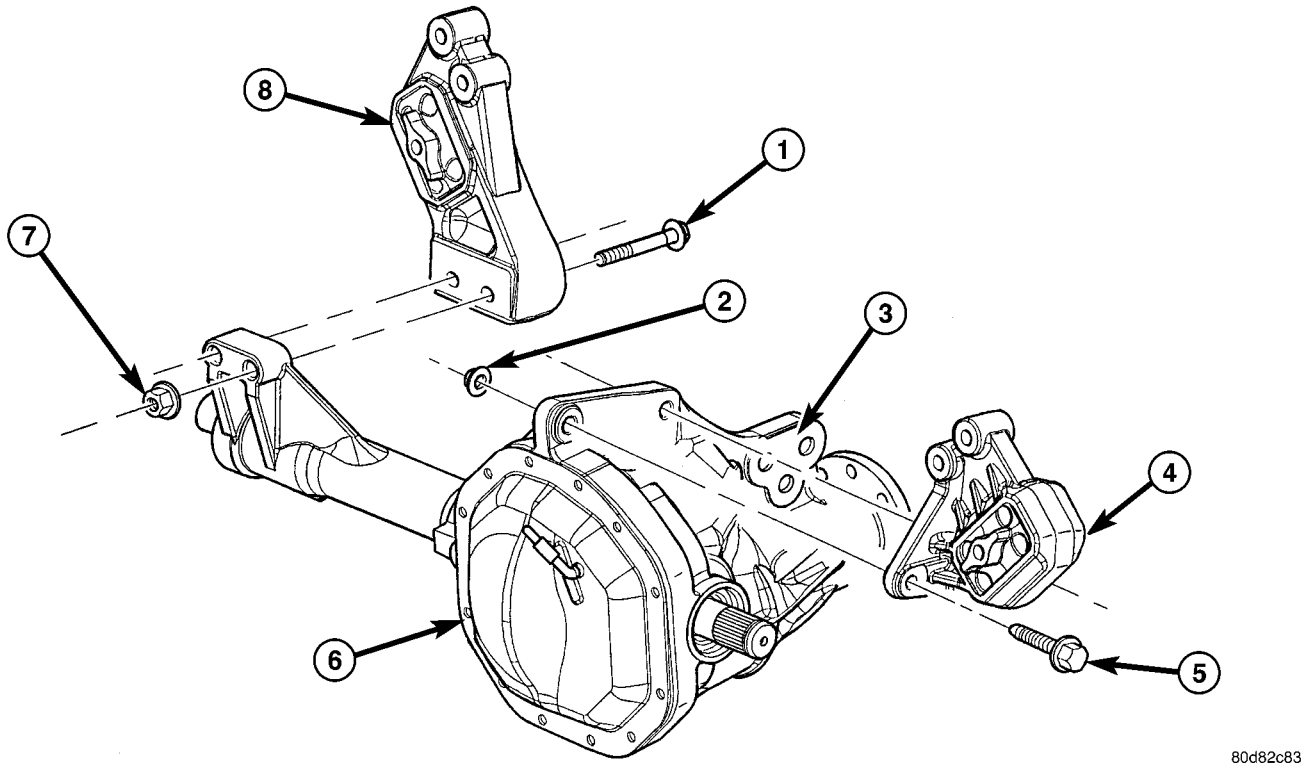

Fig. 25 ENGINE INSULATOR MOUNTS 4X4

1 - RH INSULATOR TO AXLE BOLT
2 - NUT
3 - PINION SUPPORT MOUNT
4 - LH INSULATOR MOUNT
5 - LH INSULATOR TO AXLE BOLT
6 - FRONT AXLE
7 - NUT
8 - RH INSULATOR MOUNT

FRONT MOUNT (Continued)

(8) Torque the (3) bolts that attach the front axle to the left engine bracket to 101 N·m (75 ft. lbs.).

(9) Install the engine oil filter, if removed.

(10) Install the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - INSTALLATION).

(11) Install the skid plate.

(12) Lower the vehicle.

(13) Reconnect the negative battery cable.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Using a suitable jack, support transmission.

(3) Remove the nuts from the transmission mount (Fig. 26).

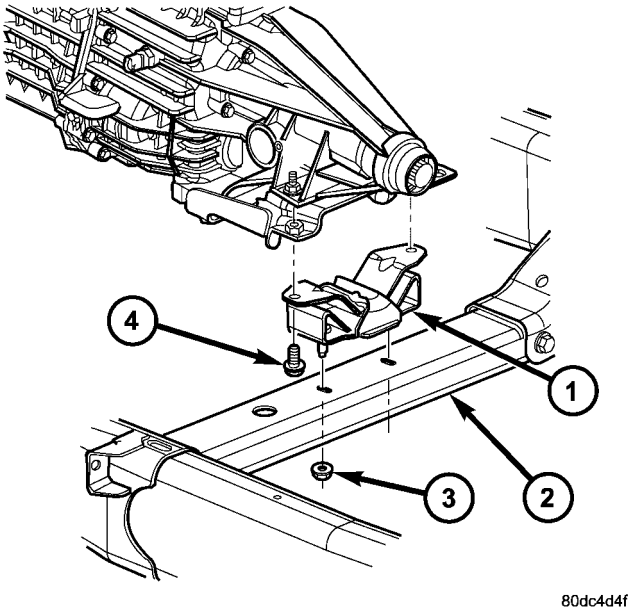

Fig. 26 TRANSMISSION MOUNT

1 - MOUNT
2 - CROSSMEMBER
3 - NUT
4 - BOLT

(4) Remove the two bolts that attach the transmission mount to the engine bracket.

(5) Raise the transmission enough to remove the mount from the crossmember.

(6) Remove the mount.

INSTALLATION

NOTE: Threadlocking compound must be applied to the bolts before installation.

(1) Install the two bolts that attach the transmission mount to the transmission bracket.

(2) Torque the bolts to 61N·m (45 ft.lbs.) torque.

(3) Lower the transmission so the transmission mount rests on the crossmember, and the studs of the transmission mount are aligned in the slots in the crossmember.

(4) Install the nuts onto the transmission mount studs through the crossmember access slot.

(5) Torque the nuts to 54N·m (40 ft. lbs.).

LUBRICATION

DESCRIPTION

The lubrication system (Fig. 27) is a full flow filtration pressure feed type.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit and install gauge assembly C-3292.

(2) Run engine until thermostat opens.

(3) Oil Pressure:

- Curb Idle–25 kPa (4 psi) minimum
- 3000 rpm–170 - 758 kPa (25 - 110 psi)

(4) If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

LUBRICATION (Continued)

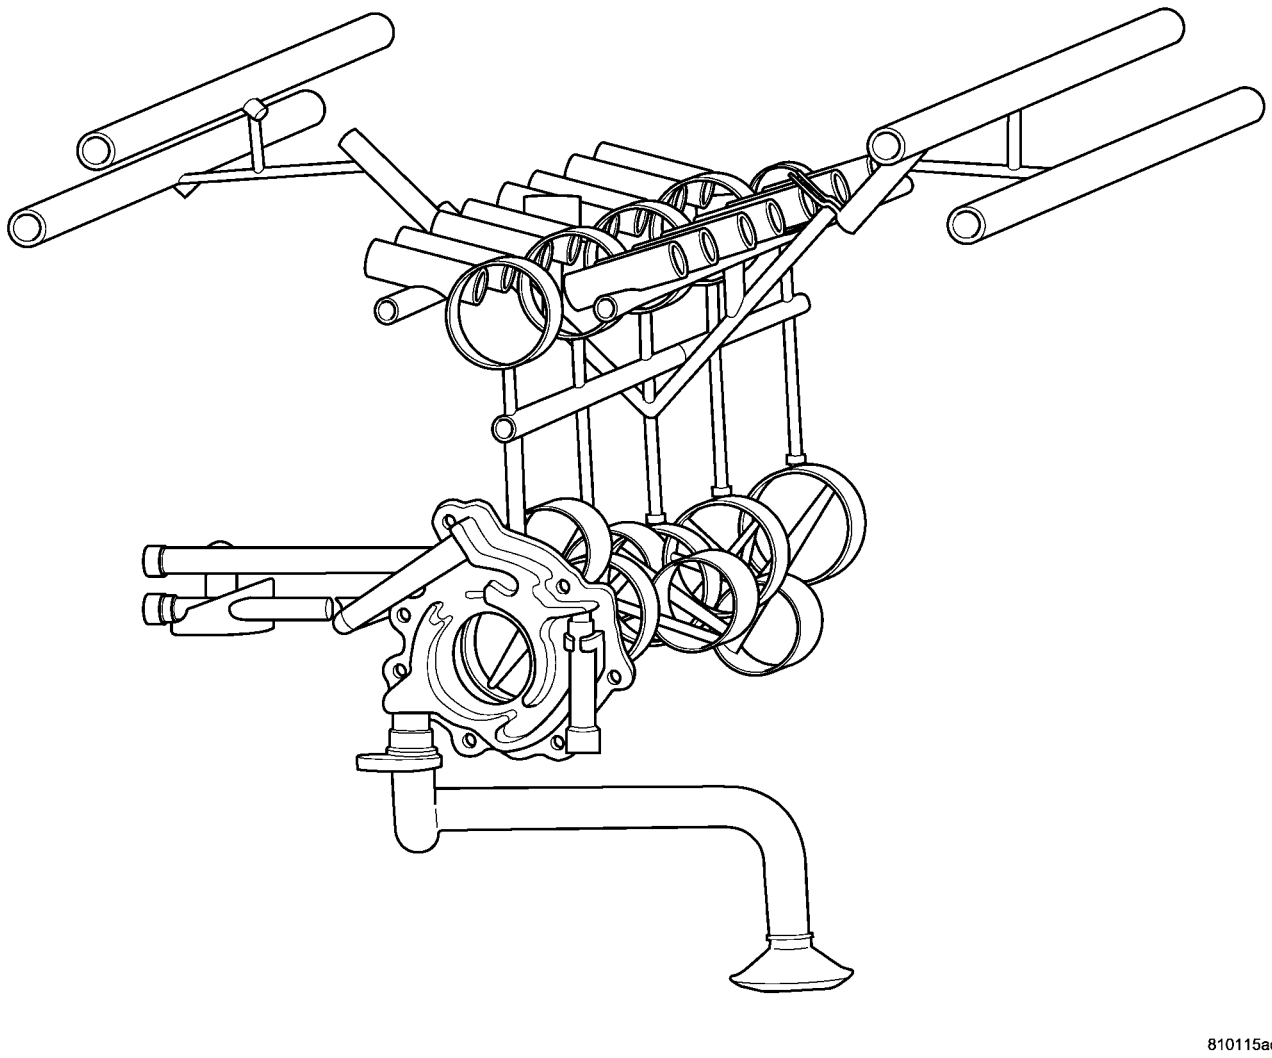

Fig. 27 Engine Oil Lubrication System

Air Leak Detection Test Method

(1) Remove the PCV valve from the IAFM. Cap or plug the PCV valve grommet.

(2) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

(3) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(4) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(5) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve.

(6) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

LUBRICATION (Continued)

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

OIL

STANDARD PROCEDURE - ENGINE OIL SERVICE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 in the 5.7L engines. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 28).

9400-9

Fig. 28 API SYMBOL

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located at the left hand of the engine on the 5.7L engines.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten

OIL (Continued)

minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

(1) Position vehicle on level surface.

(2) With engine OFF, allow approximately five minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.

(3) Wipe dipstick clean.

(4) Install dipstick and verify it is seated in the tube.

(5) Remove dipstick, with handle held above the tip, take oil level reading.

(6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules(Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Hoist and support vehicle on safety stands.

(3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.

(6) Install drain plug in crankcase. Torque to 34 N·m (25 ft. lbs.).

(7) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.

(8) Install oil fill cap.

(9) Start engine and inspect for leaks.

(10) Stop engine and inspect oil level.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss.

(4) When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: Make sure filter gasket was removed with filter.

(5) With a wiping cloth, clean the gasket sealing surface of oil and grime.

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 29) hand tighten filter one half turn, or 180°,do not over tighten.

(3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

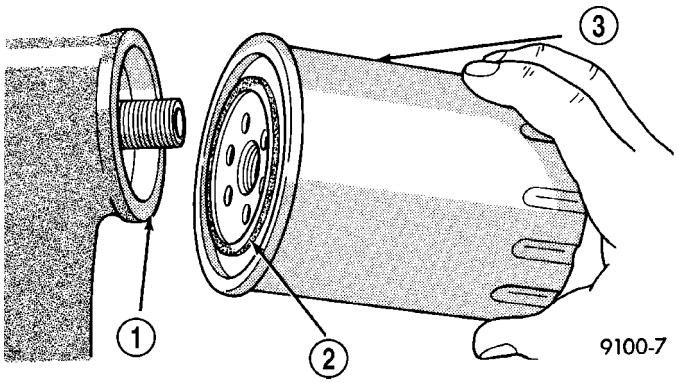

Fig. 29 Oil Filter Sealing Surface - Typical

1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

OIL PAN

REMOVAL

(1) Disconnect the negative battery cable.
(2) Install engine support fixture special tool # 8534. **Do not raise engine at this time.**
(3) Loosen both left and right side engine mount through bolts. Do not remove bolts.
(4) Remove the structural dust cover, if equipped.
(5) Drain engine oil.
(6) Remove the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - REMOVAL).

CAUTION: Only raise the engine enough to provide clearance for oil pan removal. Check for proper clearance at fan shroud to fan and cowl to intake manifold.

(7) Raise engine using special tool # 8534 to provide clearance to remove oil pan.

NOTE: Do not pry on oil pan or oil pan gasket. Gasket is integral to engine windage tray and does not come out with oil pan.

(8) Remove the oil pan mounting bolts and oil pan.

NOTE: The double ended oil pan studs must be installed in the same location that they were removed from.

(9) Unbolt oil pump pickup tube and remove tube.
(10) Inspect the integral windage tray and gasket and replace as needed.

INSTALLATION

(1) Clean the oil pan gasket mating surface of the block and oil pan.
(2) Inspect the integral windage tray and gasket and replace as needed.
(3) Reinstall the oil pump pickup tube with new o-ring. Tighten tube to pump fasteners to 28 N·m (250 in. lbs.).

NOTE: The double ended oil pan studs must be installed in the same location that they were removed from.

(4) Position the oil pan and install the mounting bolts and studs.. Tighten the mounting bolts to 12 N·m (105 in.lbs.).
(5) Lower the engine into mounts using special tool # 8534.
(6) Install both the left and right side engine mount through bolts. Tighten the nuts to 68 N·m (50 ft. lbs.).
(7) Remove special tool # 8534.
(8) Install structural dust cover, if equipped.
(9) Install the front crossmember(Refer to 13 - FRAME & BUMPERS/FRAME/FRONT CROSSMEMBER - INSTALLATION).
(10) Fill engine oil.
(11) Reconnect the negative battery cable.
(12) Start engine and check for leaks.

OIL PUMP

REMOVAL

(1) Remove the oil pan and pick-up tube(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(2) Remove the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(3) Remove the four bolts, and the oil pump.

CLEANING

(1) Wash all parts in a suitable solvent.

INSPECTION

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

(1) Remove the pump cover.
(2) Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
(3) Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body (Fig. 30). If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.
(4) Install the inner rotor in the into the oil pump body. Measure the clearance between the inner and outer rotors (Fig. 31). If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.
(5) Place a straight edge across the body of the oil pump (between the bolt holes), if a feeler gauge of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced (Fig. 32).
(6) Reinstall the pump cover. Torque fasteners to 15 N·m (132 in. lbs.).

OIL PUMP (Continued)

NOTE: The 5.7 Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

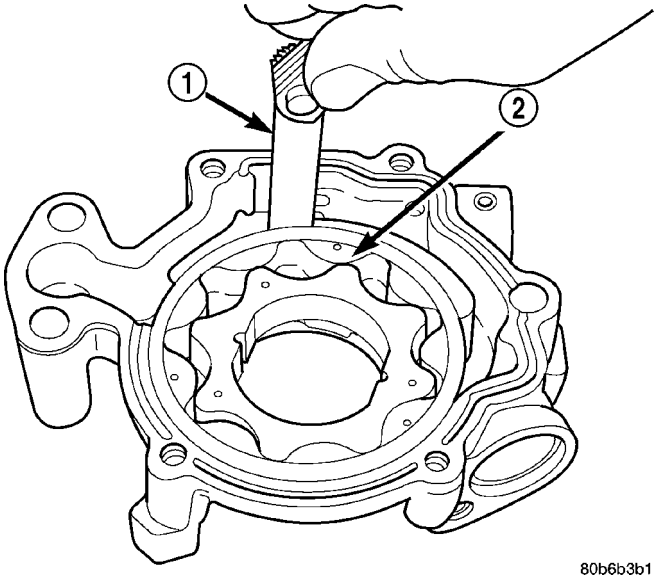

Fig. 30 Measuring Outer Rotor Clearance

1 - FEELER GAUGE
2 - OUTER ROTOR

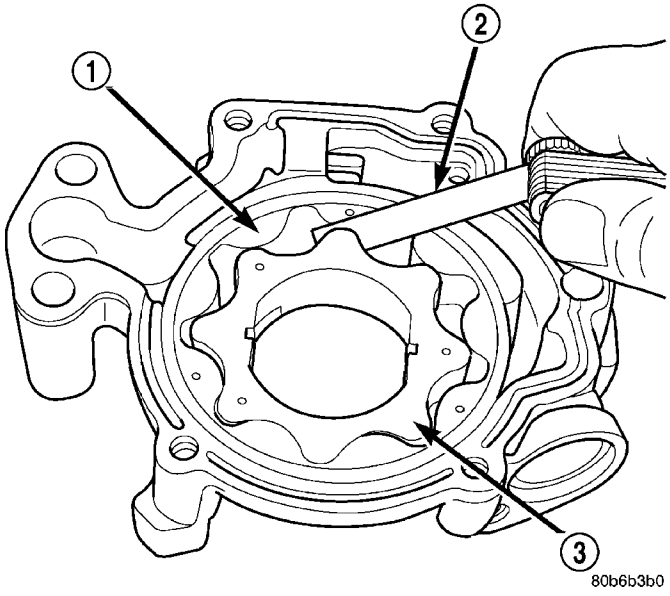

Fig. 31 Measuring Clearance Between Rotors - Typical

1 - OUTER ROTOR
2 - FEELER GAUGE
3 - INNER ROTOR

INSTALLATION

(1) Position the oil pump onto the crankshaft and install the 4 oil pump retaining bolts.

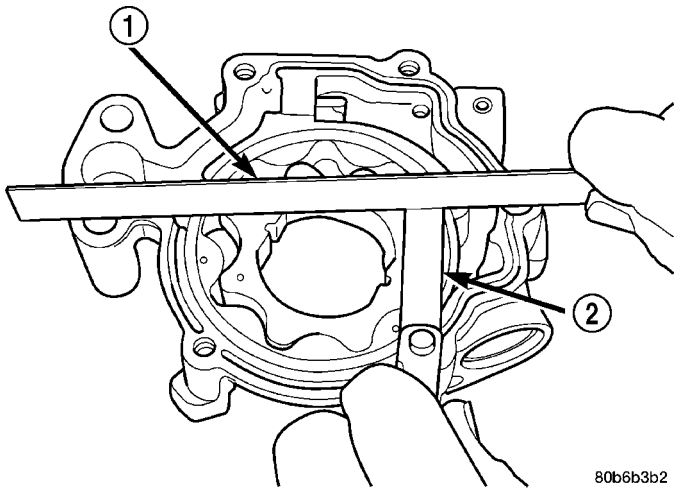

Fig. 32 Measuring Clearance Over Rotors - Typical

1 - STRAIGHT EDGE
2 - FEELER GAUGE

(2) Tighten the oil pump retaining bolts to 28 N·m (250 in. lbs.).

(3) Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(4) Install the pick-up tube and oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD

DESCRIPTION

The intake manifold is made of a composite material and features long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of eight individual press in place port gaskets to prevent leaks.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.

(2) Spray a small stream of water at the suspected leak area.

(3) If a change in RPM is observed the area of the suspected leak has been found.

(4) Repair as required.

INTAKE MANIFOLD (Continued)

REMOVAL

(1) Disconnect negative cable from battery.
(2) Remove resonator assembly and air inlet hose.
(3) Disconnect electrical connectors for the following components:
- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor

(4) Disconnect brake booster hose and positive crankcase ventilation (PCV) hose.
(5) Remove generator and set aside.

NOTE: It is not necessary to remove lines or remove freon from A/C compressor.

(6) Remove air conditioning compressor and set aside..
(7) Bleed fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
(8) Remove intake manifold retaining fasteners in a crisscross pattern starting from the outside bolts and ending at the middle bolts.
(9) Remove intake manifold and IAFM as an assembly.

CLEANING

NOTE: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

INSPECTION

(1) Inspect the intake sealing surface for cracks, nicks and distortion.
(2) Inspect the intake manifold vacuum hose fittings for looseness or blockage.
(3) Inspect the manifold to throttle body mating surface for cracks, nicks and distortion.

INSTALLATION

(1) Install intake manifold seals.
(2) Position intake manifold and IAFM.
(3) Install intake manifold retaining bolts, and tighten in sequence from the middle bolts towards the outside in a crisscross pattern. Torque fasteners to 12 N·m (105 in. lbs.).
(4) Connect electrical connectors for the following components:
- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor

(5) Install generator.
(6) Install A/C compressor.
(7) Connect Brake booster hose and Positive crankcase ventilation (PCV) hose.
(8) Install resonator assembly and air inlet hose.
(9) Connect negative cable to battery.

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

EXHAUST MANIFOLD

(1) Disconnect negative battery cable.
(2) Raise vehicle.
(3) Remove exhaust pipe to manifold bolts.
(4) Lower vehicle.
(5) Install engine support fixture special tool #8534.
(6) Raise engine enough to remove manifolds.

CAUTION: Do not damage engine harness while raising the engine.

(7) Remove heat shield.
(8) Remove manifold bolts.
(9) Remove manifold and gasket.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

EXHAUST MANIFOLD (Continued)

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

EXHAUST MANIFOLD

(1) Install manifold gasket and manifold.
(2) Install manifold bolts and tighten to 25 N·m (18 ft. lbs.).
(3) Install heat shield and tighten nuts to 15 N·m (11 ft. lbs.).
(4) Lower engine.

CAUTION: Do not damage engine harness while lowering the engine.

(5) Remove engine support fixture from engine.
(6) Raise vehicle.
(7) Tighten right and left side engine mount through bolts.
(8) Install exhaust flange to pipe bolts.
(9) Lower vehicle.
(10) Connect negative battery cable.

TIMING/CHAIN COVER

REMOVAL

(1) Disconnect the battery negative cable.
(2) Remove air cleaner assembly.
(3) Drain cooling system.
(4) Remove accessory drive belt.
(5) Remove fan and fan drive assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
(6) Remove coolant bottle and washer bottle.
(7) Remove fan shroud.

NOTE: It is not necessary to disconnect A/C lines or discharge freon.

(8) Remove A/C compressor and set aside.
(9) Remove the generator.
(10) Remove upper radiator hose.
(11) Disconnect both heater hoses at timing cover.
(12) Disconnect lower radiator hose at engine.
(13) Remove accessory drive belt tensioner and both idler pulleys.
(14) Remove crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

NOTE: Do not remove the hoses from the power steering pump.

(15) Remove power steering pump and set aside.
(16) Remove the dipstick support bolt.
(17) Drain the engine oil.
(18) Remove the oil pan and pick up tube(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

NOTE: It is not necessary to remove water pump for timing cover removal.

(19) Remove timing cover bolts and remove cover.

INSTALLATION

(1) Clean timing chain cover and block surface.

NOTE: Always install a new gasket on timing cover.

(2) Install cover and new gasket. Tighten fasteners to 28 N·m (250 in. lbs.).

NOTE: The large lifting stud is torqued to 55 N·m (40 ft. lbs.).

(3) Install the oil pan and pick up tube(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
(4) Install the A/C compressor.
(5) Install the generator.
(6) Install power steering pump.
(7) Install the dipstick support bolt.
(8) Install the thermostat housing.
(9) Install crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(10) Install accessory drive belt tensioner assembly and both idler pulleys.
(11) Install radiator lower hose.
(12) Install both heater hoses.
(13) Install radiator fan shroud.
(14) Install the fan and fan drive assembly
(15) Install the accessory drive belt.
(16) Install the coolant bottle and washer bottle.
(17) Install the upper radiator hose.
(18) Install the air cleaner assembly.
(19) Fill cooling system.
(20) Refill engine oil.
(21) Connect the battery negative cable.

TIMING/CHAIN AND SPROCKETS

REMOVAL

(1) Disconnect battery negative cable.
(2) Drain cooling system.
(3) Remove Timing Chain Cover.

CAUTION: The camshaft pin and the slot in the cam sprocket must be clocked at 12:00. The crankshaft keyway must be clocked at 2:00. The crankshaft sprocket must be installed so that the dots and or paint marking is at 6:00.

(4) Re-install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align timing chain sprockets and keyways as shown (Fig. 33).

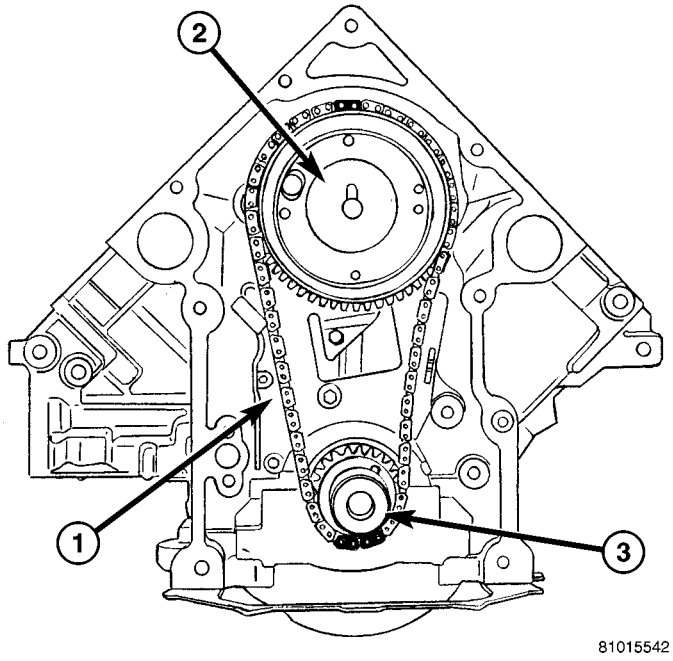

Fig. 33 5.7L TIMING MARK ALIGNMENT

1 - Chain Tensioner
2 - Camshaft Sprocket
3 - Crankshaft Sprocket

(5) Retract tensioner shoe until hole in shoe lines up with hole in bracket. Slide a suitable pin into the holes.
(6) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.
(7) If tensioner assembly is to be replaced, remove the tensioner to block bolts and remove tensioner assembly.

INSTALLATION

(1) If tensioner assembly is being replaced, install tensioner and mounting bolts. Torque bolts to 28 N·m (250 in. lbs.).
(2) Retract tensioner if required.

CAUTION: The camshaft pin and the slot in the cam sprocket must be clocked at 12:00. The crankshaft keyway must be clocked at 2:00. The crankshaft sprocket must be installed so that the dots and or paint marking is at 6:00.

(3) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores (Fig. 34).

CAUTION: The timing chain must be installed with the single plated link aligned with the dot and or paint marking on the camshaft sprocket. The crankshaft sprocket is aligned with the dot and or paint marking on the sprocket between two plated timing chain links.

(4) Place timing chain around both sprockets (Fig. 34).
(5) Lift sprockets and chain (keep sprockets tight against the chain in position as shown).

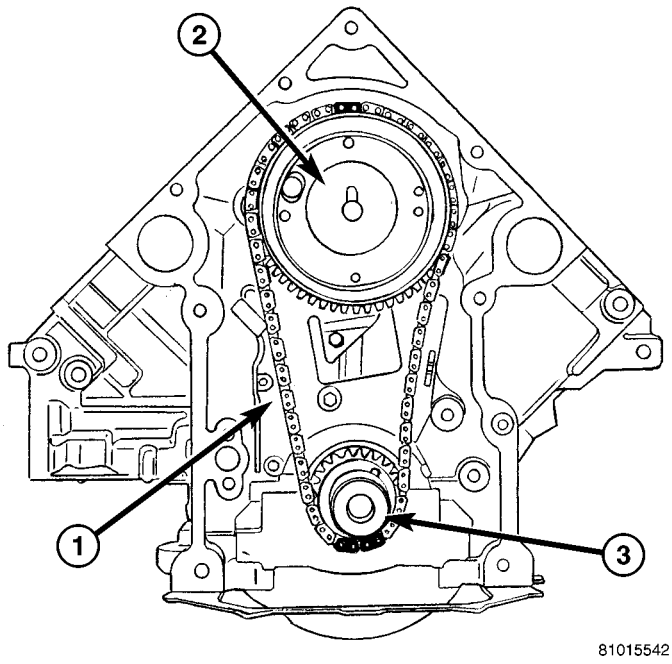

Fig. 34 5.7L TIMING MARK ALIGNMENT

1 - Chain Tensioner
2 - Camshaft Sprocket
3 - Crankshaft Sprocket

(6) Slide both sprockets evenly over their respective shafts and check alignment of timing marks.

(7) Install the camshaft bolt. Tighten the bolt to 122 N·m (90 ft. lbs.) torque.

(8) **Remove tensioner pin.** Again, verify alignment of timing marks.

(9) Install the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(10) Install the oil pan and pick up(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Fill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(13) Connect battery negative cable.

(14) Start engine and check for oil and coolant leaks.

TIMING CHAIN/TENSIONER

DESCRIPTION

The timing chain tensioner is a stamped steel constant tension mechanical design. It is mounted to the front of the engine, behind the timing chain drive.

OPERATION

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. A nylon covered spring steel arm presses on the timing chain maintaining the correct chain tension.

ENGINE 5.9L DIESEL

DESCRIPTION

The cylinder block is constructed of cast iron. The casting is a skirted design which incorporates longitudal ribs for superior strength and noise reduction. The block incorporates metric straight thread o-ring fittings at lubrication oil access points. The engine (Fig. 1) is manufactured with the cylinders being a non-sleeved type cylinder. However, one approved service method is to bore out the cylinders and add cylinder sleeves to the cylinder block.

The cylinders are numbered front to rear (Fig. 2); 1 to 6. The firing order is 1–5–3–6–2–4.

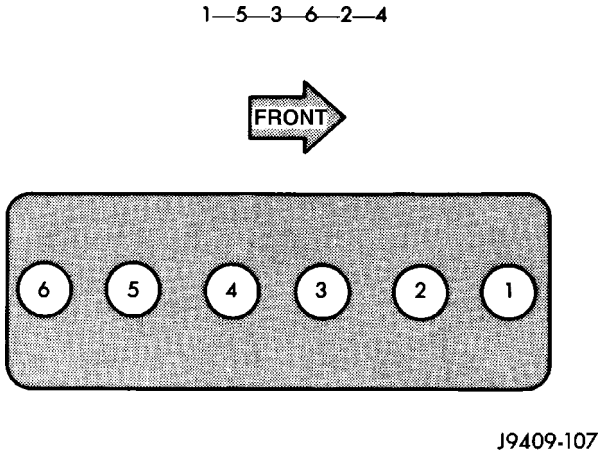

Fig. 2 Cylinder Numbering

ENGINE 5.9L DIESEL (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE LOW	1. Low oil level.	1. (a) Check and fill with clean engine oil. (b) Check for a severe external oil leak that could reduce the pressure.
	2. Oil viscosity thin, diluted or wrong specification.	2. (a) Verify the correct engine oil is being used. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). 2. (b) Look for reduced viscosity from fuel dilution.
	3. Improperly operating pressure switch/gauge.	3. Verify the pressure switch is functioning correctly. If not, replace switch/gauge.
	4. Relief valve stuck open.	4. Check/replace valve.
	6. If cooler was replaced, shipping plugs may have been left in cooler	6. Check/remove shipping plugs.
	7. Worn oil pump.	7. Check and replace oil pump.
	8. Suction tube loose or seal leaking.	8. Check and replace seal.
	9. Loose main bearing cap.	9. Check and install new bearing. Tighten cap to proper torque.
	10. Worn bearings or wrong bearings installed.	10. Inspect and replace connecting rod or main bearings. Check and replace directed piston cooling nozzles.
	11. Directed piston cooling nozzles under piston, bad fit into main carrier.	11. Check directed piston cooling nozzles position.
	12. Loose oil rifle plug with saddle-jet style nozzles	12.Tighten oil rifle plug.
	13. Loose directed piston cooling nozzle.	13. Tighten directed piston cooling nozzle.
	14. Both J-jet and saddle jet style cooling nozzle installed.	14. Install correct style jet.
LUBRICATING OIL PRESSURE TOO HIGH	1. Pressure switch/gauge not operating properly.	1. Verify pressure switch is functioning correctly. If not, replace switch/gauge.

ENGINE 5.9L DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	2. Engine running too cold.	2. Refer to Coolant Temperature Below Normal (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	3. Oil viscosity too thick.	3. Make sure the correct oil is being used. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
	4. Oil pressure relief valve stuck closed or binding	4. Check and replace valve.
LUBRICATING OIL LOSS	1. External leaks.	1. Visually inspect for oil leaks. Repair as required.
	2. Crankcase being overfilled.	2. Verify that the correct dipstick is being used.
	3. Incorrect oil specification or viscosity.	3. (a) Make sure the correct oil is being used (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). (b) Look for reduced viscosity from dilution with fuel. (c) Review/reduce oil change intervals.
	4. Oil cooler leak	4. Check and replace the oil cooler.
	5. High blow-by forcing oil out the breather.	5. Check the breather tube area for signs of oil loss. Perform the required repairs.
	6. Turbocharger leaking oil to the air intake.	6. Inspect the air ducts for evidence of oil transfer. Repair as required.
COMPRESSION KNOCKS	1. Air in the fuel system.	1. Identify location of air leak and repair. Do not bleed high pressure fuel system.
	2. Poor quality fuel or water/gasoline contaminated fuel.	2. Verify by operating from a temporary tank with good fuel. Clean and flush the fuel tank. Replace fuel/water separator filter.
	3. Engine overloaded.	3. Verify the engine load rating is not being exceeded.
	4. Improperly operating injectors.	5. Check and replace misfiring/inoperative injectors.
EXCESSIVE VIBRATION	1. Loose or broken engine mounts.	1. Replace engine mounts.
	2. Damaged fan or improperly operating accessories.	2. Check and replace the vibrating components.
	3. Improperly operating vibration damper	3. Inspect/replace vibration damper.
	4. Improperly operating electronically controlled viscous fan drive.	4. Inspect/replace fan drive.
	5. Worn or damaged generator bearing.	5. Check/replace generator.
	6. Flywheel housing misaligned.	6. Check/correct flywheel alignment.

ENGINE 5.9L DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	7. Loose or broken power component.	7. Inspect the crankshaft and rods for damage that causes an unbalance condition. Repair/replace as required.
	8. Worn or unbalanced driveline components.	8. Check/repair driveline components.
EXCESSIVE ENGINE NOISES	1. Drive belt squeal, insufficient tension or abnormally high loading.	1. Check the automatic tensioner and inspect the drive belt. Make sure water pump, tensioner pulley, fan hub, generator and power steering pump turn freely.
	2. Intake air or exhaust leaks.	2. Refer to Excessive Exhaust Smoke (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
	3. Excessive valve lash.	3. Adjust valves. Make sure the push rods are not bent and rocker arms, adjusting screws, crossheads, are not severely worn. Replace bent or severely worn components.
	4. Turbocharger noise.	4. Check turbocharger impeller and turbine wheel for housing contact. Repair/replace as required.
	5. Gear train noise.	5. Visually inspect and measure gear backlash. Replace gears as required.
	6. Power function knock.	6. Check/replace rod and main bearings.

ENGINE 5.9L DIESEL (Continued)

DIAGNOSIS AND TESTING—SMOKE DIAGNOSIS CHARTS

The following charts include possible causes and corrections for **excess or abnormal** exhaust smoke. Small amounts of exhaust smoke (at certain times) are to be considered normal for a diesel powered engine.

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Air filter dirty or plugged.	Check Filter Minder® at air filter (Refer to 9 - ENGINE/ AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
Air intake system restricted.	Check entire air intake system including all hoses and tubes for restrictions, collapsed parts or damage. Repair/replace as necessary.
Air Leak in Intake System.	Check entire air intake system including all hoses and tubes for cracks, loose clamps and/or holes in rubber ducts. Also check intake manifold for loose mounting hardware.
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures Information.
Engine Control Module (ECM) not calibrated or ECM has incorrect calibration.	Refer to Powertrain Diagnostic Procedures Information.
Exhaust system restriction is above specifications.	Check exhaust pipes for damage/restrictions. Repair as necessary.
Fuel grade is not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel injection pump malfunctioning.	A DTC may have been set. If so, refer to Powertrain Diagnostic Procedures Information.
Fuel injector malfunctioning.	A DTC may have been set. Perform ″Cylinder Cutout Test″ using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures Information and, to (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Fuel return system restricted.	Check fuel return lines for restriction (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).
Intake manifold restricted.	Remove restriction.
Manifold Air Pressure (Boost) Sensor or sensor circuit malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Raw fuel in intake manifold.	Fuel injectors leaking on engine shutdown. Do Fuel Injector Test (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Turbocharger air intake restriction.	Remove restriction.
Turbocharger damaged.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).
Turbocharger has excess build up on compressor wheel and/or diffuser vanes.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - CLEANING).
Turbocharger wheel clearance out of specification.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Air in fuel supply: Possible leak in fuel supply side (between transfer pump and fuel tank module).	(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Coolant leaking into combustion chamber.	Do pressure test of cooling system (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures Information.
In very cold ambient temperatures, engine block heater is malfunctioning (if equipped).	(Refer to 7 - COOLING/ENGINE/ENGINE BLOCK HEATER - REMOVAL).
Engine coolant temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also check thermostat operation (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING).
Engine Control Module (ECM) not calibrated or has incorrect calibration.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Fuel filter plugged.	Refer to Powertrain Diagnostic Manual for fuel system testing.
Fuel grade not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel heater element or fuel heater temperature sensor malfunctioning. This will cause wax type build-up in fuel filter.	Refer to Fuel Heater Testing (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL HEATER - DIAGNOSIS AND TESTING).
Fuel injector malfunctioning.	A DTC should have been set. Perform ″Cylinder cutout Test″ using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures Information and, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Fuel injector hold-downs loose.	Torque to specifications.
Fuel injector protrusion not correct.	Check washer (shim) at bottom of fuel injector for correct thickness. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ FUEL INJECTOR - INSTALLATION)
Fuel injection pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Fuel supply side restriction to transfer pump.	Refer to Powertrain Diagnostic Manual for fuel system testing.
Fuel transfer (lift) pump malfunctioning.	A DTC may have been set. Refer to Powertrain Diagnostic Procedures Information.
Intake/Exhaust valve adjustments not correct (too tight).	(Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
Intake manifold air temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Intake manifold heater circuit not functioning correctly in cold weather.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also check heater elements for correct operation.
Intake manifold heater elements not functioning correctly in cold weather.	A DTC should have been set if heater elements are malfunctioning. Refer to Powertrain Diagnostic Procedures Information.
Internal engine damage (scuffed cylinder).	Analyze engine oil and inspect oil filter to locate area of probable damage.
Restriction in fuel supply side of fuel system.	Refer to Powertrain Diagnostic Manual for fuel system testing.

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE BLUE SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Dirty air cleaner or restricted turbocharger intake duct.	Check Filter Minder® at air filter housing. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
Air leak in boost system between turbocharger compressor outlet and intake manifold.	Service air charge system..
Obstruction in exhaust manifold.	Remove exhaust manifold and inspect for blockage (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
Restricted turbocharger drain tube.	Remove turbocharger drain tube and remove obstruction.
Crankcase ventilation system plugged.	Inspect crankcase ventilation system for function
Valve seals are worn, brittle, or improperly installed.	Replace valve stem oil seals (Refer to 9 - ENGINE/ CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - REMOVAL).
Valve stems and/or guides are worn.	Remove valves and inspect valves and guides. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
Broken or Improperly installed piston rings.	Tear down engine and inspect piston rings.
Excessive piston ring end gap.	Remove pistons and measure piston ring end gap (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).
Excessive cylinder bore wear and taper.	Remove pistons and measure cylinder bore wear and taper (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).
Cylinder damage.	Remove pistons and inspect cylinder bore for cracks or porosity. Repair with cylinder liner if necessary. (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).
Piston damage.	Remove pistons and inspect for cracks, holes. Measure piston for out-of-round and taper (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSPECTION).
Turbocharger failure.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).

ENGINE 5.9L DIESEL (Continued)

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION/LEAKAGE TESTS

CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure batteries are completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnostic purposes.

(1) Disconnect the fuel inlet line to the fuel transfer pump. Plug the fuel line from the fuel tank.

(2) Start the engine and idle until the engine stalls (runs out of fuel).

(3) Disconnect all three injector wire harness connectors at the rocker housing.

(4) Remove the breather cover and cylinder head cover.

(5) Remove the high pressure fuel line between the cylinder head and fuel rail for the cylinder to be tested. Use tool# 9011 to cap this fuel rail on the cylinder being tested.

(6) Remove the exhaust rocker lever.

(7) Use Tool 9010 to remove the injector and copper sealing washer.

(8) Install the exhaust rocker lever and torque to 36 N·m (27 ft. lbs.).

(9) Cover the remaining rocker levers with clean shop towels to prevent any oil splatter under the hood.

(10) Place a rag over the compression test tool fitting. Crank the engine for 2–3 seconds to purge any fuel that may have drained into the cylinder when the injector was removed.

(11) Connect the compression test gauge.

(12) Crank the engine for 5 seconds and record the pressure reading. Repeat this step three times and calculate the average of the three readings.

NOTE: The minimum cylinder pressure is 350 psi. Cylinder pressure should be within 20% from cylinder to cylinder.

(13) Combustion pressure leakage can be checked if cylinder pressure is below the specification. Perform the leakage test procedure on each cylinder according to the tester manufacturer instructions.

(14) Upon completion of the test check an erase any engine related fault codes.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss

(1) Start and operate the engine until it attains normal operating temperature.

(2) Remove the breather cover and cylinder head cover.

(3) Disconnect all three injector wire harness connectors at the rocker housing.

(4) Bring the cylinder to be tested to TDC.

(5) Remove the high pressure fuel line between the cylinder head and the fuel rail for the cylinder to be tested.

(6) Install capping Tool 9011 onto the rail.

(7) Remove the high pressure connector nut and high pressure connector with Tool 9015.

(8) Remove the exhaust and intake rocker lever.

(9) Use Tool 9010 to remove the injector and copper sealing washer.

(10) Install compression test Tool 9007 into the injector bore.

(11) Connect the leakage tester and perform the leakage test procedure on each cylinder according to the tester manufacturer's instructions.

(12) Upon completion of the test check and erase any engine related fault codes.

STANDARD PROCEDURE

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the

material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Disconnect the negative cable(s) from the battery.

(2) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(3) Place a shop towel around the fuel injectors to catch any fluid that may possibly be under pressure in the cylinder head. Remove the fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).

(4) With all injectors removed, rotate the crankshaft using the crankshaft barring tool (PN 7471–B).

(5) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(6) Be sure all fluid has been removed from the cylinders.

(7) Repair engine or components as necessary to prevent this problem from occurring again.

(8) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(9) Install fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).

ENGINE 5.9L DIESEL (Continued)

(10) Drain engine oil. Remove and discard the oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
(11) Install the drain plug. Tighten the plug to 50 N·m (37 ft. lbs.) torque.
(12) Install a new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
(13) Fill engine crankcase with the specified amount and grade of oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).
(14) Connect the negative cable(s) to the battery.
(15) Start the engine and check for any leaks.

REMOVAL

REMOVAL - ENGINE

(1) Disconnect both battery negative cables.
(2) Disconnect engine grid heater harness at grid heater relays.
(3) Disconnect electrical connections from rear of alternator.
(4) Recover A/C refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
(5) Raise vehicle on a hoist.
(6) Drain engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
(7) Remove engine oil drain plug and drain engine oil.
(8) Reinstall drain plug. Tighten to 50N·m (37 ft. lbs.) torque.
(9) Lower the vehicle.
(10) Remove fan/drive assembly. Refer to Section 7 – Fan/Drive Removal
(11) Remove radiator upper hose.
(12) Remove upper fan shroud mounting bolts.
(13) Disconnect the coolant recovery bottle hose from the radiator fill neck and remove bottle.
(14) Using a 36mm wrench, remove viscous fan/drive assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(15) Remove cooling fan and shroud together.
(16) Disconnect heater core supply and return hoses from the cylinder head fitting and coolant pipe.
(17) Raise vehicle on a hoist.
(18) Remove transmission and transfer case (if equipped).
(19) Disconnect exhaust pipe from turbocharger extension pipe.
(20) Disconnect engine harness to vehicle harness connectors.
(21) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
(22) Remove flywheel/flexplate.
(23) Remove transmission adapter
(24) Disconnect A/C suction/discharge hose from the rear of the A/C compressor.
(25) Lower vehicle.
(26) Disconnect lower radiator hose from radiator outlet.
(27) Automatic transmission models:
(28) Disconnect transmission oil cooler lines from in front of radiator using special tool #6931
(29) Remove radiator. (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
(30) If A/C equipped, disconnect A/C condenser refrigerant lines.
(31) Disconnect charge air cooler piping.
(32) Remove charge air cooler mounting bolts.
(33) Remove charge air cooler (and A/C condenser if equipped) from vehicle.
(34) Remove damper and speed indicator ring from front of engine.
(35) Disconnect engine block heater connector.
(36) Disconnect A/C compressor and pressure sensor electrical connectors.
(37) Remove the passenger battery ground cable from the engine block. Remove the driver side battery ground cable from the engine block.
(38) Remove power steering pump from engine by removing 3 bolts.
(39) Remove accelerator linkage cover.
(40) Disconnect cables from on-engine APPS.
(41) Disconnect the ECM power connector.
(42) Disconnect the ECM ground wire from the hydroform screw.
(43) Disconnect the fuel supply and return hoses.
(44) Remove the cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(45) Disconnect the 3 injector harness connectors at the rocker housing. Disconnect the wire harnesses from the injectors.
(46) Remove the rear engine lift bracket.
(47) Remove cylinder #4, #5, and #6 intake and exhaust rocker arms, pedestals, and push tubes. Note the original location for re-assembly.
(48) Loosen #6 fuel line shield bolts and rotate shield out of the way.
(49) Remove cylinder #5 and #6 high pressure fuel lines. Remove the fuel connector tube nut and fuel connector tube. Remove cylinder #5 and #6 fuel injector.
(50) Remove rocker housing.

ENGINE 5.9L DIESEL (Continued)

(51) Remove two cylinder head bolts according to the diagram below and install Tool # 9009. Torque bolts to 105N·m (77ft. lbs.) (Fig. 3).

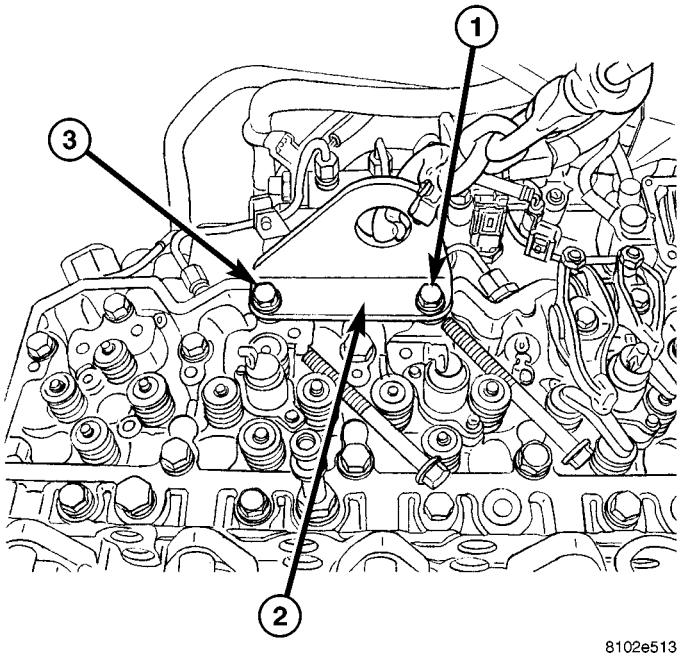

Fig. 3 ENGINE LIFT BRACKET

1 - Head bolt
2 - Engine Lift Bracket
3 - Head Bolt

(52) Loosen but do not remove engine mount through bolts and nuts.

(53) Disconnect hood support struts and position hood out of the way.

(54) Attach a chain with two hooks to the engine lift brackets.

(55) While keeping engine level, lift straight up out of the mounts.

(56) Rotate nose of engine upward and pull out of chassis.

REMOVAL—CRANKCASE BREATHER

(1) Remove the oil fill cap.

(2) Remove the breather cover bolts (Fig. 4).

(3) Remove breather cover.

(4) Disconnect breather tube and lube oil drain tube from breather.

(5) Remove breather mounting bolts.

(6) Remove breather from cylinder head cover.

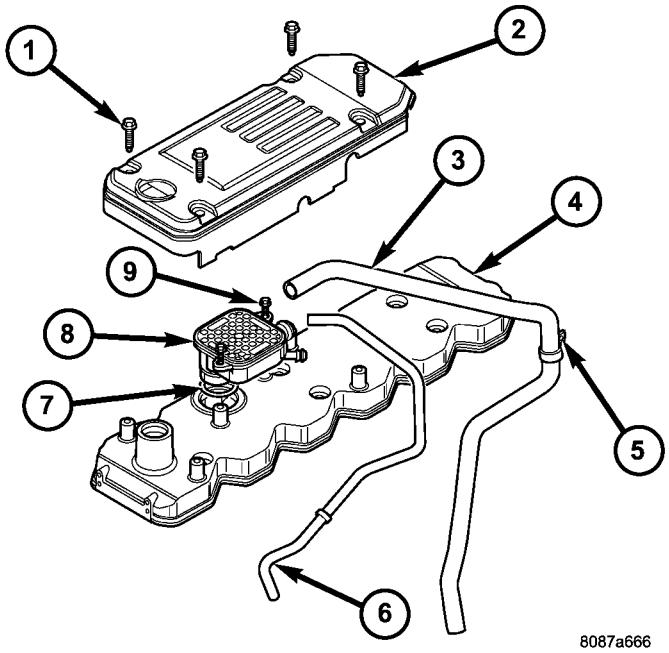

Fig. 4 Crankcase Breather Vapor Canister

1 - BREATHER COVER BOLT
2 - BREATHER COVER
3 - BREATHER TUBE
4 - ROCKER COVER
5 - BREATHER TUBE MOUNTING BRACKET

8 - BREATHER
9- BREATHER MOUNTING BOLT

INSTALLATION

INSTALLATION - ENGINE

(1) Remove cylinder head bolts according to the diagram below. Install special Tool 9009. Torque bolts to 105N·m (77ft. lbs.)

(2) Lower engine into the engine compartment and install the engine the engine mount through bolts and nuts.

(3) Tighten the mount through bolts and nuts to 88 N-m (65 ft-lbs) torque.

(4) Remove the engine lifting device (Tool 9009).

(5) Check cylinder head capscrew length and install into cylinder head.

(6) Torque in 4 steps to:

- Step 1—Tighten to 70 N·m (52 ft. lbs.) torque.
- Step 2—Back off 360°.
- Step 3—Tighten to 105 N·m (77 ft. lbs.) torque.
- Step 4—Rotate 90°.

(7) Install rocker housing. Torque to 24 N-m (18 ft-lbs). Refer to (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ENGINE 5.9L DIESEL (Continued)

(8) Replace injector o-ring and sealing washer on injectors #5 and #6. Install injectors and torque using the following steps:

- Step 1—Install injector hold-down capscrews and torque to 5 N·m (44 in. lbs.) torque.
- Step 2—Loosen injector hold-down capscrews.
- Step 3—Install HPC connector tube and nut. Torque nut to 15 N·m (11 ft. lbs.) torque.
- Step 4—Torque injector hold-down capscrews to 10 N·m (89 in. lbs.) torque.
- Step 5—Torque HPC connector tube nut to 50 N·m (37 ft. lbs.) torque.

(9) Install #5 and #6 high pressure fuel lines. Follow correct torque sequence per section 14. Torque fuel line fittings to 30 N-m (22 ft-lb). Torque brace capscrew to 24 N-m (18 ft-lb).

(10) Install rear engine lift bracket. Torque to 77 N-m (57 ft-lb).

(11) Install push tubes, rocker arms, and pedestals for cylinders #4, #5, and #6. Torque the mounting bolts to 36 N-m (27 ft-lbs).

(12) Reset valve lash on cylinders #4, #5, and #6. Torque adjusting nuts to 24 N-m (18 ft-lbs).

(13) Install cylinder head cover. Torque to 24 N-m (18 ft-lbs).(Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(14) Connect breather tube and lube oil drain tube to breather housing cover. Install breather housing. Torque capscrews to 24 N-m (18 ft-lbs)

(15) Connect fuel supply and return hoses.

(16) Connect ECM ground to hydroform screw. Connect ECM power connector.

(17) Install the APPS cable(s) to the APPS. Install the throttle linkage cover.

(18) Install the power steering pump.

(19) Install the damper and speed indicator ring. Torque to 40 N-m (30 ft-lb) plus 60 degrees.

(20) Connect the engine block heater connection.

(21) Connect the A/C compressor and pressure sensor connectors

(22) Install the charge air cooler and a/c condenser (if equipped). Install and tighten the charge air cooler mounting bolts to 2 N-m (17 in-lbs).

(23) Connect the charge air cooler piping. Torque all clamps to 8 N-m (72 in-lbs).

(24) Connect the a/c refrigerant lines to the a/c condenser (if equipped).

(25) Install the radiator upper support panel.

(26) Install radiator.

(27) Connect the transmission quick-connect oil cooler lines.

(28) Raise vehicle.

(29) Connect a/c compressor suction/discharge hose (if equipped).

(30) Install the radiator lower hose and clamps.

(31) Install the battery negative cables to the engine block on the driver and passenger side.

(32) Install the transmission adapter with a new camshaft rectangular ring seal. Torque to 77 N-m (57 ft-lb).

(33) Install the flywheel/flexplate. Torque to 137 N-m (101 ft-lb).

(34) Install the starter motor. Torque to 43 N-m (32 ft-lb). (Refer to 8 - ELECTRICAL/STARTING/ STARTER MOTOR - INSTALLATION).

(35) Connect engine to vehicle harness connectors.

(36) Install transmission and transfer case (if equipped).

(37) Connect the exhaust pipe to the turbocharger elbow.

(38) Connect the transmission auxiliary oil cooler lines (if equipped).

(39) Lower the vehicle.

(40) Connect the heater core supply and return hoses.

(41) Install the cooling fan and upper fan shroud at the same time. (Refer to 7 - COOLING/ENGINE/ RADIATOR FAN - INSTALLATION).

(42) Install the coolant recovery bottle.

(43) Install the windshield washer bottle.

(44) Install the upper radiator hose and clamps.

(45) Raise vehicle.

(46) Connect electronically controlled fan drive wire harness. Install lower radiator fan shroud.

(47) Change oil filter and install new engine oil.

(48) Fill the cooling system with coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).

(49) Connect grid heater harness at grid heater relays.

(50) Connect electrical connections to rear of alternator.

(51) Start the engine and inspect for engine oil, coolant, and fuel leaks.

INSTALLATION—CRANKCASE BREATHER

(1) Install a new o-ring onto the breather element.

(2) Lubricate o-ring and install into cylinder head cover. Torque capscrews to 10 N·m (89 in. lbs.).

(3) Connect breather tube and lube oil drain tube.

(4) Install breather cover (Fig. 4). Torque to 24 N·m (18 ft. lbs.)

(5) Install oil fill cap.

ENGINE 5.9L DIESEL (Continued)

SPECIFICATIONS

SPECIFICATIONS - 5.9L DIESEL

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION
Engine Type	In-Line 6 Cyl. Turbo Diesel
Displacement	5.9 Liters 359 (Cubic Inches)
Bore	102.0 mm (4.02 in.)
Stroke	120.0 mm (4.72 in.)
Compression Ratio 305/250/235 H.P Version	17.2:1
Cylinder Pressure (Minimum)	350 psi.
Horsepower High Output 48 RE A/T and NV 5600 M/T	305 HP @ 2900 RPM
Horsepower Standard Output 48 RE A/T and NV 4500 M/T	235 HP @ 2700 RPM (CARB) 250 HP @ 2900 RPM (49 State)
Torque Rating High Output (48RE A/T and NV 5600 M/T)	555 LB-FT @ 1400 RPM
Torque Rating Standard Output (48RE A/T and NV 4500 M/T)	460 LB-FT @ 1400 RPM
Lubrication System	Pressure Feed-Full Flow With Bypass Valve
Firing Order	1-5-3-6-2-4
Cylinder Block	Cast Iron
Crankshaft	Induction Hardened Forged Steel
Cylinder Head	Cast Iron With Valve Seat Inserts
Combustion Chambers	High Swirl Bowl
Camshaft	Chilled Ductile Iron
Pistons	Cast Aluminum
Connnecting Rods	Cross Rolled Micro Alloy

ENGINE DATA PLATE

DESCRIPTION

The engine data plate contains specific information that is helpful to servicing and obtaining parts for the engine. The data plate can be found affixed to the breather cover on the left side of the engine. Information that can be found on the data plate includes:

- Date of Engine Manufacture
- Engine Serial Number
- Control Parts List (CPL)
- Engine Rated Horsepower
- Engine Firing Order
- Engine Displacement
- Valve Lash Reset Specifications

If the engine data plate is missing or not legible, the engine serial number is used for engine identification. The engine serial number is stamped on the right side of the block, on top of the oil cooler cavity (Fig. 5).

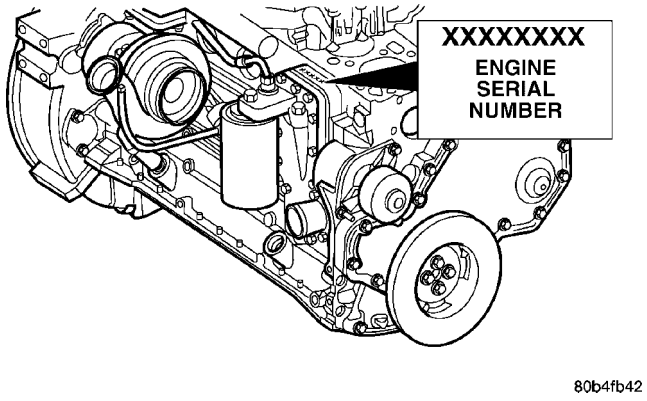

Fig. 5 Engine Serial Number Location

AIR CLEANER ELEMENT

REMOVAL

Testing Air Cleaner Element using Filter Minder™

Do not attempt to unnecessarily remove top of air cleaner housing for air cleaner element inspection on diesel engines.

The air cleaner (filter) housing is equipped with an air Filter Minder™ gauge (Fig. 6). This air flow restriction gauge will determine when air cleaner element is restricted and should be replaced.

The Filter Minder™ consists of a diaphragm and calibrated spring sealed inside of a plastic housing (Fig. 7). A yellow colored disc attached to diaphragm moves along a graduated scale on side of Filter Minder. After the engine has been shut off, a ratcheting device located within Filter Minder will hold yellow disc at highest restriction that air cleaner element has experienced. A drop in air pressure due to an air cleaner element restriction moves diaphragm and yellow disc will indicate size of air drop.

CAUTION: Certain engine degreasers or cleaners may discolor or damage plastic housing of Filter Minder. Cover and tape Filter Minder if any engine degreasers or cleaners are to be used.

To test, turn engine off. If yellow disc (Fig. 7) has reached red colored zone on graduated scale, air cleaner element should be replaced. Refer to Removal / Installation.

Resetting Filter Minder: After air cleaner (filter) element has been replaced, press rubber button on top of Filter Minder (Fig. 7). This will allow yellow colored disc to reset. After button has been pressed, yellow disc should spring back to UP position.

If Filter Minder gauge has reached red colored zone, and after an examination of air cleaner (filter) element, element appears to be clean, high reading may be due to a temporary condition such as snow build-up at air intake. Temporary high restrictions may also occur if air cleaner (filter) element has gotten wet such as during a heavy rain or snow. If this occurs, allow element to dry out during normal engine operation. Reset rubber button on top of Filter Minder and retest after element has dried.

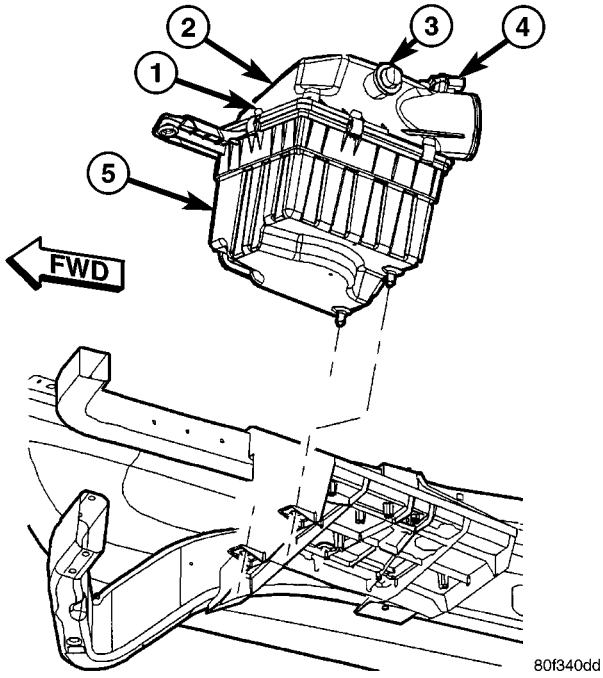

Fig. 6 5.9L DIESEL AIR CLEANER - FILTER MINDER™

2 - YELLOW DISC
3 - RED ZONE
4 - TO AIR FILTER HOUSING
5 - FILTER MINDER

Filter Removal

(1) The housing cover is equipped with spring clips (Fig. 6) and is hinged with plastic tabs. Unlatch clips from top of air cleaner housing and tilt housing cover up for cover removal.

(2) Remove air cleaner element from air cleaner housing.

INSTALLATION

(1) Before installing new air cleaner element (filter), clean inside of air cleaner housing.

(2) Position air cleaner cover to tabs on front of air cleaner housing. Latch spring clips to seal cover to housing.

CYLINDER HEAD

DESCRIPTION

The cylinder head is constructed of cast iron and is a one piece cross flow design with four valves per cylinder. The arrangement of two intake and two exhaust valves per cylinder allows for a centrally located injector. The cylinder head also includes an integral intake manifold, an integral thermostat housing, and a longitudal fuel return rifle, which exits at the rear of the head. The 24 valve design also includes integrally cast valve guides and hardened intake and exhaust valve seat inserts.

REMOVAL

(1) Disconnect battery negative cables.

(2) Raise vehicle on hoist.

(3) Drain engine coolant.

(4) Disconnect exhaust pipe from turbocharger elbow.

(5) Disconnect turbocharger oil drain tube at rubber hose connection. Cap off open ports to prevent intrusion of dirt or foreign material.

(6) Lower vehicle.

(7) Disconnect air inlet temperature/pressure sensor.

(8) Remove air cleaner housing and snorkel from the vehicle. Cap off turbocharger air inlet to prevent intrusion of dirt or foreign material.

(9) Disconnect cab heater core supply and return hoses from the cylinder head and heater pipe.

(10) Disconnect turbocharger oil supply line at the turbocharger end. Cap off open ports to prevent intrusion of dirt or foreign material.

(11) Remove exhaust manifold-to-cylinder head bolts, spacers, heat shield, retention straps, and cab heater plumbing. Remove exhaust manifold and turbocharger from the vehicle as an assembly.

(12) Remove cooling fan assembly.

(13) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(14) Remove cooling fan support from cylinder block.

(15) Remove upper generator bolt, loosen lower generator bolt, and rotate generator away from cylinder head.

(16) Disconnect radiator upper hose from the thermostat housing.

(17) Disconnect the Intake Air Temperature/Manifold Air Pressure, and Coolant Temperature sensor connectors.

(18) Remove the engine harness to cylinder head attaching bolts and P-clips at front of head.

(19) Remove the throttle linkage cover (Fig. 8).

(20) For automatic equipped vehicles only, remove the six (6) accelerator pedal position sensor assembly-to-cylinder head bracket bolts (Fig. 9) and secure the entire assembly out of the way. Disconnect the APPS connector (Fig. 10). **It is not necessary to disconnect the cables from the throttle control assembly.**

(21) Remove the intake air grid heater wires from the grid heater.

(22) Remove engine oil level indicator tube attaching bolt at fuel filter housing bracket and inlet air connection..

(23) Remove the charge air cooler-to-air inlet housing pipe.

CYLINDER HEAD (Continued)

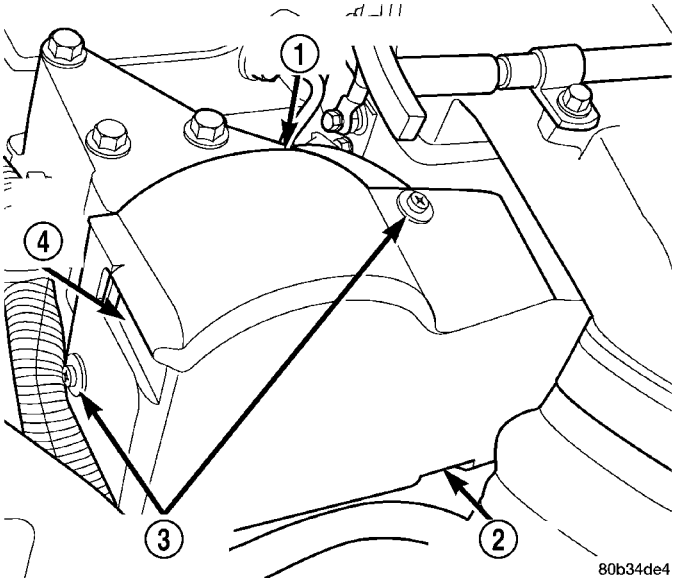

Fig. 8 Throttle Linkage Cover Auto Trans Only

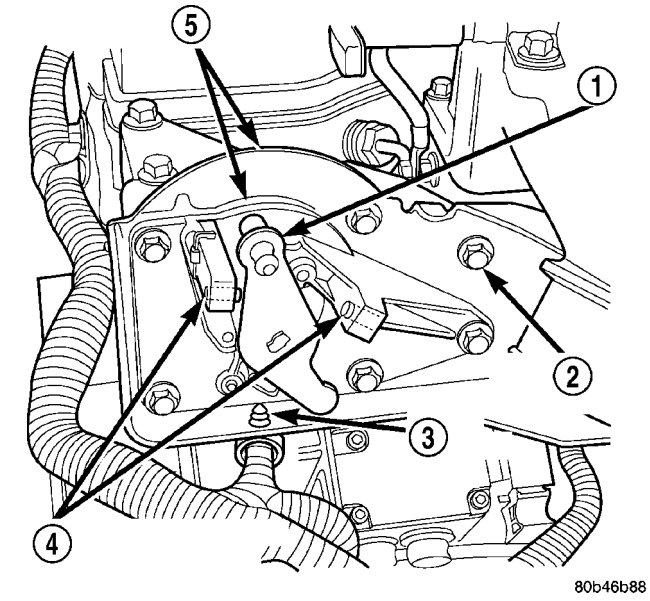

Fig. 9 APPS Assembly Auto Trans Only

1 - LEVER
2 - MOUNTING BOLTS (6)
3 - WIRE HARNESS CLIP
4 - CALIBRATION SCREWS (NO ADJUSTMENT)
5 - APPS ASSEMBLY

(24) Remove the engine wire harness attaching bolt and wire harness push-in fastener from air inlet housing.

(25) Remove the air inlet housing and intake grid heater from the intake manifold cover.

(26) Remove the two grid heater harness-to-cylinder head attaching bolts at front of cylinder head.

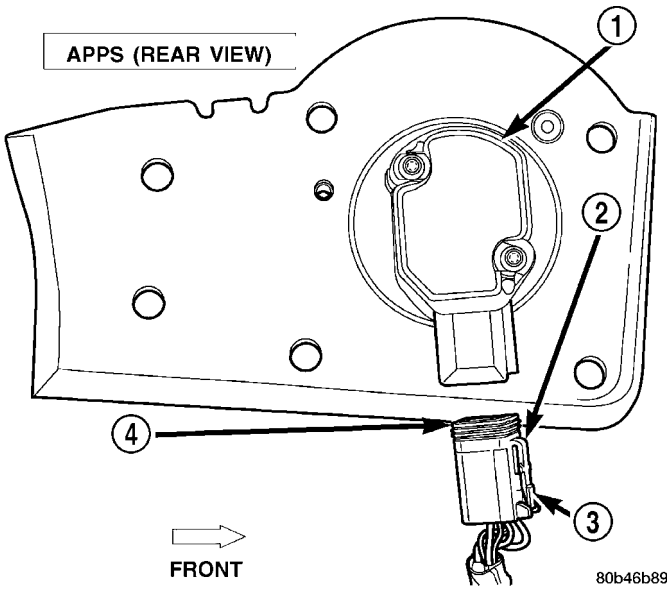

Fig. 10 APPS Connector Auto Trans Only

1 - APPS
2 - TAB
3 - PUSH FOR REMOVAL
4 - APPS CONNECTOR

(27) Remove the engine lift bracket from the rear of the cylinder head.

(28) **Remove the high pressure pump to fuel rail fuel line as follows:**

(a) Loosen fuel line nuts at fuel pump and at fuel rail.

(b) Use a back-up wrench on the fitting at the fuel pump to keep it from loosening.

(29) Remove the fuel rail to cylinder head fuel lines as follows:

(a) Loosen No. 6 high pressure fuel line shield and position out of way.

(b) Loosen the fuel line nuts at the fuel rail and at the cylinder head.

(c) Remove the fuel line bracket bolts at the intake manifold cover.

(30) Remove the fuel rail as follows:

(a) Remove fuel rail pressure sensor connector.

(b) Remove banjo fitting at pressure limiting valve.

(c) Remove fuel rail bolts and fuel rail.

(31) Remove the low pressure lines as follows:

(a) Remove the fuel drain banjo fitting on the front side of fuel filter housing.

(b) Remove the fuel drain banjo fitting on rear side of fuel filter housing.

(c) Remove the fuel drain line support bracket on rear side of filter housing.

(d) Disconnect fuel drain hose.

(e) Remove banjo fitting at bottom of fuel filter housing.

(f) Disconnect fuel supply hose at lift pump.

CYLINDER HEAD (Continued)

(32) Disconnect fuel heater, water in fuel sensor, and fuel lift pump connectors.

(33) Remove the fuel filter assembly-to-cylinder head bolts and remove filter assembly from vehicle.

(34) Remove wire harness P-clip from cylinder head (located behind filter housing).

(35) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(36) Disconnect rocker housing injector harness connectors.

(37) Remove injector harness nuts from injectors.

(38) Remove the rocker levers (Fig. 11), cross heads and push rods (Fig. 12). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder exhaust and the #6 cylinder intake and exhaust push rods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

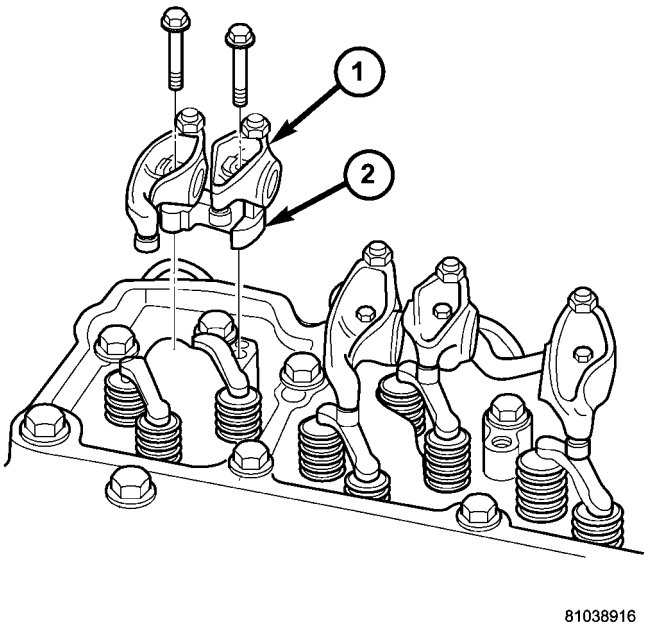

Fig. 11 Rocker Arm and Pedestal Removal

1 - ROCKER ARM
2 - PEDESTAL

(39) Remove the fuel return line and banjo bolt at the rear of the cylinder head. Be careful not to drop the two (2) sealing washers.

(40) Remove the fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).

(41) Remove rocker housing bolts and rocker housing and gasket.

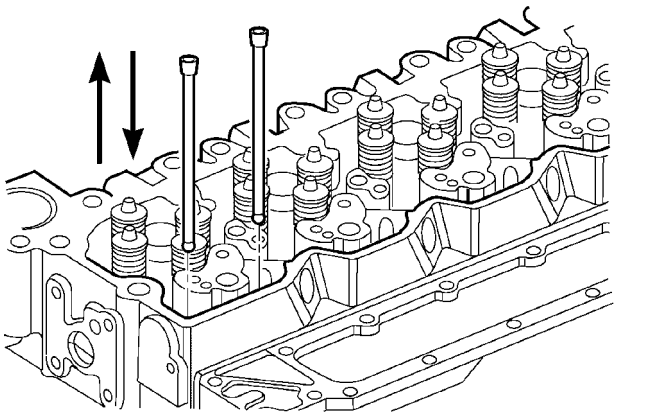

Fig. 12 Push Rod Removal

(42) Reinstall the engine lift bracket at the rear of cylinder head. Torque to 77 N·m (57 ft. lbs.).

(43) Remove twenty six (26) cylinder head-to-block bolts.

(44) Attach an engine lift crane to engine lift brackets and lift cylinder head off engine and out of vehicle.

(45) Remove the head gasket and inspect for failure.

CLEANING

CLEANING—CYLINDER HEAD

CAUTION: Do not wire brush head surface while fuel injectors are still installed. Fuel injector damage can result.

Remove fuel injector before cleaning (if not already removed during cylinder head removal).

Clean the carbon from the injector nozzle seat with a nylon or brass brush.

Scrape the gasket residue from all gasket surfaces.

Wash the cylinder head in hot soapy water solution (88°C or 140°F).

After rinsing, use compressed air to dry the cylinder head.

Polish the gasket surface with 400 grit paper. Use an orbital sander or sanding block to maintain a flat surface.

CLEANING—CROSSHEADS

Clean all crossheads in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air.

CYLINDER HEAD (Continued)

CLEANING—PUSHRODS

Clean the pushrods in a suitable solvent. Rinse in hot water and blow dry with compressed air. If necessary, use a wire brush or wheel to remove stubborn deposits.

INSPECTION

INSPECTION - CYLINDER HEAD

Inspect the cylinder head for cracks in the combustion surface. Pressure test any cylinder head that is visibly cracked. A cylinder head that is cracked between the injector bore and valve seat can be pressure tested and reused if OK; however, if the crack extends **into** the valve seat insert bore, the cylinder head **must** be replaced.

Visually inspect the cylinder block and head combustion surfaces for localized dips or imperfections. Check the cylinder head and block combustion surfaces for overall out-of-flatness. If either the visual or manual inspection exceeds the limits, then the head or block must be surfaced.

Check the top surface for damage caused by the cylinder head gasket leaking between cylinders.

Inspect the block and head surface for nicks, erosion, etc.

Check the head distortion. Maximum overall variation end to end is 0.305 mm (0.012 inch) (Fig. 13), and maximum overall variation side to side 0.076 mm (.003 in.).

DO NOT proceed with the in-chassis overhaul if the cylinder head or block surface is damaged or not flat (within specifications).

Check block surface for distortion. Maximum variation end-to-end is 0.076 mm (.003 in.), side-to-side 0.051 mm (.002).

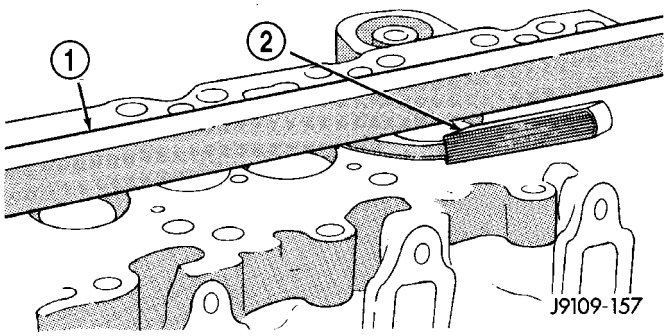

Fig. 13 Cylinder Head Combustion Deck Face

1 - STRAIGHT EDGE
2 - FEELER GAUGE

Visually inspect the cylinder head bolts for damaged threads, corroded/pitted surfaces, or a reduced diameter due to bolt stretching.

If the bolts are not damaged, their “free length” should be measured using the cap screw stretch gauge provided with the replacement head gasket. Place the head of the bolt against the base of the slot and align the bolt with the straight edge of gauge (Fig. 14). If the end of the bolt touches the foot of the gauge, the bolt **must** be discarded. **The maximum bolt free length is 132.1 mm (5.200 in.).**

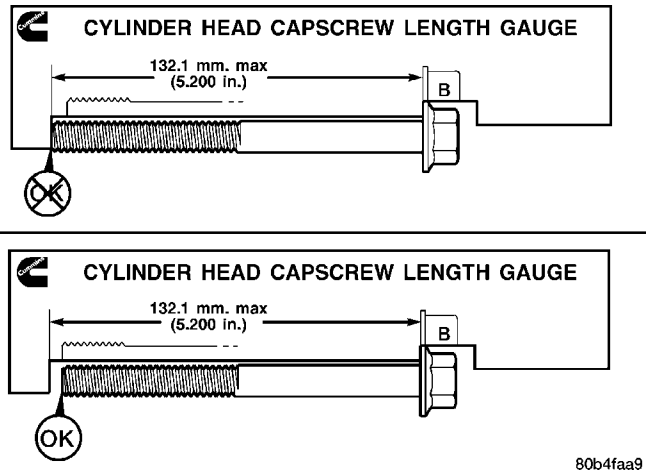

Fig. 14 Head Bolt Stretch Gauge

INSPECTION—CROSSHEADS

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 15). Replace any crossheads that exhibit abnormal wear or cracks.

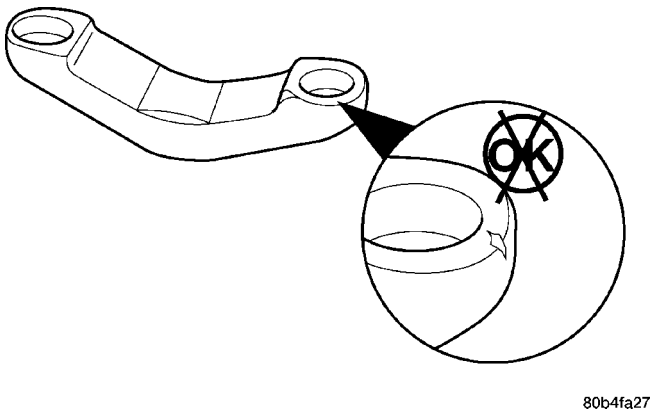

Fig. 15 Inspecting Crosshead for Cracks

CYLINDER HEAD (Continued)

INSPECTION—PUSHRODS

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 16).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 17). Replace any push rod that appears to be bent.

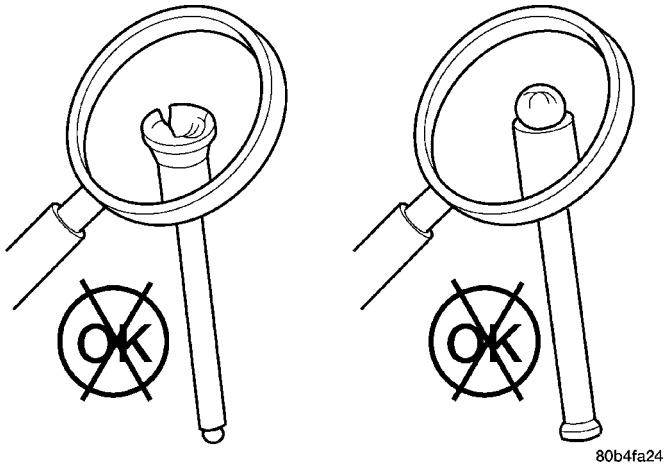

Fig. 16 Inspecting Push Rod for Cracks

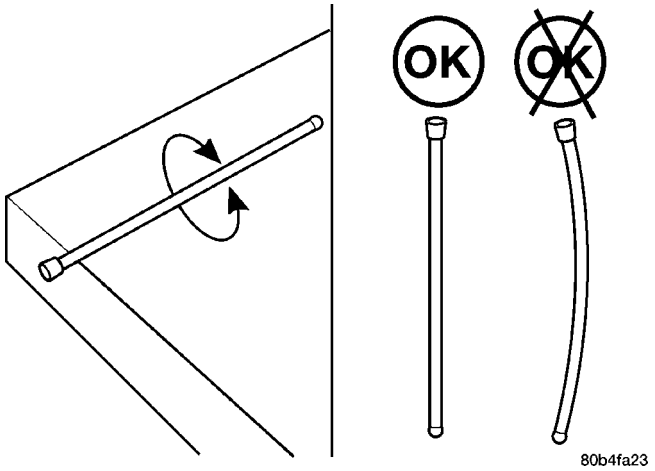

Fig. 17 Inspecting Push Rod for Flatness

INSTALLATION

WARNING: THE OUTSIDE EDGE OF THE HEAD GASKET IS VERY SHARP. WHEN HANDLING THE NEW HEAD GASKET, USE CARE NOT TO INJURE YOURSELF.

(1) Install a new gasket with the part number side up, and locate the gasket over the dowel sleeves.

(2) Using an engine lifting crane, lower the cylinder head onto the engine.

(3) Lightly lubricate head bolts with engine oil and install. Using the sequence shown in (Fig. 18), tighten bolts in the following steps:

(a) Torque bolts to 70 N·m (52 ft. lbs.)

(b) Back off 360 degrees in sequence

(c) Torque bolts to 105 N·m (77 ft. lbs.)

(d) Re-check all bolts to 105 N·m (77 ft. lbs.)

(e) Tighten all bolts an additional ¼ turn (90°)

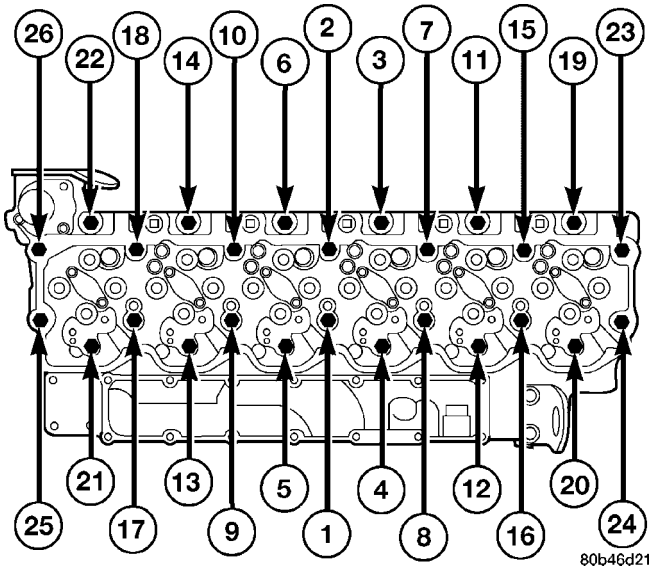

Fig. 18 Cylinder Head Bolt Torque Sequence

(4) Install push rods into their original locations (Fig. 19). **Verify that they are seated in the tappets**.

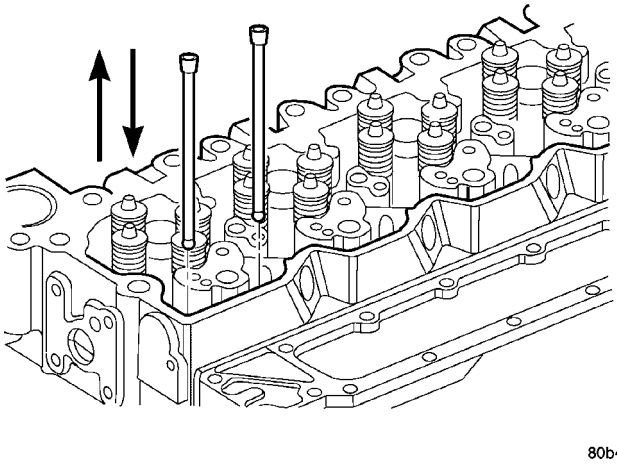

Fig. 19 Push Rod Installation

(5) Lubricate valve stem tips and install the crossheads in their original locations.

(6) Lubricate the rocker arms and pedestals and install them in their original locations (Fig. 20). Install the bolts and torque them to 36 N·m (27 ft. lbs.).

(7) Verify that the valve lash settings are maintained (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).

(8) Inspect rocker housing gasket for cuts and proper installation into groove. Replace if damaged.

CYLINDER HEAD (Continued)

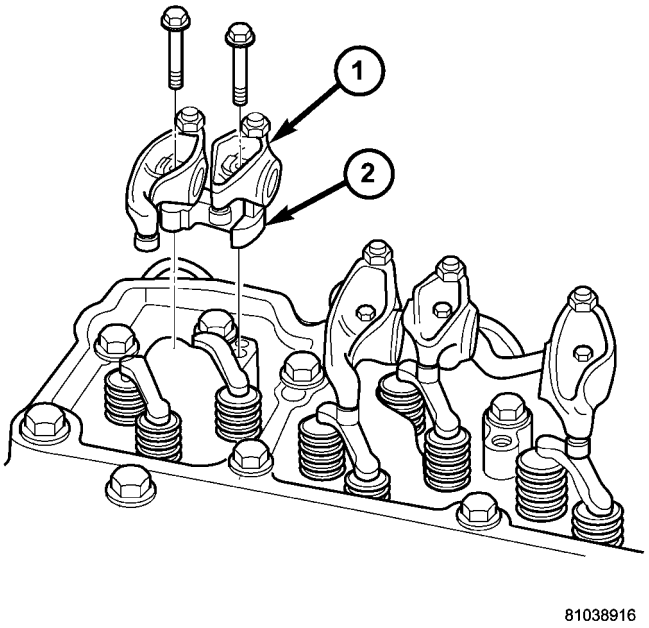

Fig. 20 Rocker Arm and Pedestal Removal

1 - ROCKER ARM
2 - PEDESTAL

(9) Install rocker housing and bolts. Tighten to 24 Nm (18 lb. ft.).

(10) Install fuel injector(Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).

(11) Install injector harness nuts. Tighten to 1.25 Nm (11 lb. in.).

(12) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Install wire harness P-clip to cylinder head behind filter housing 24 N·m (18 ft. lbs.).

(14) Connect the IAT/MAP sensor connector.

(15) Install the fuel filter canister assembly and torque mounting bolts to 24 N·m (18 ft. lbs.).

(16) Connect fuel lift pump, WIF sensor, and fuel heater.

(17) Remove the engine lift bracket at rear of cylinder head.

CAUTION: Failure to follow procedure will result in fuel leaks and/or fuel system failure.

(18) **Install the fuel rail and high pressure fuel lines as follows:**

(a) Hand tighten fuel rail bolts.

(b) Hand tighten fuel drain line to pressure limiting valve. Hand tighten banjo bolt at fuel filter housing.

(c) Hand tighten fuel rail-to-cylinder head high pressure fuel lines.

(d) Install fuel line brace bolts-to-intake manifold finger tight.

(e) Hand tighten fuel pump to fuel rail line.

(f) Torque fuel line nuts at cylinder head to 30 Nm (22 ft. lbs.).

(g) Torque fuel line nuts at fuel rail to 30 Nm (22 ft. lbs.)

(h) Using a back up wrench, torque fuel pump to fuel rail line to 37 Nm (27 ft. lbs.). At injection pump.

(i) Torque fuel pump to fuel rail line to 37 Nm (27 ft. lbs.) at fuel rail.

(j) Torque fuel drain banjo bolt at pressure limiting valve and front of fuel filter housing to 24 Nm (18 ft. lbs.).

(k) Torque fuel line brace bolts to 24 N·m (18 ft. lbs.).

(l) Torque rail bolts to 24 Nm (18 ft. lbs.).

(m) Connect fuel pressure sensor.

(19) Install the engine lift bracket at the rear of cylinder head. Torque to 77 N·m (57 ft. lbs.).

(20) Reposition number 6 fuel line shield and torque to 43 N·m (32 ft. lbs.).

(21) Install the fuel filter to injection pump low pressure line. Inspect and replace sealing washers if necessary. Torque banjo bolts to 24 N·m (18 ft. lbs.).

(22) Connect fuel return line at back of cylinder head hand tight.

(23) Connect fuel return line at filter housing hand tight.

(24) Torque banjo connections at cylinder head and fuel filter housing to 24 Nm (18 ft. lbs.)

(25) Install bracket to rear of filter housing. Torque to 24 Nm (18 ft. lbs.).

(26) Using new gaskets, install the intake grid heater and air inlet housing. Torque bolts to 24 N·m (18 ft. lbs.).

(27) Install wire harness P-clip and push on clip to air inlet housing.

(28) Connect engine oil level indicator tube at fuel filter housing and at air inlet housing.

(29) Connect the APPS connector.

(30) Install the APPS assembly to the cylinder head bracket and torque bolts to 24 N·m (18 ft. lbs.).

(31) Install the throttle linkage cover.

(32) Install the charge air cooler-to-air inlet housing duct assembly. Torque all clamps to 11 N·m (100 in. lbs.).

(33) Connect intake grid heater wires.

(34) Secure engine harness to front of cylinder head with bolt at four locations.

(35) Connect engine coolant temperature sensor connector.

(36) Connect radiator upper hose to thermostat housing.

CYLINDER HEAD (Continued)

(37) Rotate generator into position. Install upper bolt and torque upper and lower bolts.
(38) Install wire harness push-on clip below bracket.
(39) Install wire harness P-clip to top of bracket.
(40) Install fan support and torque to 32 N·m (24 ft. lbs.).
(41) Install cooling fan/drive refer to (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(42) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(43) Install exhaust manifold/turbocharger assembly, using new gaskets. Start all bolts/spacers by hand. Torque bolts to 43 N·m (32 ft. lbs.).
(44) Install exhaust manifold heat shield to exhaust manifold studs. Install retaining nuts.Torque to 15 N·m (11 ft. lbs.).
(45) Install exhaust bolt retention straps across cylinders 5 & 6.
(46) Connect turbocharger oil drain tube. Torque clamp to 8 N·m (71 in. lbs.).
(47) Perform the turbocharger pre-lube procedure. Refer to Group 11, Exhaust System and Turbocharger for the correct procedure.
(48) Connect the turbocharger oil supply line. Torque to 24 N·m (18 ft. lbs.).
(49) Install air cleaner housing and duct.
(50) Connect air inlet temperature/pressure sensor.
(51) Raise vehicle on hoist.
(52) Install exhaust pipe to turbocharger elbow. Torque bolts to 11 N·m (100 in. lbs.).
(53) Lower vehicle.
(54) Fill engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
(55) Start engine and check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

REMOVAL—CYLINDER HEAD COVER

(1) Disconnect both battery negative cables.
(2) Remove oil fill cap.
(3) Remove the breather cover.
(4) Disconnect the breather hose and breather drain tube from the breather housing.
(5) Remove cylinder head cover bolts.
(6) Remove the cylinder head cover.

REMOVAL—ROCKER HOUSING

(1) Remove cylinder head cover as outlined in this section.
(2) Disconnect rocker housing injector harness connectors.
(3) Remove injector harness nuts from injectors.
(4) Remove rocker housing bolts.
(5) Remove rocker housing and gasket.

CLEANING

Using a suitable solvent, Clean and dry gasket mating surfaces on cylinder head and rocker housing. Wipe gasket dry and inspect for re-use.

INSPECTION

The cylinder head cover gasket and rocker housing gasket, are reusable. However, should cracks, nicks, or tears be present in the rubber/silicone construction, the defective components should be replaced. Also replace gasket if it is no longer flexible. Inspect o-rings on cylinder head cover bolts. **Do not reuse gasket if it has been removed from the groove in the rocker housing or cylinder head cover.**

INSTALLATION

INSTALLATION—CYLINDER HEAD COVER

(1) Inspect cylinder head cover gasket for cuts and proper installation in groove. Replace if damaged.
(2) Position cylinder cover on top of rocker housing.
(3) Install bolts.
(4) Starting with the center bolt, torque to 24 N·m (18 ft. lbs.).
(5) Install breather hose to breather.
(6) Install breather drain hose to breather.
(7) Install breather cover and wire harness clip. Torque to 24 N·m (18 ft. lbs.).

INSTALLATION - ROCKER HOUSING

(1) Inspect rocker housing gasket for cuts, nicks, or tears. Replace if damaged or if gasket has come out of groove.
(2) Inspect rocker housing gasket for proper installation in groove. Gasket bead must be centered in groove. A gasket bead that is tilted to the side will cause an oil leak.

CAUTION: When installing rocker housing onto cylinder head, do not slide housing from side to side, The gasket could fall out or be damaged.

(3) Install the rocker housing. Carefully guide the rocker housing evenly down onto the cylinder head.
(4) Install rocker housing bolts and tighten finger tight.
(5) Torque bolts, working from center out, to 24 Nm (18ft. lbs.).
(6) Install injector harness nuts to injector solenoid. Torque to 1.25 Nm (11 in. lbs.).
(7) Connect rocker housing injector harness connections.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel, and have chrome plated stems to prevent scuffing. The intake and exhaust valves are both similar in head diameter and overall length, but they have unique face angles which makes them non-interchangeable. The valves are distinguished by unique dimples on the exhaust valve head (Fig. 21).

The exhaust valve springs are made from high strength, chrome silicon steel. The exhaust valve springs are also exhaust brake compatible.

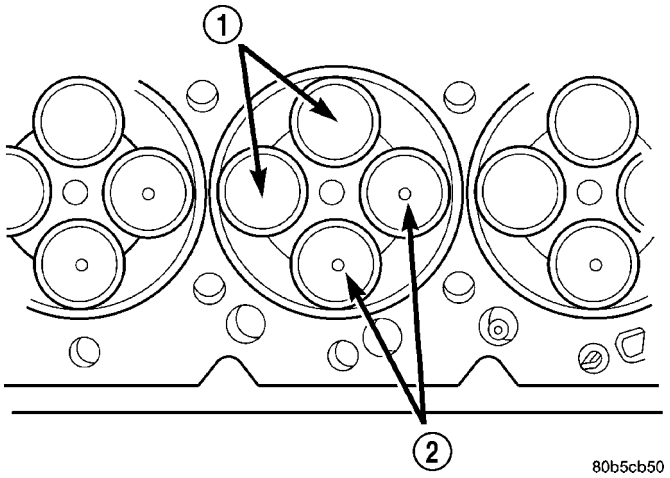

Fig. 21 Valve Identification

1 - INTAKE VALVES
2 - EXHAUST VALVES

STANDARD PROCEDURE

STANDARD PROCEDURE - VALVES, GUIDES AND SPRINGS

REMOVAL

(1) Remove cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

(2) Support cylinder head on stands, or install head bolts upside down (through combustion surface side) to protect injector tips from damage from work bench.

(3) Install the valve spring compressor mounting base as shown in (Fig. 22).

(4) Install the compressor top plate, washer, and nut. Using a suitable wrench, tighten the nut (clockwise) to compress the valve springs (Fig. 23) and remove the locks.

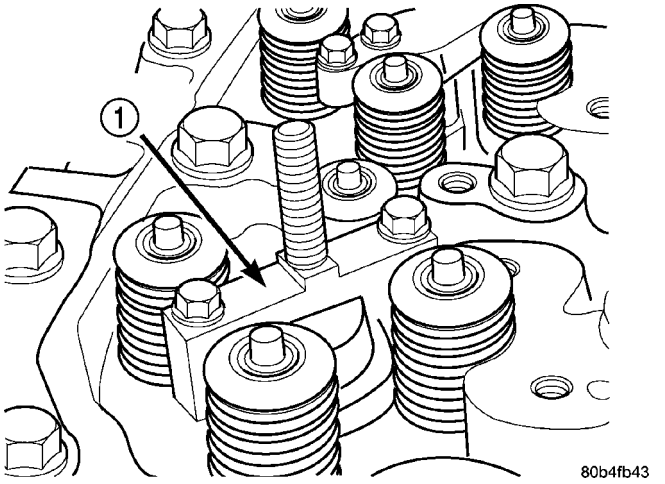

Fig. 22 Spring Compressor Mounting Base—Part of Tool 8319–A

1 - COMPRESSOR MOUNTING BASE

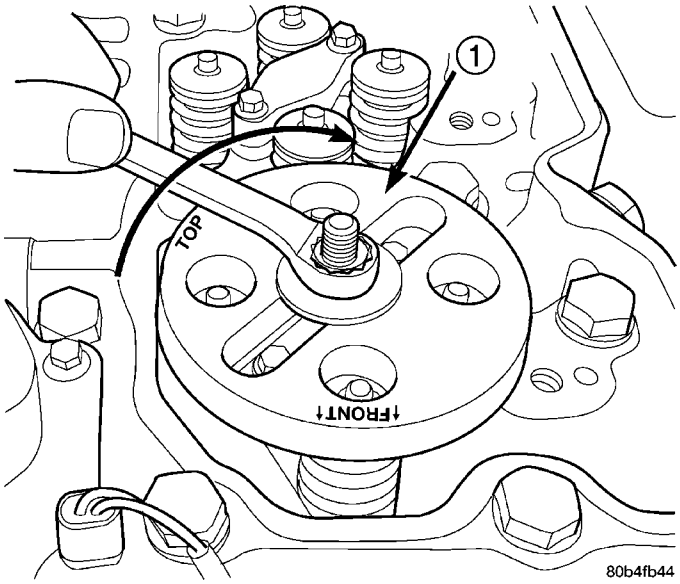

Fig. 23 Compressing Valve Springs with Tool 8319–A

1 - SPECIAL TOOL 8319

INTAKE/EXHAUST VALVES & SEATS (Continued)

(5) Rotate the compressor nut counter-clockwise to relieve tension on the springs. Remove the spring compressor.

(6) Remove the retainers, springs, valve seals (if necessary), and valves (Fig. 24). Arrange or number all components so they can be installed in their original locations.

(7) Repeat the procedure on all cylinders to be serviced.

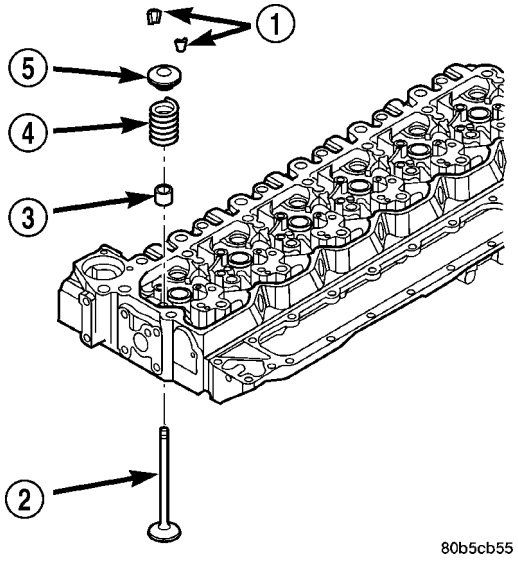

Fig. 24 Valve Spring, Seal, and Retainers

1 - VALVE RETAINING LOCKS
2 - VALVE
3 - SEAL
4 - SPRING
5 - RETAINER

CLEANING

Clean the valve stems with crocus cloth or a Scotch-Brite™ pad. Remove carbon with a soft wire brush. Clean valves, springs, retainers, and valve retaining locks in a suitable solvent. Rinse in hot water and blow dry with compressed air.

INSPECTION

Visually inspect the valves for abnormal wear on the heads, stems, and tips. Replace any valve that is worn out or bent (Fig. 25).

Measure the valve stem diameter in three places as shown in (Fig. 26).

Measure the cylinder head valve guide bore (Fig. 27).

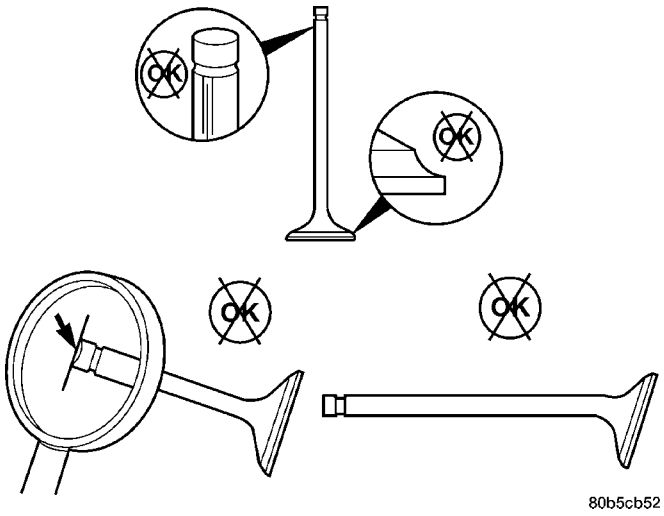

Fig. 25 Visually Inspect Valves for Abnormal Wear

INTAKE/EXHAUST VALVES & SEATS (Continued)

INSTALLATION

(1) Install new valve seals. The yellow seals are for the intake valves and the green seals are for the exhaust valves.

(2) Install the valves in their original postion. The exhaust valves are identified by a dimple on the valve head (Fig. 31).

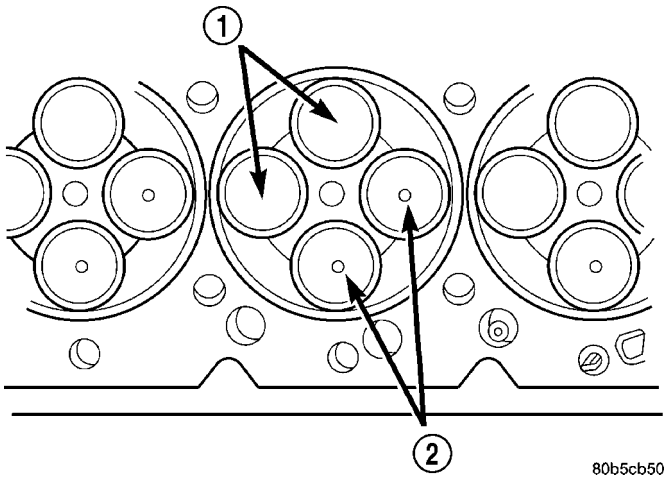

Fig. 31 Valve Identification

1 - INTAKE VALVES
2 - EXHAUST VALVES

(3) Install the valve springs and retainer.

(4) Install the valve spring compressor tool 8319–A as shown in (Fig. 22) and (Fig. 23).

(5) Compress the valve springs and install the valve retaining locks (Fig. 24).

(6) Remove the compressor and repeat the procedure on the remaining cylinders.

(7) Install new o-ring and sealing washer on injector.

(8) Lubricate o-ring and injector bore.

(9) Verify sealing washer (shim) was removed with old injector.

(10) Install injector Refer to (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).

(11) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

STANDARD PROCEDURE - VALVE LASH ADJUSTMENT AND VERIFICATION

NOTE: To obtain accurate readings, valve lash measurements AND adjustments should only be performed when the engine coolant temperature is less than 60° C (140° F).

The 24–valve overhead system is a “low-maintenance” design. Routine adjustments are no longer necessary, however, measurement should still take place when trouble-shooting performance problems, or upon completion of a repair that includes removal and installation of the valve train components or injectors.

(1) Disconnect battery negative cables.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Using the crankshaft barring tool #7471–B, rotate crankshaft to align damper TDC mark to 12:00 o’clock position.

(a) If both number one cylinder rocker levers are loose, continue to next step.

(b) If both number one clylinder rocker levers are not loose, rotate crankshaft 360 degrees.

(4) With the engine in this position, valve lash can be measured at the following rocker arms: **INTAKE 1–2–4 / EXHAUST 1–3–5**. Measure the valve lash by inserting a feeler gauge between the rocker arm socket and crosshead (Fig. 32). Refer to VALVE LASH LIMIT CHART for the correct specifications. If the measurement falls **within** the limits, adjustment/resetting **is not** necessary. If measurement finds the lash **outside** of the limits, adjustment/resetting **is** required.

VALVE LASH LIMIT CHART

INTAKE	EXHAUST
0.152 mm (0.006 in.) MIN.	0.381 mm (0.015 in.) MIN.
0.381 mm (0.015 in.) MAX.	0.762 mm (0.030 in.) MAX.

note:
If measured valve lash falls within these specifications, no adjustment/reset is necessary. Engine operation within these ranges has no adverse affect on performance, emissions, fuel economy or level of engine noise.

(5) If adjustment/resetting is required, loosen the lock nut on rocker arms and turn the adjusting screw until the desired lash is obtained:

- **INTAKE** 0.254 mm (0.010 in.)
- **EXHAUST** 0.508 mm (0.020 in.) Tighten the lock nut to 24 Nm (18 ft. lbs.) and re-check the valve lash.

(6) Using the crankshaft barring tool, rotate the **crankshaft** one revolution (360°) to align the damper TDC mark to the 12 o’clock position.

INTAKE/EXHAUST VALVES & SEATS (Continued)

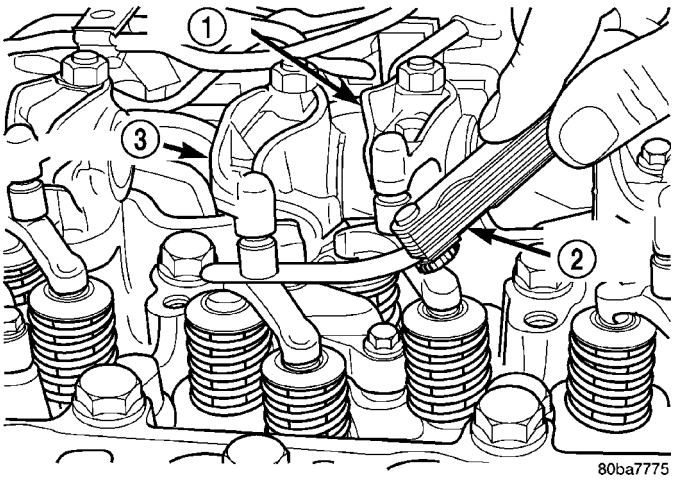

Fig. 32 Measuring Valve Lash - Typical

1 - INTAKE
2 - FEELER GAUGE
3 - EXHAUST

(7) With the engine in this position, valve lash can be measured at the remaining rocker arms: **INTAKE 3–5–6 / EXHAUST 2–4–6** . Use the same method as above for determining whether adjustment is necessary, and adjust those that are found to be outside of the limits.

(8) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(9) Connect the battery negative cables.

REMOVAL - VALVE SPRINGS AND SEALS

(1) Disconnect the battery negative cables.

(2) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Disconnect rocker housing injector harness connector. Remove all injector harness solenoid nuts.

(4) Remove injector(s) for cylinder(s) to be serviced. Refer to Group 14 for injector removal.

(5) Remove the rocker housing.

(6) Remove the rocker arms and crossheads from the cylinder(s) to be serviced. Mark each component so they can be installed in their original position.

(7) Using the crankshaft barring tool #7471–B (Fig. 33), rotate the engine to position the damper mark in the 12 o'clock position. **At this engine position, cylinders #1 and #6 can be serviced.**

(8) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(9) With the damper TDC mark in the 12 o'clock position, add a paint mark anywhere on the gear housing cover next to the crankshaft damper. Place another mark on the vibration damper in alignment with the mark you just made on the cover.

(10) Divide the crankshaft damper into three equally sized segments as follows:

(a) Using a tape measure, measure the circumference of the crankshaft damper and divide the measurement by three (3).

(b) Measure that distance in a counter-clockwise direction from the first balancer mark and place another mark on the balancer.

(c) From the second damper mark, again measure in a counter-clockwise direction and place a mark on the damper at the same distance you measured when placing the second damper mark. The damper should now be marked in three equally spaced locations and the damper TDC mark should be in the 12 o'clock position.

(d) Remove injectors, fuel lines, and high pressure connectors for every cylinder that requires repair.

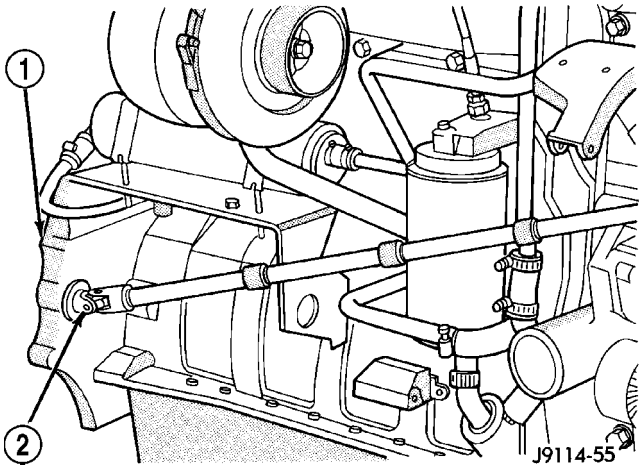

Fig. 33 Rotating Engine with Barring Tool - Typical

1 - REAR FLANGE
2 - BARRING TOOL

(11) Compress the valve springs at cyls. #1 and #6 as follows:

(a) Install the valve spring compressor mounting base as shown in (Fig. 34).

(b) Install the top plate, washer, and nut. Using a suitable wrench tighten the nut (clock-wise) (Fig. 35) to compress the valve springs and remove the collets.

(c) Rotate the compressor nut counter-clockwise to relieve tension on springs. Remove spring compressor.

(d) Remove and replace retainers, springs, and seals as necessary.

(e) **Do not rotate the engine until the springs and retainers are re-installed.**

(f) Install seals, springs and retainers. Install spring compressor, compress valve springs and install the collets.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(g) Release the spring tension and remove the compressor. Verify that the collets are seated by tapping on the valve stem with a plastic hammer.

(12) Using the crankshaft barring tool, rotate the engine until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #2 and #5 can be serviced.**

(13) Repeat the valve spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

(14) Using the crankshaft barring tool, rotate the engine until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #3 and #4 can be serviced.**

(15) Repeat the spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

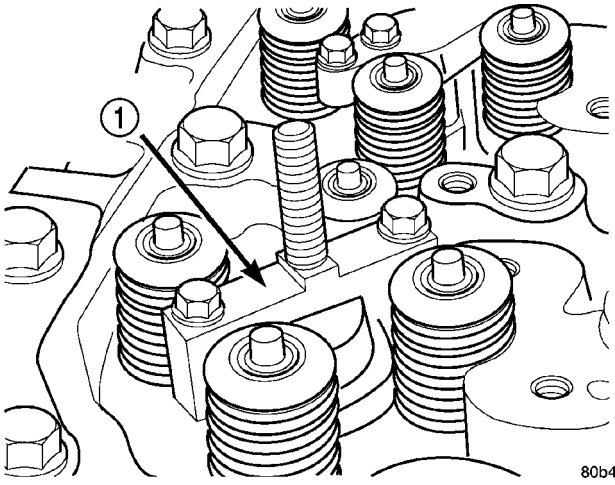

Fig. 34 Spring Compressor Mounting Base—Part of Tool 8319–A

1 - COMPRESSOR MOUNTING BASE

INSTALLATION

(1) Install rocker housing.

(2) Install fuel injectors and high pressure fuel lines.

(3) Lubricate the valve tips and install the crossheads in their original locations.

(4) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals in their original locations. Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(5) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(6) Install cylinder head cover and reusable gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(7) Connect battery negative cables.

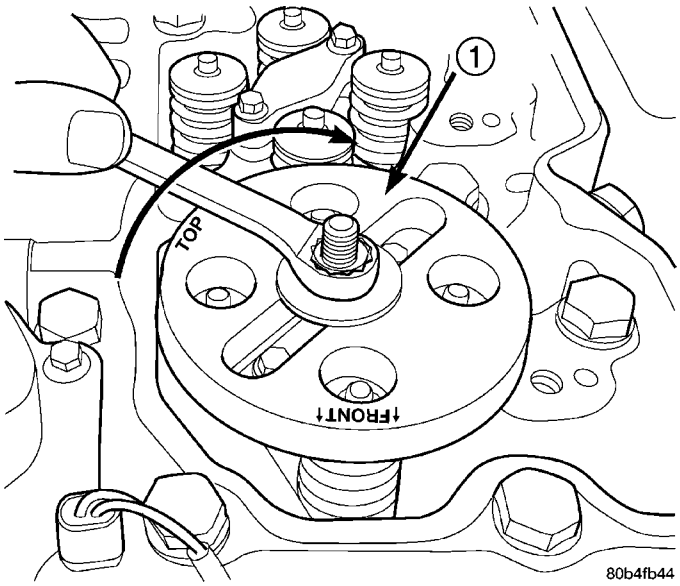

Fig. 35 Compressing Valve Springs with Tool 8319–A

1 - SPECIAL TOOL 8319

ROCKER ARM / ADJUSTER ASSY

DESCRIPTION

The unique intake and exhaust rocker arms have their own rocker shafts and are lubricated by passages intersecting the cylinder block main oil rifle. Crossheads are used, which allow each rocker arm to operate two valves.

The solid push rods are hardened at the rocker arm and tappet contact areas for superior strength and durability.

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the rocker arm/pedestal fasteners (Fig. 36) and remove rocker arm and pedestal from cylinder head. Mark the arms and pedestals so they can be installed in their original position.

CAUTION: When removing the rocker arms, the sockets (Fig. 37) may come loose and fall into the engine. Make sure they stay with the arm upon removal/installation.

(4) Lift the push rod(s) up and out of the engine (Fig. 38). Mark them so they can be installed in their original position.

ROCKER ARM / ADJUSTER ASSY (Continued)

NOTE: The #5 cyl. intake and exhaust and #6 cyl. intake and exhaust push rods must be raised through the provided cowl panel access holes.

(5) Lift the crosshead(s) off of the valve stems. Mark them so they can be installed in their original position.

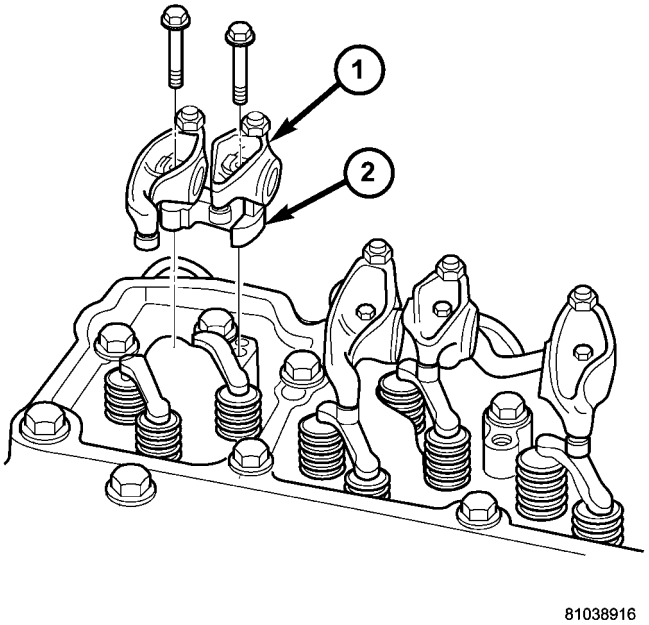

Fig. 36 Rocker Arm and Pedestal Removal

5 - SOCKET

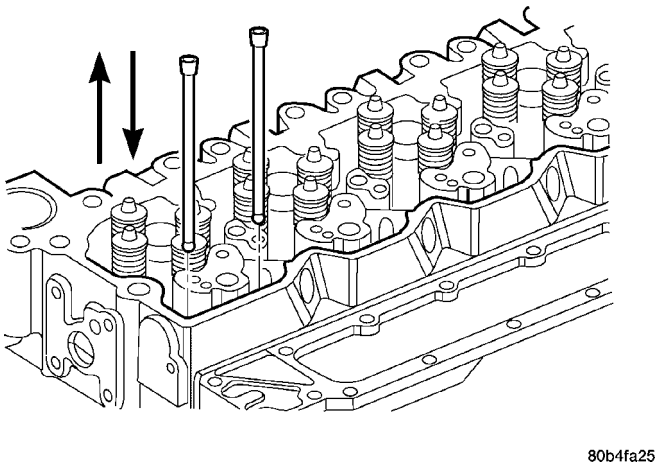

Fig. 38 Push Rod Removal/Installation

CLEANING

Clean all components in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air. Inspect oil passages in rocker arms and pedestals. Apply compressed air to lubrication orifices to purge contaminants.

INSPECTION

Rocker Arms

(1) Remove rocker shaft and inspect for cracks and excessive wear in the bore or shaft. Remove socket and inspect ball insert and socket for signs of wear. Replace retainer if necessary.

Measure the rocker arm bore and shaft (Fig. 39) (Fig. 40).

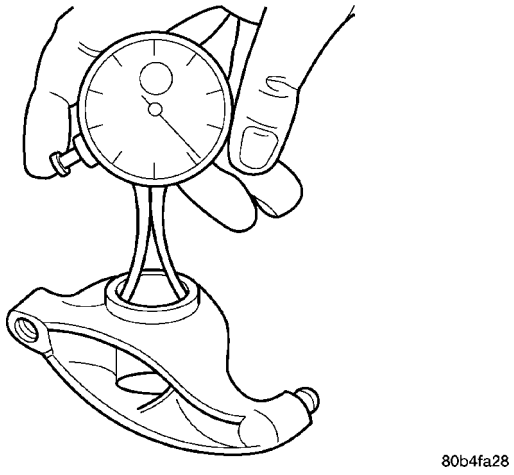

Fig. 39 Measuring Rocker Arm Bore

ROCKER ARM BORE (MAX.)
22.027 mm (.867 in.)

ROCKER ARM / ADJUSTER ASSY (Continued)

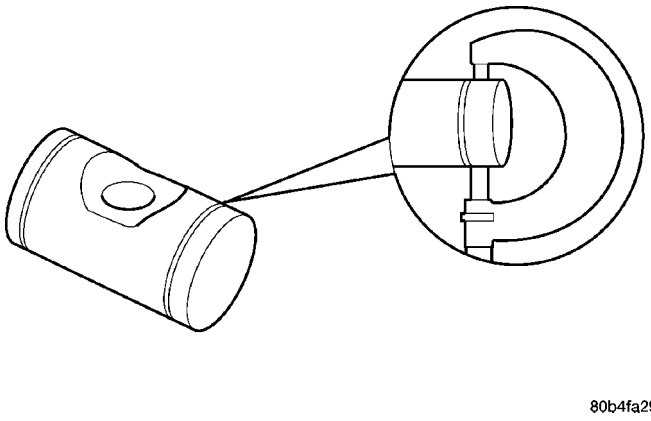

Fig. 40 Measuring Rocker Arm Shaft

ROCKER ARM SHAFT (MIN.)
21.965 mm (.865 in.)

Push Rods

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 41).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 42). Replace any push rod that appears to be bent.

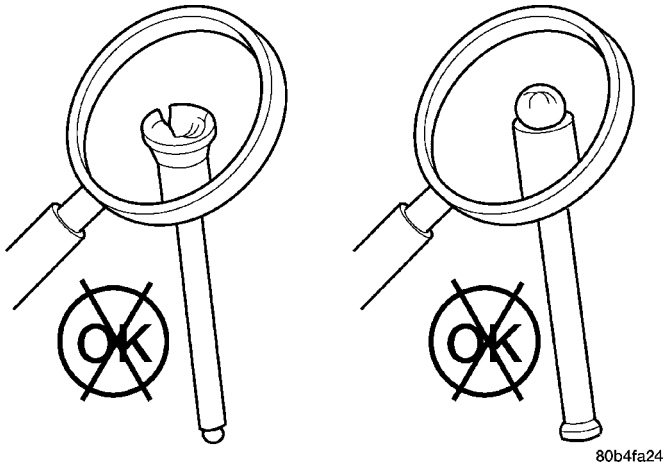

Fig. 41 Inspecting Push Rod for Cracks

Crossheads

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 43).

INSTALLATION

(1) If previously removed, install the push rods in their original location. **Verify that they are seated in the tappets.**

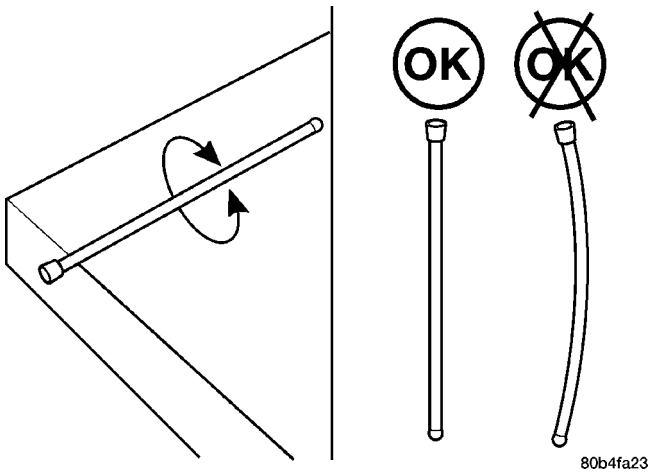

Fig. 42 Inspecting Push Rod for Flatness

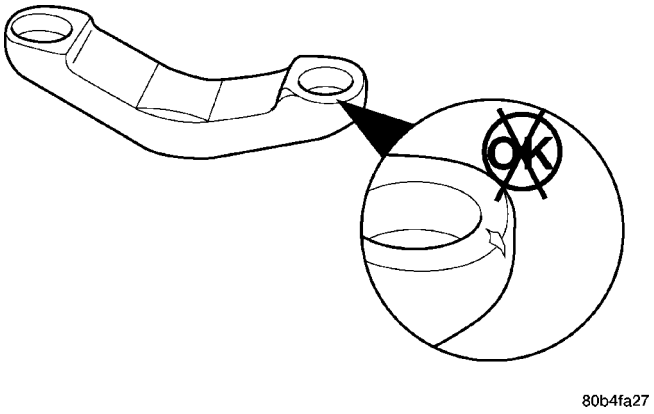

Fig. 43 Inspecting Crosshead for Cracks

(2) Lubricate the valve tips and install the crossheads in their original locations.

(3) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals in their original locations. Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(4) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(5) Install cylinder head cover and reusable gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Connect battery negative cables.

ENGINE BLOCK

STANDARD PROCEDURE

STANDARD PROCEDURE - CYLINDER BLOCK REFACING

(1) The combustion deck can be refaced twice. The first reface should be 0.25 mm (0.0098 inch). If additional refacing is required, an additional 0.25 mm (0.0098 inch) can be removed. Total allowed refacing is 0.50 mm (0.0197 inch) - (Fig. 44).

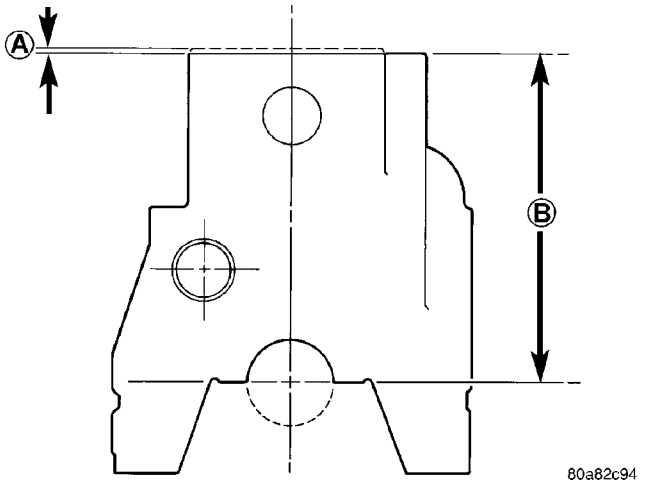

Fig. 44 Refacing Dimensions of the Cylinder Block

CYLINDER BLOCK REFACING DIMENSIONS

DIMENSION ″A″		
1st Reface	0.25mm	(0.0098 in.)
2nd Reface	0.25mm	(0.0098 in.)
Dim (A) Total	0.50 mm	(0.0197 in.)
		DIMENSION ″B″
Dim. ″B″ (STD.)	323.00 mm ± 0.10 mm	(12.7165 in. ± 0.0039 in.)
1st Reface	322.75 mm ± 0.10 mm	(12.7067 in. ± 0.0039 in.)
2nd Reface	322.50 mm ± 0.10 mm	(12.6968 in. ± 0.0039 in.)

(2) The upper right corner of the rear face of the block must be stamped with a X when the block is refaced to 0.25 mm (0.0098 inch). A second X must be stamped beside the first when the block is refaced to 0.50 mm (0.0197 inch) - (Fig. 45).

(3) Consult the parts catalog for the proper head gaskets which must be used with refaced blocks to ensure proper piston-to-valve clearance.

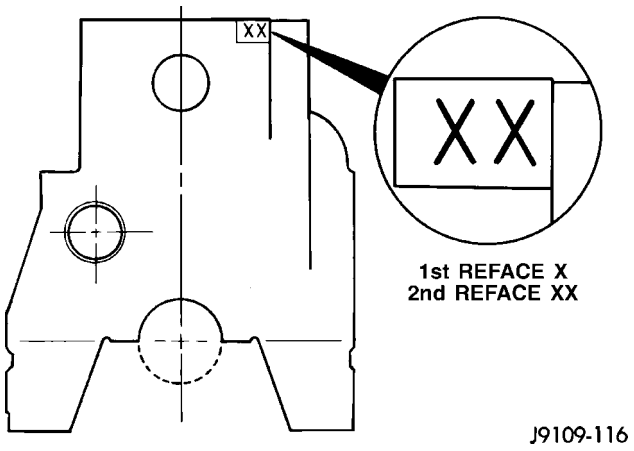

Fig. 45 Stamp Block after Reface

STANDARD PROCEDURE - CYLINDER BORE - DE-GLAZE

(1) New piston rings may not seat in glazed cylinder bores.

(2) De-glazing gives the bore the correct surface finish required to seat the rings. The size of the bore is not changed by proper de-glazing.

(3) Cover the lube and tappet holes in the top of the block with waterproof tape.

(4) It crankshaft is installed, wrap connecting rod journals with clean cloth. Cover cloth with waterproof tape.

(5) A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles (Fig. 46). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

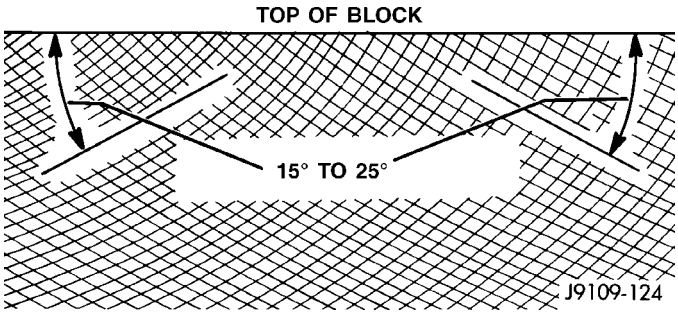

Fig. 46 Cylinder Bore Crosshatch Pattern

ENGINE BLOCK (Continued)

(6) Use a drill, a fine grit Flex-hone and a mixture of equal parts of mineral spirits and SAE 30W engine oil to de-glaze the bores.

(7) The crosshatch angle is a function of drill speed and how fast the hone is moved vertically (Fig. 47).

(8) Vertical strokes MUST be smooth continuous passes along the full length of the bore (Fig. 47).

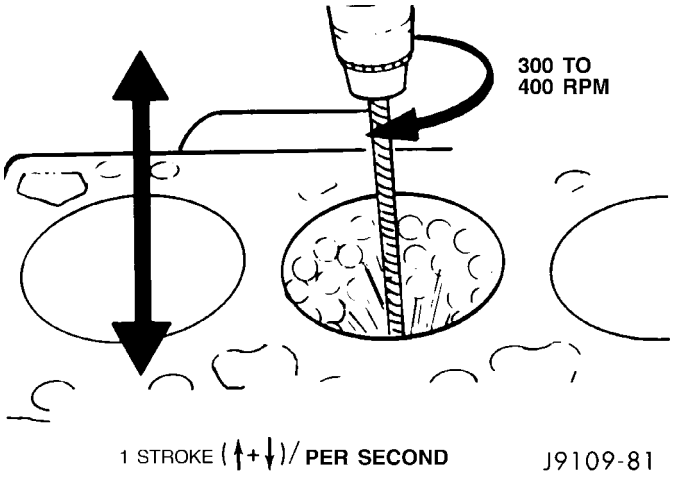

Fig. 47 De-Glazing Drill Speed and Vertical Speed

(9) Inspect the bore after 10 strokes.

(10) Use a strong solution of hot water and laundry detergent to clean the bores. Clean the cylinder bores immediately after de-glazing.

(11) Rinse the bores until the detergent is removed and blow the block dry with compressed air.

(12) Check the bore cleanliness by wiping with a white, lint free, lightly oiled cloth. If grit residue is still present, repeat the cleaning process until all residue is removed. Wash the bores and the complete block assembly with solvent and dry with compressed air. Place a clean shop towel around the top main bearing saddle to deflect water and residue from piston cooling nozzels. Remove directed piston cooling nozzles if installed.

(13) Be sure to remove the tape covering the lube holes, rod journals, and piston cooling nozzles after the cleaning process is complete.

STANDARD PROCEDURE—CYLINDER BORE REPAIR

Cylinder bore(s) can be repaired by one of two methods:

- Method 1:—Over boring and using oversize pistons and rings.
- Method 2:—Boring and installing a repair sleeve to return the bore to standard dimensions.

METHOD 1—OVERSIZE BORE

Cylinder bore(s) can be repaired by one of two methods:

Oversize pistons and rings are available in two sizes - 0.50 mm (0.0197 inch) and 1.00 mm (0.0393 inch).

Any combination of standard, 0.50 mm (0.0197 inch) or 1.00 mm (0.0393 inch) overbore may be used in the same engine.

If more than 1.00 mm (0.0393 inch) overbore is needed, a repair sleeve can be installed (refer to Method 2—Repair Sleeve).

Cylinder block bores may be bored twice before use of a repair sleeve is required. The first bore is 0.50 mm (0.0197 inch) oversize. The second bore is 1.00 mm (0.0393 inch) oversize.

After boring to size, use a honing stone to chamfer the edge of the bore.

CYLINDER BORE DIMENSION CHART

DESCRIPTION	MEASUREMENT
BORING DIAMETER DIMENSION	1st. REBORE - 102.469 mm (4.0342 in.)
	2nd. REBORE - 102.969 mm (4.0539 in.)
HONING DIAMETER DIMENSIONS	STANDARD - 102.020 ± 0.020 mm (4.0165 ± 0.0008 in.)
	1st. REBORE - 102.520 ± 0.020 mm (4.0362 ± 0.0008 in.)
	2nd. REBORE - 103.020 ± 0.020 mm 4.0559 ± 0.0008 in.)
CHAMFER DIMENSIONS	Approx. 1.25 mm (0.049 in.) by 30°

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block (Fig. 48). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

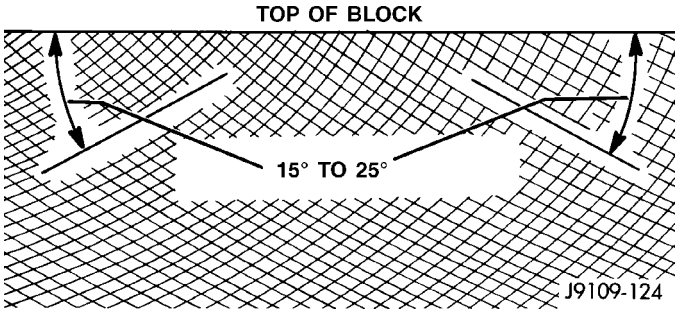

Fig. 48 Crosshatch Pattern of Repaired Sleeve(s)

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

ENGINE BLOCK (Continued)

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry.

Check the bore cleanliness by wiping with a white, lint-free, lightly- oiled cloth. There should be no grit residue present.

If the block is not to be used right away, coat it with a rust- preventing compound.

METHOD 2—REPAIR SLEEVE

If more than a 1.00 mm (0.03937 inch) diameter oversize bore is required, the block must be bored and a repair sleeve installed.

Bore the block cylinder bore to 104.500-104.515 mm (4.1142-4.1148 inch) - (Fig. 49).

Repair sleeves can be replaced by using a boring bar to bore out the old sleeve. DO NOT cut the cylinder bore beyond the oversize limit.

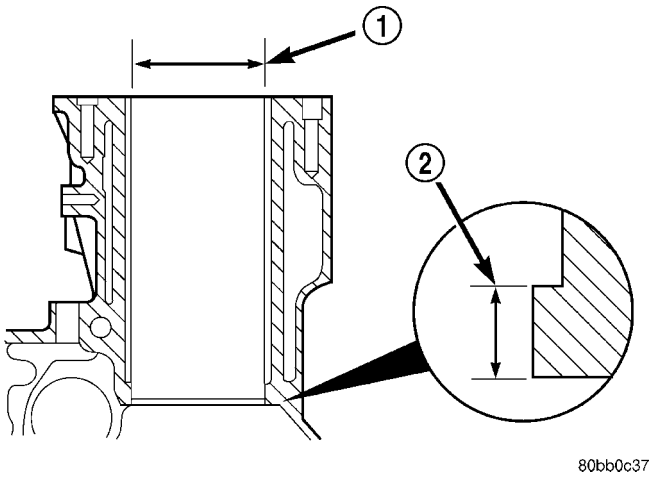

Fig. 49 Block Bore for Repair Sleeve Dimensions

1 - BORE DIAMETER
2 - STEP DIMENSION

REPAIR SLEEVE BLOCK REBORE DIMENSIONS CHART

BORE DIAMETER	STEP DIMENSION
104.500 + 0.015 mm (4.1142 + 0.0006 in.)	6.35 mm (0.25 in.)

After machining the block for the new repair sleeve, thoroughly clean the bore of all metal chips, debris and oil residue before installing the sleeve.

Cool the repair sleeve(s) to a temperature of -12°C (10°F) or below for a minimum of one hour. Be ready to install the sleeve immediately after removing it from the freezer.

Apply a coat of Loctite 620, or equivalent to the bore that is to be sleeved.

Wear protective gloves to push the cold sleeve into the bore as far as possible.

Using a sleeve driver, drive the sleeve downward until it contacts the step at the bottom of the bore (Fig. 50).

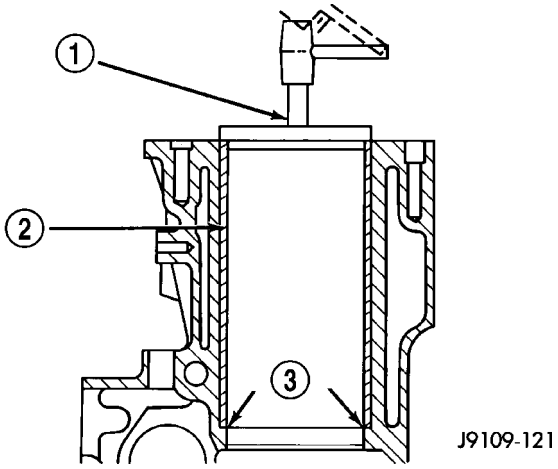

Fig. 50 Sleeve Installation

1 - SLEEVE DRIVER
2 - SLEEVE
3 - CONTACT

A sleeve driver can be constructed as follows (Fig. 51).

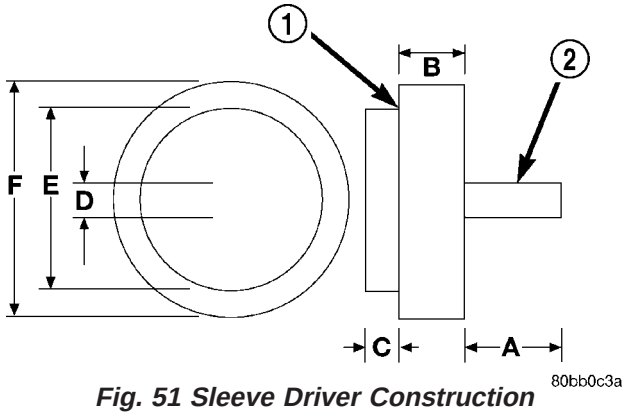

Fig. 51 Sleeve Driver Construction

1 - DRIVE
2 - HANDLE

SLEEVE DRIVER CONSTRUCTION SPECIFICATION CHART

ITEM	MEASUREMENT
A	127 mm (5 in.)
B	38 mm (1.5 in.)
C	6.35 mm (0.25 in.)
D	25.4 mm (1 in.)
E	101 mm (3.976 in.)
F	107.343 mm (4.226 in.)

Set up a boring bar and machine the sleeve to 101.956 mm (4.014 inch).

ENGINE BLOCK (Continued)

After removing the boring bar, use a honing stone to chamfer the corner of the repair sleeve(s).

SLEEVE MACHINING DIMENSIONS CHART

ITEM	MEASUREMENT
SLEEVE PROTRUSION	MIN. - FLUSH WITH BLOCK
	MAX. - 0.050 mm (0.0019 in.)
SLEEVE DIAMETER	101.956 mm (4.014 in.)
SLEEVE CHAMFER	APPROX. 1.25 mm (0.049 in.) by 15°

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block. For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

Finished bore inside dimension is 102.020 ±0.020 mm (4.0165 ±0.0008 inch).

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry with compressed air.

Wipe the bore with a white, lint-free, lightly oiled cloth. Make sure there is no grit residue present.

Apply a rust-preventing compound if the block will not be used immediately.

A standard diameter piston and a piston ring set must be used with a sleeved cylinder bore.

STANDARD PROCEDURE—CAM BORE REPAIR

For standard bushings, not oversized, maximum front and rear cam bushing bore diameter is 59.248 mm. (2.3326 in.). DO NOT bore the intermediate cam bore to the front cam bore oversize dimensions. Maximum front and rear camshaft bushing installed diameter is 54.147 mm. (2.1318 in.). Minimum installed diameter is 54.083 mm. (2.1293 in.). Maximum intermediate camshaft bore diameter is 54.164 mm. (2.1324 in.).

A surface finish of 2.3 micrometers (92 microinch) must be maintained. Not more than 20% of an area of any one bore may be 3.2 micrometers (126 microinch).

Camshaft bores can be repaired individually. It is not necessary to repair undamaged cam bores in order to repair individually damaged cam bores. The standard front bushing cannot be used to repair intermediate bores.

Install all cam bushings flush or below the front and rear cam bore surface. The front camshaft bushing should be installed flush with front face of block. The rear camshaft bushing should be installed flush with rear face of block. The oil hole must align to allow a 3.2 mm (0.125 inch) rod to pass through freely (Fig. 52).

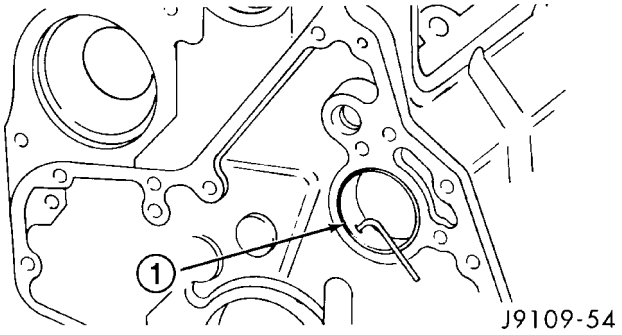

Fig. 52 Oil Hole Alignment

1 - CAMSHAFT BUSHING

INSPECTION

Measure the combustion deck face using a straight edge and a feeler gauge (Fig. 53). Cylinder block flatness: End-to-end 0.076 mm (.003 in.). Maximum variation side-to-side 0.051 mm (.002 in.).

Inspect for any localized dips or imperfections.

If the surface exceeds the limit, (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).

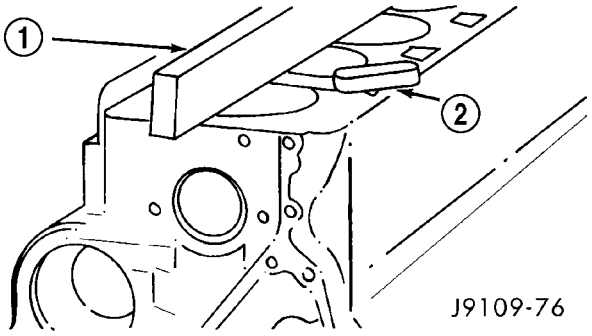

Fig. 53 Combustion Deck Face Measurement

1 - STRAIGHT EDGE
2 - FEELER GAUGE

ENGINE BLOCK (Continued)

Inspect the cylinder bores for damage or excessive wear.

Measure the cylinder bores (Fig. 54). If the cylinder bores exceed the limit, (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).

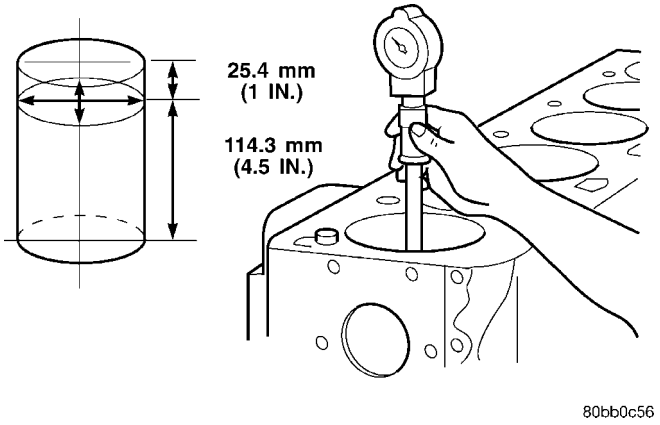

Fig. 54 Cylinder Bore Diameter

BORE SPECIFICATIONS

BORE DIAMETER	
Min.	102.000 mm (4.0157 in.)
Max.	102.116 mm (4.0203 in.)
OUT OF ROUNDNESS	
Max.	0.038 mm (0.0015 in.)
TAPER	
Max.	0.076 mm (.003 in.)

Inspect the camshaft bores for scoring or excessive wear.

Measure the camshaft bores (Refer to 9 - ENGINE - SPECIFICATIONS).

If a bore exceeds the limit, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - STANDARD PROCEDURE).

Inspect the tappet bores for scoring or excessive wear.

Measure tappet bore from bottom of block. Minimum tappet bore diameter 16.000 mm (0.0630 in.). Maximum tappet bore 16.055 mm. (0.632 in.).

If out of limits, replace the cylinder block.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL

REMOVAL—CAMSHAFT BEARINGS

NOTE: Measure the diameter of each bore. If the camshaft bore for the first or rear cam bushing is worn beyond the limit, install a new service bushing. Inspect the rest of the camshaft bores for damage or excessive wear.If the bores without a bushing are worn beyond the limit, the engine must be removed for machining and installation of service bushings. If badly worn, replace the cylinder block.

(1) Remove the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(2) Remove the bushing from the No.1 bore and No.7 using a universal cam bushing tool.

(3) Mark the cylinder block so you can align the oil hole in the cylinder block with the oil hole in the bushing.

REMOVAL - CAMSHAFT

(1) Disconnect both battery negative cables.

(2) Recover A/C refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(3) Raise vehicle on hoist.

(4) Drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Lower vehicle.

(6) Remove radiator upper hose.

(7) Remove viscous fan/drive assembly and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(8) Disconnect the coolant recovery bottle hose from the radiator filler neck.

(9) Disconnect lower radiator hose from radiator outlet.

(10) **Automatic Transmission models:** Disconnect transmission oil cooler lines from front of radiator using Special Tool 6931 (unless equipped with finger-release disconnect).

(11) Remove radiator mounting screws and lift radiator out of engine compartment.

(12) Remove upper radiator support panel.

(13) If A/C equipped, disconnect A/C condenser refrigerant lines.

(14) Disconnect charge air cooler piping from the cooler inlet and outlet.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(15) Remove the two charge air cooler mounting bolts.

(16) Remove charge air cooler (and A/C condenser if equipped) from vehicle.

(17) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(18) Remove accessory drive belt tensioner.

(19) Remove the fan support/hub assembly.

(20) Remove crankshaft damper and speed indicator ring (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(21) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the sealing surfaces. Remove dust seal with cover.

(22) Using Special Tool 7471–B Crankshaft Barring Tool, rotate the crankshaft to align the timing marks on the crankshaft and the camshaft gears.

(23) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(24) Remove the rocker arms, cross heads, and push rods (Fig. 55). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder intake and the #6 cylinder intake and exhaust pushrods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

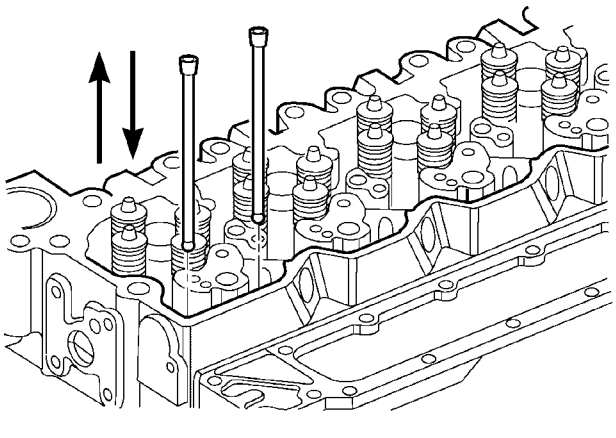

Fig. 55 Push Rod Removal/Installation

(25) Raise the tappets as follows, using the wooden dowel rods (Fig. 57)provided with the Miller Tool Kit 8502.

(a) Insert the slotted end of the dowel rod into the tappet. **The dowel rods for the rear two cylinders will have to be cut for cowl panel clearance.** Press firmly to ensure that it is seated in the tappet.

(b) Raise the dowel rod to bring the tappet to the top of its travel, and wrap a rubber band around the dowel rods (Fig. 57) to prevent the tappets from dropping into the crankcase.

(c) Repeat this procedure for the remaining cylinders.

(26) Verify that the camshaft timing marks are aligned with the crankshaft mark (Fig. 56).

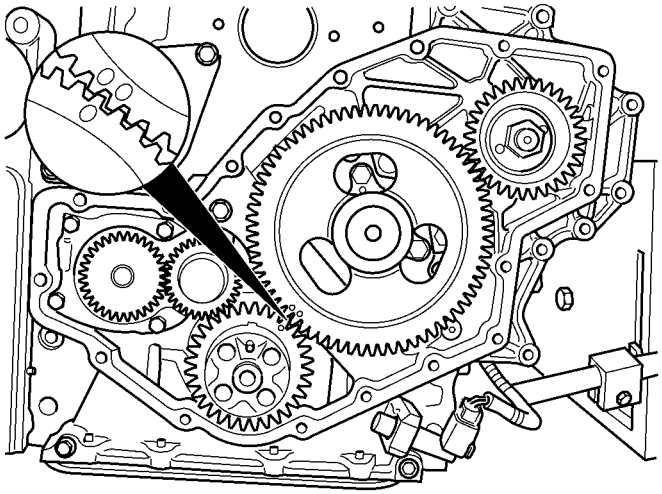

Fig. 56 Timing Mark Alignment

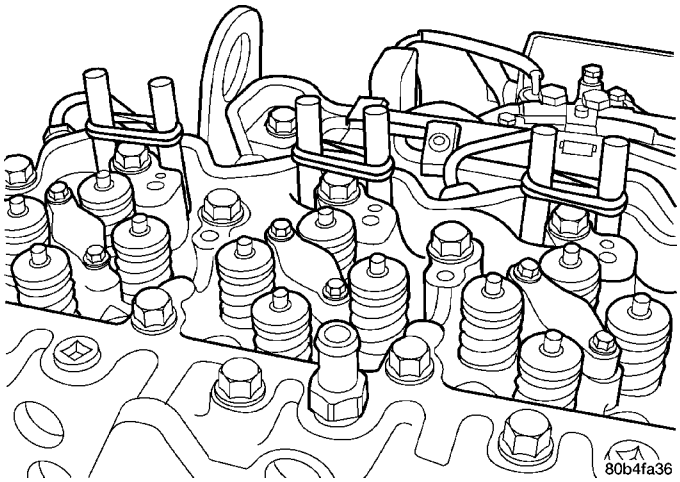

Fig. 57 Use Wooden Dowel Rods to Secure Tappets in Place - Typical

(27) Remove the bolts from the thrust plate.

(28) Remove engine mount through bolts.

(29) Install engine support fixture special tool # 8534, **and steel bracket/wing nut special tool # 8534A**.

(30) Raise engine enough to allow camshaft removal.

(31) Remove the camshaft, gear and thrust plate.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

INSPECTION

Camshaft

(1) Inspect the valve lobes and bearing journals for cracks, pitting, scoring, or generally excessive wear. Replace any camshaft that exceeds the allowable limits.

(2) Measure the bearing journals and lobes (Fig. 58).

CAUTION: If Camshaft lobes are worn, requiring camshaft replacement, it is necessary to replace the tappets also. (Refer to 9 - ENGINE/ENGINE BLOCK/ SOLID LIFTERS - REMOVAL).

CAMSHAFT DIMENSIONS

CAMSHAFT DIMENSIONS	
Journal diameter (No.1 and No.7)	
Min.	54.028 mm. (2.127 in.)
Max.	54.048 mm. (2.128 in.)
Journal diameter (No.2 through No.6)	
Min.	53.962 mm. (2.1245 in.)
Max.	54.013 mm. (2.1265 in.)
Diameter of peak of lobe	
Intake	
Min.	47.175 mm (1.857 in.)
Max	47.855 mm.
Exhaust	
Min.	45.632 mm. (1.797 in.)
Max.	46.312 mm. (1.823 in.)

Camshaft Bushing/Bores

Camshaft bores No. 2–6 **do not** use a bushing.

(1) Inspect the camshaft bushing and bores for signs of excessive wear.

(2) Measure the camshaft bushing and bores (Fig. 59) with a telescoping bore gauge and micrometer. If out of specification, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

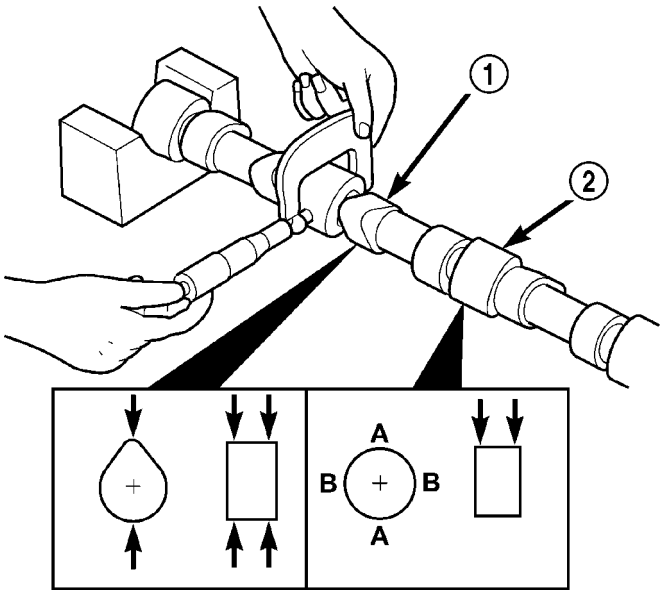

Fig. 58 Measuring

1 - VALVE LOBE
2 - CAMSHAFT JOURNAL

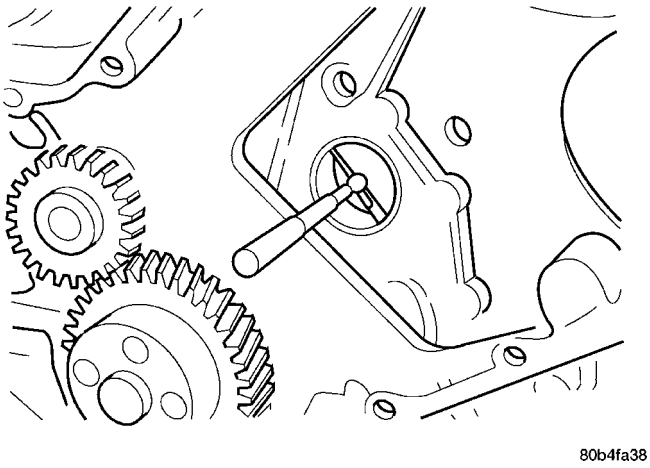

Fig. 59 Measuring Camshaft Bushing and Bores

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(3) Inspect the camshaft bushing oil holes for alignment with cylinder block (Fig. 60).

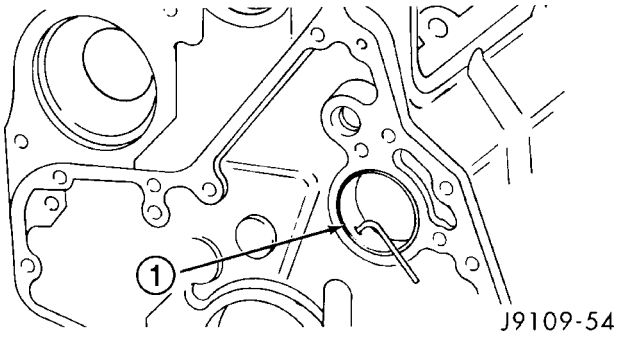

Fig. 60 Inspecting Oil Hole Alignment

1 - CAMSHAFT BUSHING

Camshaft Gear

Inspect the camshaft gear for cracks (gear and hub), and chipped/broken/fretted teeth. If replacement is necessary, camshaft and gear are replaced as an assembly. (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

Thrust Plate

Inspect the camshaft thrust plate for excessive wear in the camshaft contact area. Measure thrust plate thickness using the CAMSHAFT THRUST PLATE THICKNESS CHART. Replace any thrust plate that falls outside of these specifications:

CAMSHAFT THRUST PLATE THICKNESS CHART

MIN. 9.34 mm (0.368 in.)
MAX. 9.60 mm (0.378 in.)

INSTALLATION

INSTALLATION - CAMSHAFT BEARINGS

(1) Apply a coating of Loctite® 640 Adhesive to the backside of the new bushing. Avoid getting adhesive in the oil hole.

(2) Use a universal cam bushing installation tool and install the front bushing so that it is even with the front face of the cylinder block. The oil hole must be aligned. A 3.2 mm (0.128 inch) diameter rod must be able to pass through the hole. (Fig. 61).

(3) Install the rear camshaft bushing is flush with the rear face of the block. The oil hole must be aligned. A 3.2 mm (0.128 inch) diameter rod must be able to pass through the hole.

(4) Measure the installed bushings at the front and rear bores. The minimum inside diameter is 54.083 mm (2.1293 inch), and the maximum inside diameter is is 54.147 mm. (2.1318 in.).

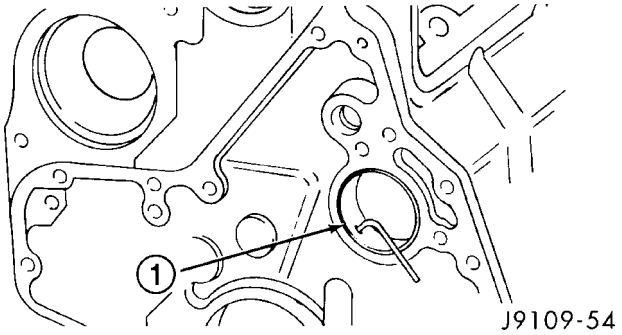

Fig. 61 Oil Hole Alignment

1 - CAMSHAFT BUSHING

INSTALLATION - CAMSHAFT

(1) Lubricate the camshaft bushing and bores with fresh engine oil or suitable equivalent.

(2) Liberally coat the camshaft lobes, journals, and thrust washer with fresh engine oil or suitable equivalent.

CAUTION: When installing the camshaft, DO NOT push it in farther than it will go with the thrust washer in place.

(3) Install the camshaft and thrust plate. Align the timing marks as shown (Fig. 62).

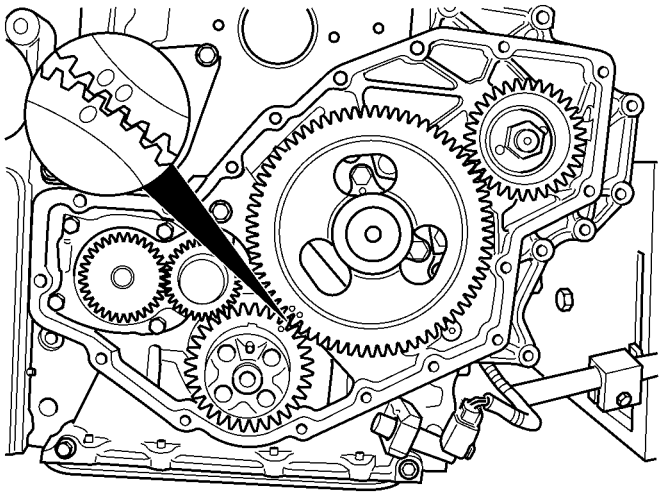

Fig. 62 Timing Mark Alignment

(4) Install the thrust plate bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Measure camshaft back lash and end clearance.

BACKLASH — 0.075—0.250 mm (0.003—0.010 inch)
CLEARANCE — 0.025—0.500 mm (0.001—0.020 inch)

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(6) Remove the wooden dowel rods and rubber bands from the tappets.

(7) Lubricate the push rods with engine oil and install in their original location. **Verify that they are seated in the tappets.**

(8) Lubricate the valve tips with engine oil and install the crossheads in their original locations.

(9) Lubricate the crossheads and push rod sockets with engine oil and install the rocker arms and pedestals in their original locations. Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(10) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(11) Install the cylinder head cover and reusable gasket (Refer to 9 - ENGINE/CYLINDER HEAD/ CYLINDER HEAD COVER(S) - INSTALLATION).

(12) Install gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - INSTALLATION). Install front crankshaft dust seal.

(13) Install the crankshaft damper with the speed indicator ring (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(14) Install the fan support/hub assembly Refer to (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(15) Install the power steering pump.

(16) Install accessory drive belt tensioner. Torque bolt to 43 Nm (32 ft. lbs.).

(17) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(18) Install the charge air cooler (with a/c condenser and auxiliary transmission oil cooler, if equipped) and tighten the mounting bolts to 2 N·m (17 in. lbs.) torque.

(19) Connect charge air cooler inlet and outlet pipes. Tighten clamps to 11 N·m (95 in. lbs.) torque.

(20) Install the radiator upper support panel.

(21) Close radiator petcock and lower the radiator into the engine compartment. Tighten the mounting bolts to 11 N·m (95 in. lbs.) torque.

(22) Raise vehicle on hoist.

(23) Connect radiator lower hose and install clamp.

(24) Connect transmission auxiliary oil cooler lines (if equipped).

(25) Lower vehicle.

(26) Install the fan shroud and tighten the mounting screws to 6 N·m (50 in. lbs.) torque.

(27) Install the electronically controlled viscous fan/drive assembly. Connect harness connector.(Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(28) Install the coolant recovery and windshield washer fluid reservoirs to the fan shroud.

(29) Connect the coolant recovery hose to the radiator filler neck.

(30) Add engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(31) Charge A/C system with refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(32) Connect the battery negative cables.

(33) Start engine and check for engine oil and coolant leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING ROD BEARING AND CRANKSHAFT JOURNAL CLEARANCE

(1) Measure the connecting rod bore with bearings **removed** and the bolts tightened to 100 N·m (73 ft. lbs.) torque..

(2) Measure the connecting rod bore with the bearings **installed** and the bolts tightened to 100 N·m (73 ft. lbs.) torque.

Measure within 20° arc from each side of the parting line. Also measure 90° from parting line.

Record the smallest and largest diameter.

Measure the diameter of the rod journal at the location shown (Fig. 63). Calculate the average diameter for each side of the journal.

Determine minimum bearing clearance by calculating the differance between the smallest connecting rod bore diameter with the bearing installed and the average diameter for each side of the crankshaft journal.

Determine the maximum bearing clearance by calculating the difference between the largest connecting rod bore diameter and the average diameter with the bearing installed for each side of the crankshaft journal.

DESCRIPTION	MEASUREMENT
CONNECTING ROD BORE, BEARINGS REMOVED	MIN. 72.99 mm (2.874 in.) MAX. 73.01 mm (2.875 in.)
CONNECTING ROD BORE, BEARINGS INSTALLED	MIN. 69.05 mm (2.719 in.) MAX. 69.10 mm (2.720 in.)

CONNECTING ROD BEARINGS (Continued)

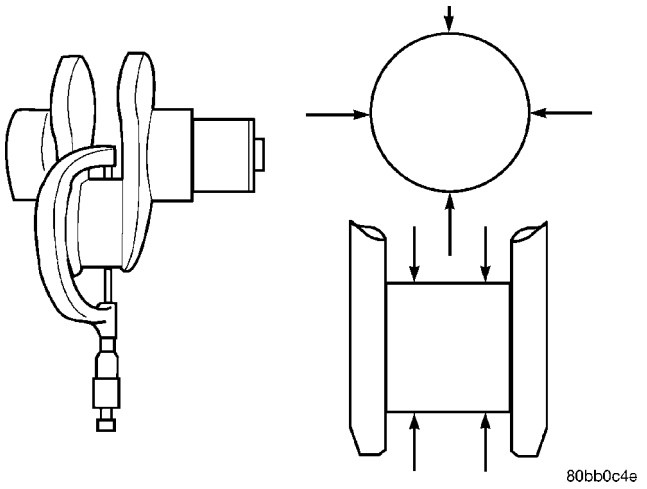

Fig. 63 Connecting Rod Journal Diameter Limits

CONNECTING ROD JOURNAL DIAMETER LIMITS CHART

DESCRIPTION	MEASUREMENT
CRANKSHAFT ROD JOURNAL DIAMETER	Min. 68.96 mm (2.715 in.) Max. 69.01 mm (2.717 in.)
BEARING CLEARANCE	Min. 0.04 mm (.002 in.) Max. 0.12 mm (0.005 in.)

If the crankshaft is within limits, replace the bearing. If the crankshaft is out of limits, grind the crankshaft to the next smaller size and use oversize rod bearings.

CRANKSHAFT AND GEAR

DESCRIPTION

The crankshaft (Fig. 64) is a forged steel, integrally balanced unit. It is supported by seven main bearings, with position number six designated as the thrust journal. The crankshaft is held in place by main caps and 12 mm capscrews. The crankshaft also has internal cross drillings to supply the connecting rods with engine oil.

REMOVAL - GEAR

(1) Remove the gear housing cover. (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - REMOVAL)

(2) Split the gear and remove it from the crankshaft.

INSTALLATION - GEAR

(1) Remove all burrs and make sure the gear surface on the end of the crankshaft is smooth.

(2) If removed, install a new alignment pin. Drive the pin in using a ball- peen hammer, leaving it protruding 1.0 mm (0.039 inch) to 1.5 mm (0.059 inch) above the crankshaft (Fig. 65).

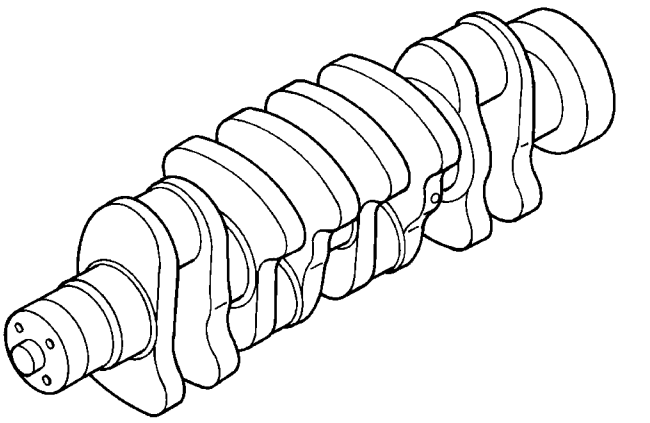

Fig. 64 Crankshaft

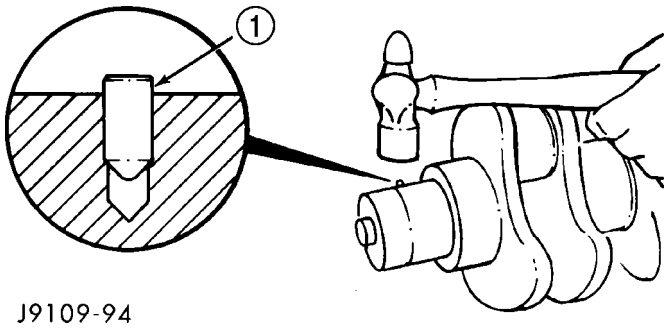

Fig. 65 Installing Alignment Pin

1 - ALIGNMENT PIN

WARNING: WEAR PROTECTIVE GLOVES TO PREVENT INJURY.

CAUTION: DO NOT heat the gear longer than 45 minutes.

(3) Heat the crankshaft gear for 45 minutes at a temperature of 149°C (300°F). **Do not use torch, gear failure will occur.**

(4) Apply a thin coat of lubricant to the nose of the crankshaft.

(5) Position the gear with the timing mark out and install it on the crankshaft using the alignment pin. Make sure the gear contacts the shoulder.

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - MAIN BEARING CLEARANCE

Inspect the main bearing bores for damage or abnormal wear.

(1) Remove bearings and measure main bearing bore diameter after torquing main bearing cap bolts to 176 Nm (130 ft. lbs.).

(2) Install the crankshaft main bearings and measure main bearing bore diameter with the main bolts tightened to 176 N·m (130 ft. lbs.) torque (Fig. 66).

(3) Measure the diameter of the main journal at the locations shown (Fig. 67). Calculate the average diameter for each side of the journal.

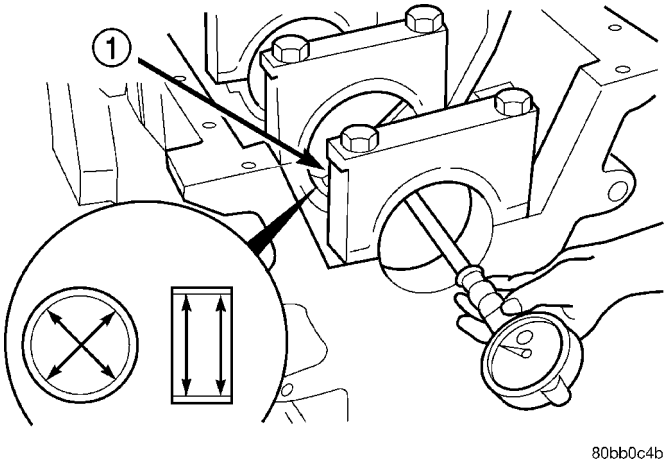

Fig. 66 Crankshaft Main Bearing Bore Diameter

1 - MAIN BEARING CAPS

MAIN BEARING BORE DIAMETER CHART

ITEM	MAIN BEARING BORE DIAMETER (MAXIMUM)
BEARINGS INSTALLED	83.106 mm (3.2719 in.)
BEARINGS REMOVED	Min 87.983 mm (3.4639 in.) Max. 88.019 mm (3.4653 in.)

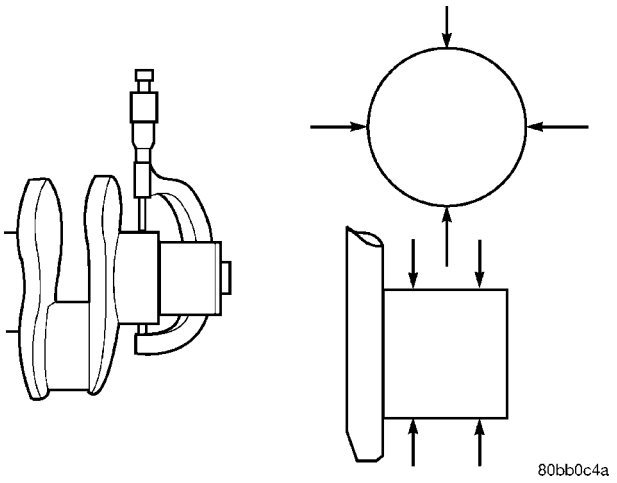

Fig. 67 Crankshaft Main Journal Diameter

CRANKSHAFT MAIN JOURNAL DIAMETER CHART

ITEM	SPECIFICATION
Minimum diameter	82.962 mm (3.2662 in.)
Maximum diameter	83.013 mm (3.2682 in.)
Maximum out of roundness	0.050 mm (.002 in.)
Maximum taper	0.013 mm (.0005 in.)
Thrust distance (at No.6 position)	Min. 0.065 mm (.003 in.) Max. 0.432 mm (.017 in.)

(4) Calculate the main bearing journal to bearing clearance. Maximum clearance is 0.119 mm (0.00475 inch). If the crankshaft journal is within limits, replace the main bearings. If not within specifications, grind the crankshaft to next size and use oversize bearings.

(5) Measure thrust distance at the No.6 position.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect both battery negative cables.
(2) Raise vehicle on hoist.
(3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).
(4) Lower vehicle.
(5) Remove radiator upper hose.
(6) Disconnect coolant recovery bottle from radiator filler neck and lift bottle off of fan shroud.
(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.
(8) Remove the fan shroud-to-radiator mounting bolts.
(9) Remove viscous fan/drive assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(10) Remove cooling fan shroud and fan assembly from the vehicle.
(11) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(12) Remove the cooling fan support/hub from the front of the engine.
(13) Raise the vehicle on hoist.
(14) Remove the crankshaft damper and speed indicator ring.
(15) Remove power steering pump.
(16) Remove accessory drive belt tensioner.
(17) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces. Remove crank seal dust shield with cover.
(18) Support the cover on a flat work surface with wooden blocks (Fig. 68), and using a suitable punch and hammer, drive the old seal out of the cover from the back side of the cover to the front side (Fig. 68).

INSTALLATION

(1) Clean cover and housing gasket mating surfaces. Use a suitable scraper and be careful not to damage the gear housing surface. Remove any old sealer from the oil seal bore. Thoroughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.
(2) Inspect the gear housing and cover for cracks and replace if necessary. Carefully straighten any bends or imperfections in the gear cover with a ball-peen hammer on a flat surface. Inspect the crankshaft front journal for any grooves or nicks that would affect the integrity of the new seal.
(3) Apply a bead of Mopar® Stud & Bearing Mount to the outside diameter of the seal. Do not lubricate the inside diameter of the new seal.

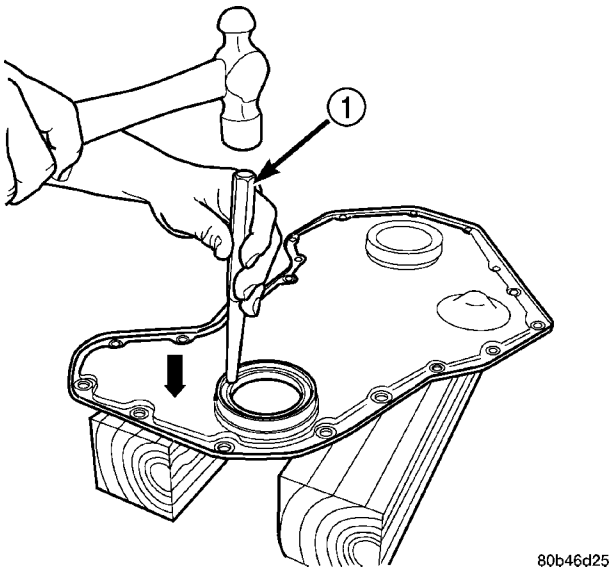

Fig. 68 Removing Seal from Cover

1 - PUNCH

(4) With the cover supported by wood blocks, install the seal into the rear of the cover using crankshaft seal installer Special Tool 8281 and driver handle C-4171 (Fig. 69). Strike the driver handle until the installation tool bottoms out on the inside of the cover.

CAUTION: Do not distort or damage seal.

(5) Install the plastic seal pilot (provided with seal kit) into the crankshaft seal.

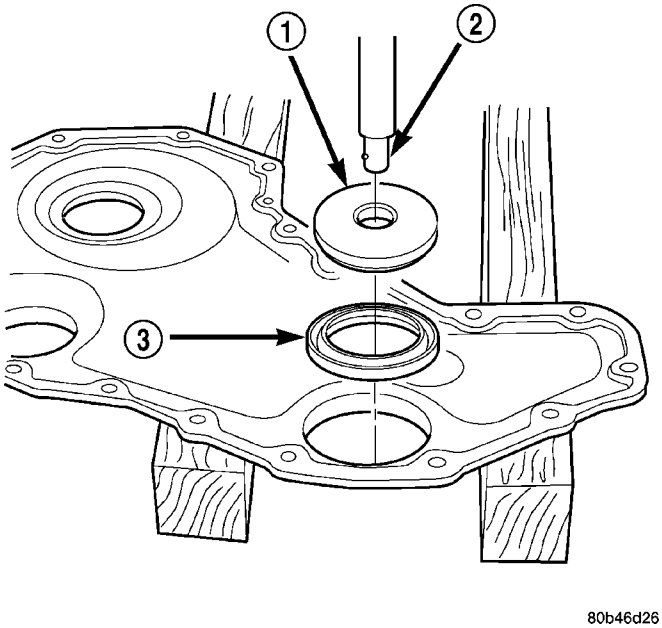

Fig. 69 Installing Seal Into Cover With Tool 8281

1 - SEAL INSTALLER 8281
2 - DRIVER HANDLE C4171
3 - SEAL

CRANKSHAFT OIL SEAL - FRONT (Continued)

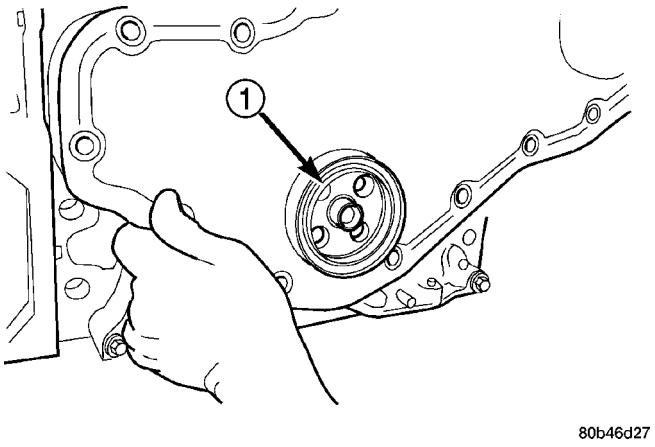

Fig. 70 Installing Front Cover with Seal Pilot

1 - SEAL PILOT

(6) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

(7) Install the cover to the gear housing, aligning the seal pilot with the nose of the crankshaft (Fig. 70).

(8) Install the cover bolts and tighten to 24 N·m (18 ft. lbs.) torque. Remove pilot tool.

(9) Install dust shield over nose of crankshaft.

(10) Install the crankshaft damper and speed indicator ring. Torque the bolts to 40 N·m (30 ft. lbs.). Then rotate an additional 60°. Use the engine barring tool to keep the engine from rotating during tightening operation.

(11) Install the fan support/hub assembly and torque bolts to 32 N·m (24 ft. lbs.).

(12) Install power steering pump.

(13) Install accessory drive belt tensioner. Torque bolt to 43 Nm (32 ft.lbs.).

(14) Install cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(15) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(16) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(17) Connect battery negative cables.

(18) Start engine and check for oil leaks.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the transmission and transfer case (if equipped).

(3) Remove the clutch cover and disc (if manual transmission equipped) (Refer to 6 - CLUTCH/CLUTCH DISC - REMOVAL).

(4) Remove the flywheel or converter drive plate.

(5) Drill holes 180° apart into the seal. Be careful not to contact the drill against the crankshaft.

(6) Install #10 sheet metal screws in the drilled holes and remove the rear seal with a slide hammer (Fig. 71).

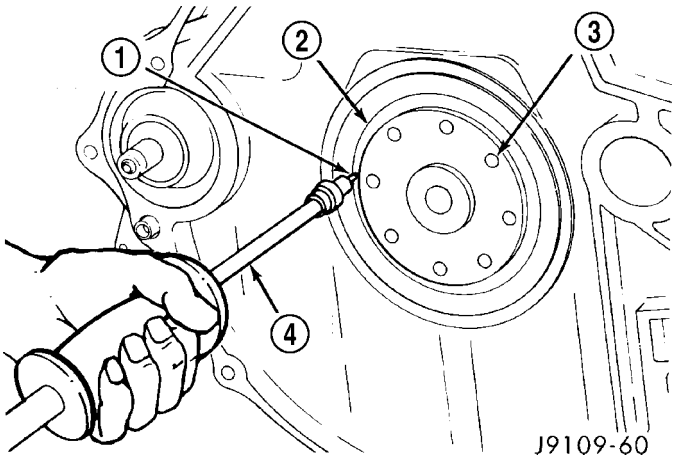

Fig. 71 Crankshaft Rear Seal Removal

1 - NO. 10 SCREW
2 - REAR SEAL
3 - CRANKSHAFT
4 - SLIDE HAMMER

INSTALLATION

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal surfaces must be completely dry when the seal is installed. Use a soap and water solution on outside diameter of seal to ease assembly.

(1) Clean the crankshaft journal with a suitable solvent and dry with a clean shop towel or compressed air. Wipe the inside bore of the crankshaft seal retainer with a clean shop towel.

(2) Inspect the crankshaft journal for gouges, nicks, or other imperfections. If the seal groove in the crankshaft is excessively deep, install the new seal 1/8” deeper into the retainer bore, or obtain a crankshaft wear sleeve that is available in the aftermarket.

(3) Install the seal pilot and new seal, provided in the replacement kit, onto the crankshaft.

(4) Remove the seal pilot.

(5) Install the installation tool over crankshaft.

(6) Using a ball peen hammer, strike the tool at the 12, 3, 6, and 9 o’clock positions until the alignment tool bottoms out on the retainer (Fig. 72).

CRANKSHAFT OIL SEAL - REAR (Continued)

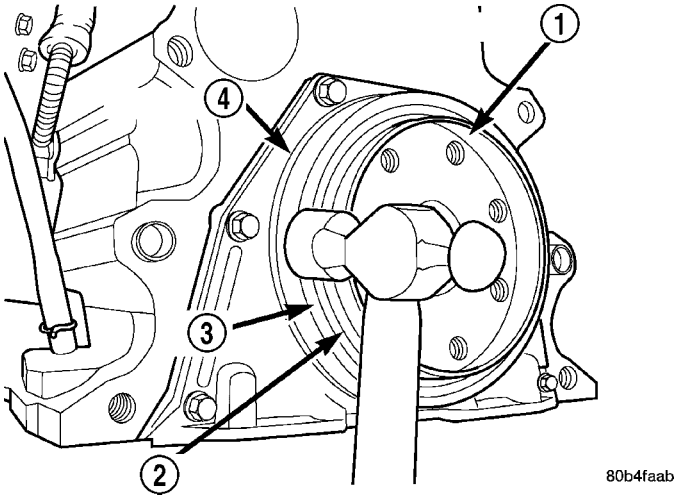

Fig. 72 Seal Installation Using Alignment Tool and Hammer

3 - SEAL
4 - RETAINER

(7) Install the flywheel or converter drive plate. Tighten the bolts to 137 N·m (101 ft. lbs.) torque.

(8) Install the clutch cover and disc (if equipped) (Refer to 6 - CLUTCH/CLUTCH DISC - INSTALLATION).

(9) Install the transmission and transfer case (if equipped).

(10) Lower vehicle.

(11) Connect battery negative cables.

(12) Check engine oil level and adjust, if necessary.

(13) Start engine and check for oil leaks.

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove the oil pan drain plug and drain the engine oil. Re-install plug and torque to 50 N·m (44 ft. lbs.) torque.

(4) Remove transmission and transfer case (if equipped) from vehicle.

(5) Remove flywheel or torque converter drive plate.

(6) Disconnect starter cables from starter motor.

(7) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL) and transmission adapter plate assembly.

(8) Remove four (4) oil pan rear bolts. Slide a feeler gauge between the seal retainer and oil pan gasket to break the seal.

(9) Remove the six (6) retainer-to-block bolts (Fig. 73).

(10) Remove the rear seal retainer and gasket (Fig. 73).

(11) Support the seal retainer and drive out the crankshaft seal with a hammer and suitable punch.

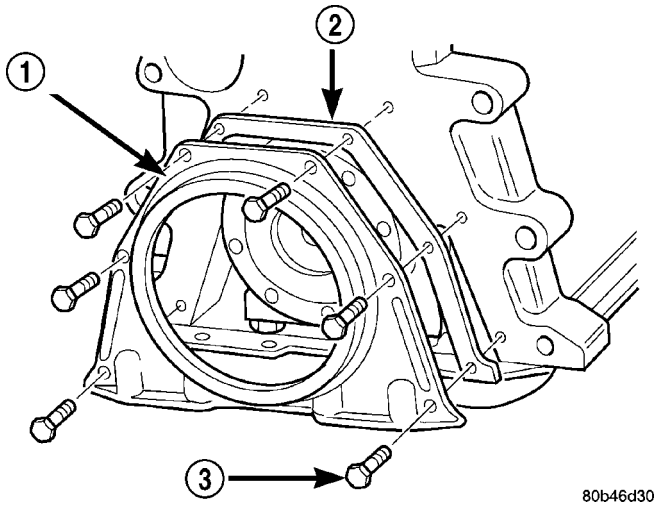

Fig. 73 Crankshaft Rear Seal Retainer and Gasket

1 - RETAINER
2 - GASKET
3 - BOLT

INSTALLATION

(1) If using the old seal retainer, the crankshaft seal must be replaced.

(2) Inspect oil pan gasket for nickes or cuts. If gasket is damaged, the oil pan must be removed and gasket must be replaced. Wipe oil pan gasket dry and apply light coating of RTV.

(3) Using the retainer alignment/seal installation tool provided in the seal service kit, install the alignment tool into the retainer and install to the cylinder block (Fig. 74), using a new gasket. Tighten the six (6) mounting bolts by hand.

(4) The seal alignment tool is used to align rear cover properly. Starting with the center two bolts, tighten the retainer in a circular pattern to 10 N·m (89 in. lbs.). Remove the alignment tool.

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal surfaces must be completely dry when the seal is installed. Use a soap and water solution on outside diameter of seal to ease assembly.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

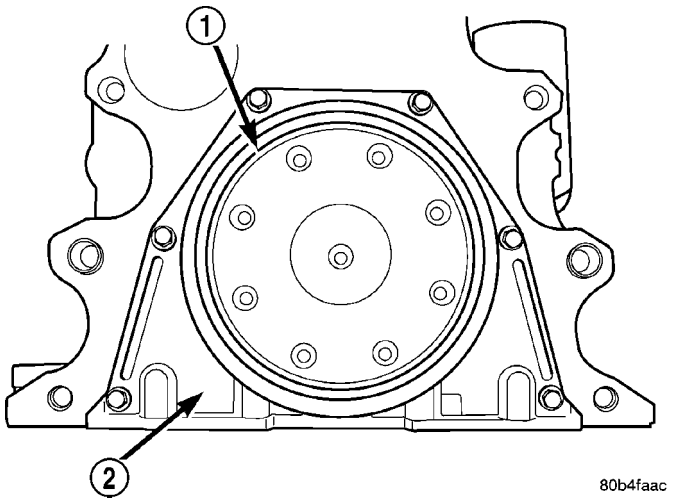

Fig. 74 Aligning Seal Retainer with Alignment/ Installation Tool

1 - ALIGNMENT / INSTALLATION TOOL
2 - SEAL RETAINER

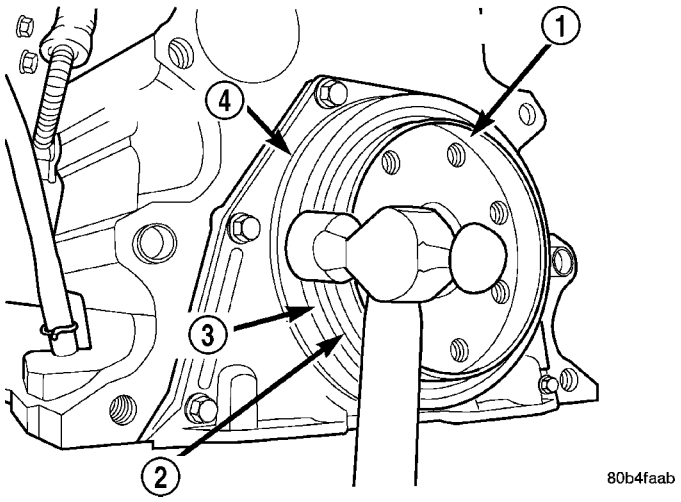

Fig. 75 Installing Seal Using Alignment Tool and Hammer

1 - SEAL PILOT TOOL
2 - INSTALLATION TOOL
3 - SEAL
4 - RETAINER

(5) Make sure the provided seal pilot is installed into the new crankshaft seal. Use the alignment/installation tool and press the seal onto the crankshaft (Fig. 75). Alternately drive the seal at the 12, 3, 6 and 9 o'clock positions.

(6) Remove the alignment tool and trim the retainer gasket even with the oil pan mounting surface (Fig. 76).

(7) Remove the seal pilot.

(8) Apply a small amount of Mopar® Silicone Rubber Adhesive Sealant to the oil pan rail T-joints.

(9) Install the four (4) oil pan rear mounting bolts and torque to 28 N·m (21 ft. lbs.).

(10) Install new rectangular ring seal for cam bore.

(11) Install the flywheel housing and bolts. Torque bolts to 77 N·m (57 ft. lbs.).

(12) Install the flywheel or converter drive plate. Tighten bolts to 137 N·m (101 ft. lbs.).

(13) Install the starter motor Refer to (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(14) Install the transmission and transfer case (if equipped).

(15) Lower vehicle.

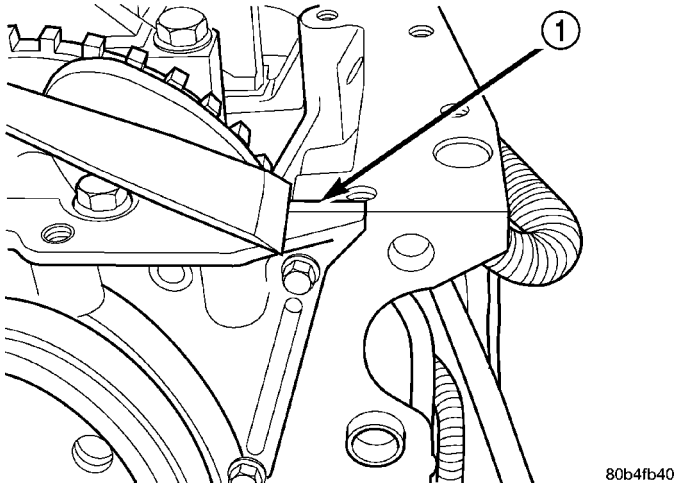

Fig. 76 Trimming Excess Gasket Material

1 - GASKET

(16) Fill the crankcase with new engine oil.

(17) Connect the battery negative cables.

(18) Start engine and check for oil leaks.

SOLID LIFTERS/TAPPETS

REMOVAL

NOTE: This procedure requires use of Miller Tool 8502 Tappet Replacement Kit.

(1) Remove camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(2) Insert the trough (provided with tool kit) the full length of the camshaft bore (Fig. 77). Make sure the cap end goes in first and the open side faces up (towards tappets).

(3) **Remove only one tappet at a time.** Remove rubber band from one cylinder pair and attach tappet dowel not being removed to the next cylinder pair (Fig. 78).

(4) Raise dowel rod (disengage from tappet) and allow tappet to fall into trough (Fig. 79).

(5) Carefully remove trough **(do not rotate)** and tappet. If the tappet is not being replaced, mark it so it can be installed in its original location.

(6) Re-install trough and repeat procedure on remaining tappets.

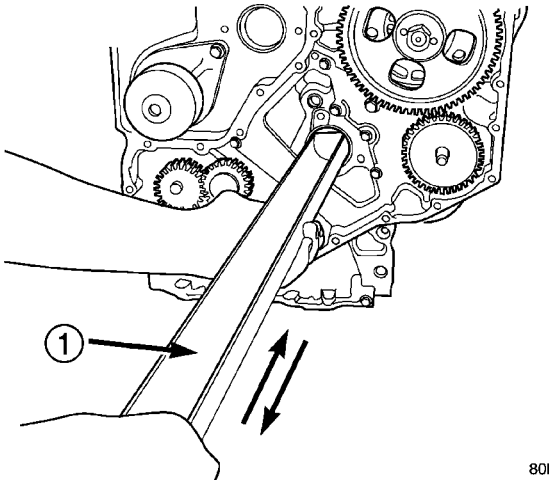

Fig. 77 Inserting the Trough - Typical

1 - TROUGH

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSPECTION

(1) Visually inspect the tappet the tappet socket, stem, and face for excessive wear, cracks, or obvious damage (Fig. 80).

(2) Measure the tappet stem diameter. Replace the tappet if it falls below the minimum size (Fig. 80).

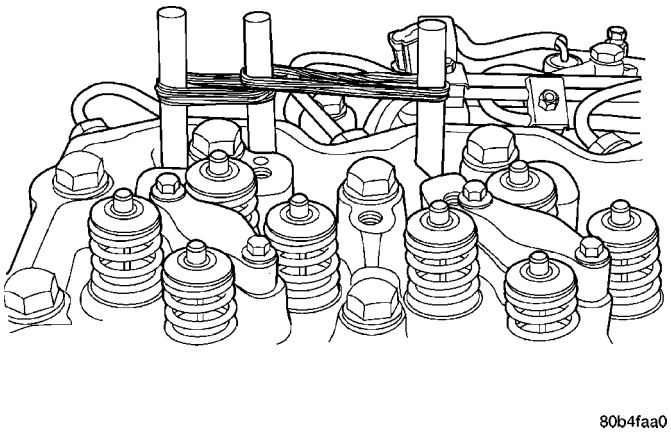

Fig. 78 Secure Dowel/Tappet to Adjacent Cylinder - typical

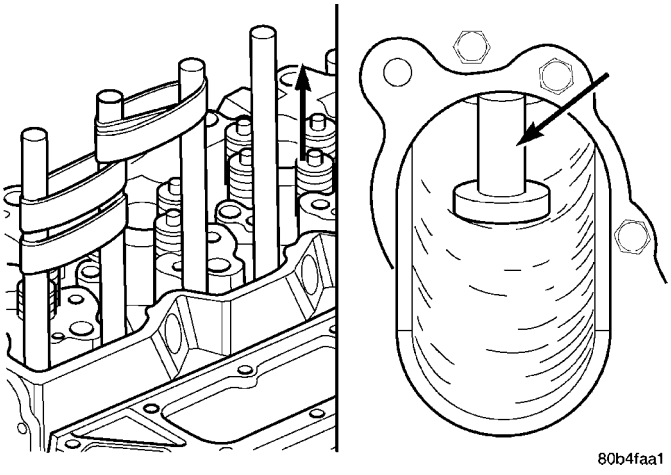

Fig. 79 Lift Dowel Rod to Disengage from Tappet - typical

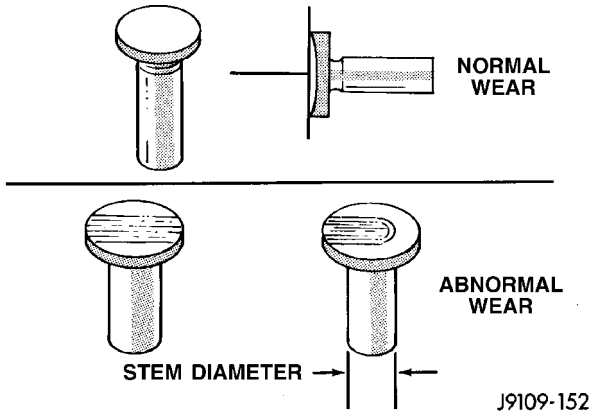

Fig. 80 Tappet Inspection

TAPPET STEM DIAMETER
15.936 mm (0.627 in.) MIN.
15.977 mm (0.629 in.) MAX.

SOLID LIFTERS/TAPPETS (Continued)

INSTALLATION

(1) Insert the trough the full length of the camshaft bore. Again, make sure the cap end goes in first and the open side faces up (towards tappets).

(2) Lower the tappet installation tool through the push rod hole (Fig. 81) and into the trough.

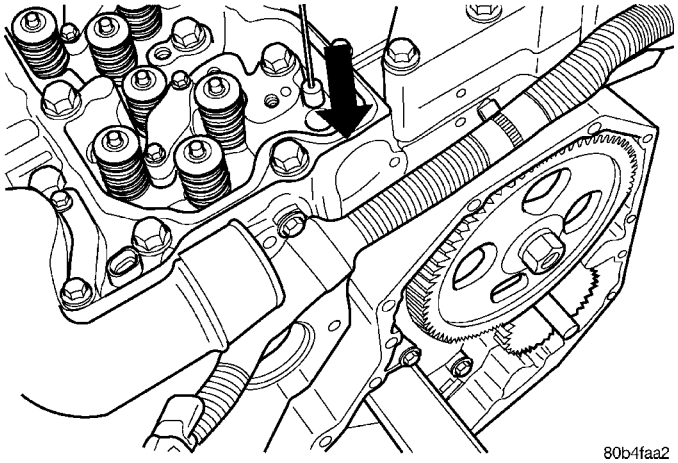

Fig. 81 Insert Installation Tool through Push Rod Hole - Typical

(3) Retrieve the tappet installation tool using the hooked rod provided with the tool kit (Fig. 82).

(4) Lubricate the tappet with clean engine oil or suitable equivalent and install the tappet to the installation tool (Fig. 83).

(5) Pull the tappet up and into position (Fig. 83). If difficulty is experienced getting the tappet to make the turn into the tappet bore, wiggle the trough while **gently** pulling up on the tappet.

(6) With the tappet in place, rotate the trough one half turn so the open side is down (toward crankshaft) (Fig. 84).

(7) Remove the tappet installation tool from the tappet.

(8) Re-install a dowel rod and secure the rod with a rubber band.

(9) Rotate the trough one half turn and repeat the procedure for the remaining tappets.

(10) Install the camshaft (Refer to 9 - ENGINE/ ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - INSTALLATION).

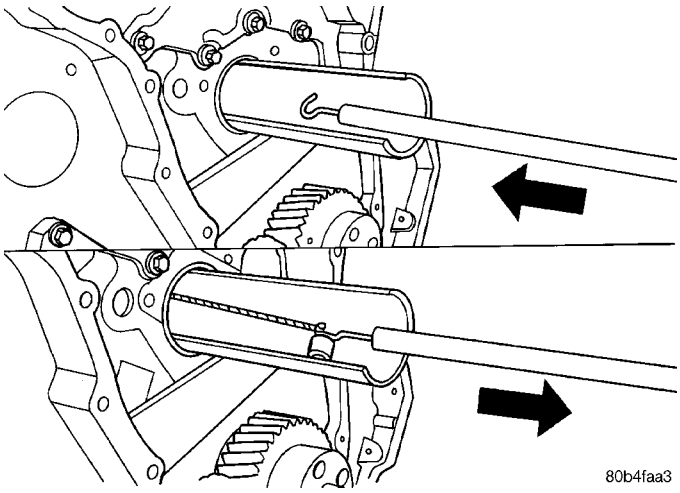

Fig. 82 Retrieve Tappet Installation Tool through Cam Bore - Typical

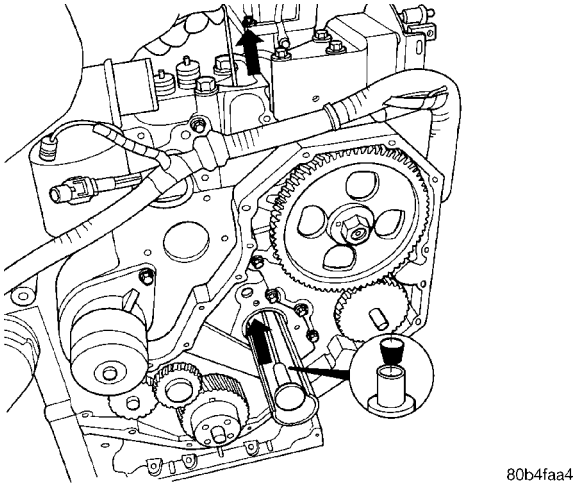

Fig. 83 Insert Tool and Pull Tappet Into Place - Typical

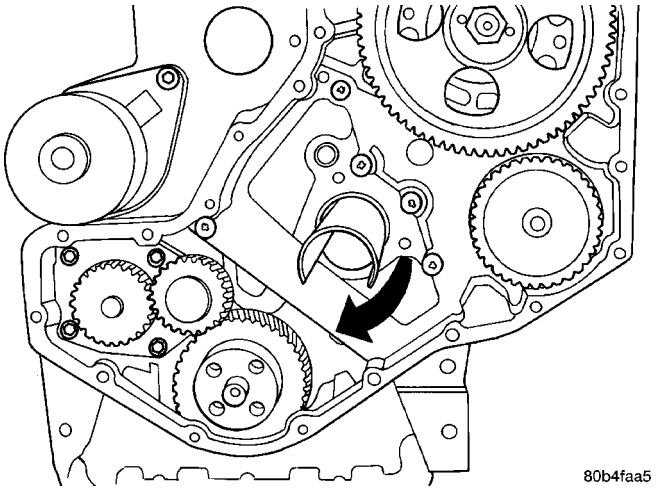

Fig. 84 Rotate Trough One Half Turn (180°) - Typical

PISTON & CONNECTING ROD

DESCRIPTION

PISTONS

The piston (Fig. 85) is constructed of aluminum and is gravity cast, free floating design. The piston incorporates a centrally located high swirl combustion bowl, and utilizes a “keystone” style top compression ring (Fig. 86), and a “Tapered Face” intermediate ring (Fig. 86), for superior cylinder wall scraping. Piston cooling nozzles cool the piston and pin with engine oil supplied by the crankshaft main journals. High horsepower pistons are gallery cooled and utilize J-jet piston cooling nozzles. Pistons are directional in order to provide clearance to piston cooling nozzles.

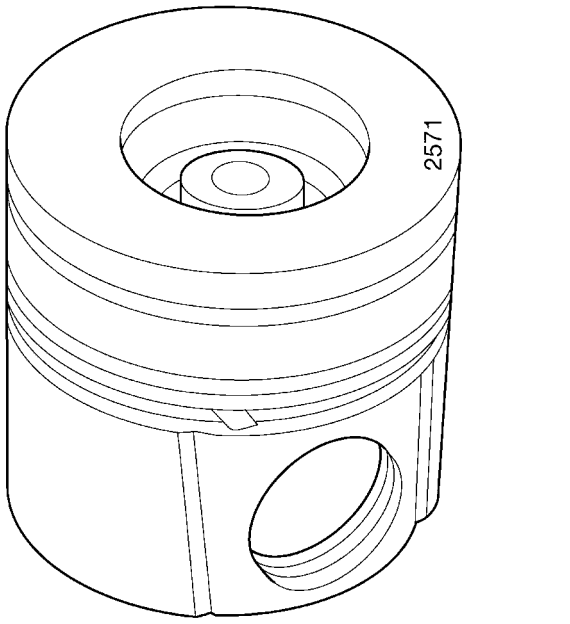

Fig. 85 Piston - Typical

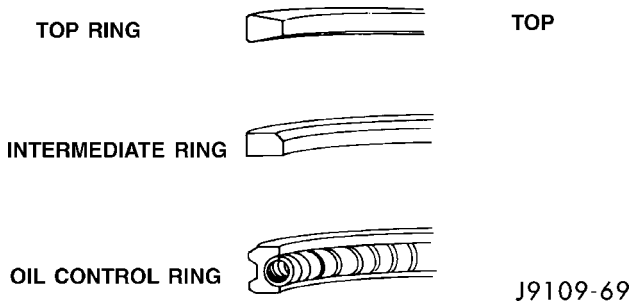

Fig. 86 Piston Ring Identification

CONNECTING RODS

The connecting rods are a split angle design. They have a pressed-in-place wrist pin bushing that is lubricated by piston cooling nozzle oil spray.

Machined connecting rods are no longer used in the diesel engine. Do not install machined connecting rods into an engine that has fractured split connecting rods.

Fractured split connecting rods are first manufactured as a single piece and then fractured into two pieces. Fractured split connecting rods can be identified by a rough and irregular surface at the connecting rod split face. To properly assemble the rod cap to the connecting rod, the bearing tangs on the connecting rod and cap must be located on the same side of the rod. The long end of the connecting rod must be assembled on the intake or camshaft side of the engine.

Each matched fractured split connecting rod and cap is an assembly and are not interchangeable. If a connecting rod or cap is damaged, the entire assembly must be replaced.

STANDARD PROCEDURE - HEAD GASKET SELECTION

(1) Measure piston protrusion for all six pistons.

(2) Calculate the average piston protrusion. Maximum allowable protrusion is 0.516 mm (0.020 inch).

NOTE: There are two different head gaskets available. One gasket is for Average piston protrusion less than 0.30 mm (0.011 inch). The other gasket is for Average piston protrusion greater than 0.30 mm (0.011 inch)

REMOVAL

(1) Disconnect the battery cables.

(2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) Remove the oil pan and suction tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove bolts and the block stiffener.

(5) Using Miller Tool 7471-B crankshaft barring tool, rotate the crankshaft so all of the pistons are below TDC.

(6) Before removing the piston(s) from the bore(s):

(a) Remove any carbon ridge formations or deposits at the top of the bore with a dull scraper or soft wire brush.

(b) If cylinder bore wear ridges are found, use a ridge reamer to cut the ridge from the bore. DO NOT remove more metal than necessary to remove the ridge.

(7) Remove the J-jet cooling nozzles, if equipped.

PISTON & CONNECTING ROD (Continued)

NOTE: If cylinders have ridges, the cylinders are oversize and will more than likely need boring.

(8) Using a hammer and steel stamp, stamp the cylinder number in the top of each piston. The front of the piston is identified by a stamping on the top of the piston. DO NOT stamp in the outside 5 mm (.197 in.) of the piston diameter. DO NOT stamp over the piston pin.

(9) Mark the connecting rod and cap with the corresponding cylinder numbers.

(10) Remove the connecting rod bolts and rod caps. Use care so the cylinder bores and connecting rods are not damaged.

(11) Use a hammer handle or similar object to push the piston and connecting rod through the cylinder bore.

(12) Store the piston/rod assemblies in a rack.

CLEANING—PISTON AND CONNECTING ROD

CAUTION: DO NOT use bead blast to clean the pistons. DO NOT clean the pistons and rods in an acid tank.

PISTON

Clean the pistons and pins in a suitable solvent, rinse in hot water and blow dry with compressed air. Soaking the pistons over night will loosen most of the carbon build up. De-carbon the ring grooves with a broken piston ring and again clean the pistons in solvent. Rinse in hot water and blow dry with compressed air.

CONNECTING ROD

Clean the connecting rods in a suitable solvent, rinse in hot water and blow dry with compressed air.

INSPECTION

INSPECTION - PISTONS

Inspect the pistons for damage and excessive wear. Check top of the piston, ring grooves, skirt and pin bore. Measure the piston skirt diameter. If the piston is out of limits, replace the piston.

PISTON SKIRT DIAMETER (MIN.)
101.775 mm (4.006 in.)

The upper groove only needs to be inspected for damage. Use a new piston ring to measure the clearance in the intermediate ring groove (Fig. 87). Minimum clearance is 0.045 mm (0.0018 inch), maximum clearance is 0.095 mm (.0037 inch). If the clearance of the intermediate ring exceeds specifications, replace the piston.

Use a new oil ring to measure the clearance in the oil groove (Fig. 87). Minimum clearance is 0.040 mm (0.0016 inch), maximum clearance is 0.085 mm (.0033 inch). If the clearance exceeds specifications, replace the piston.

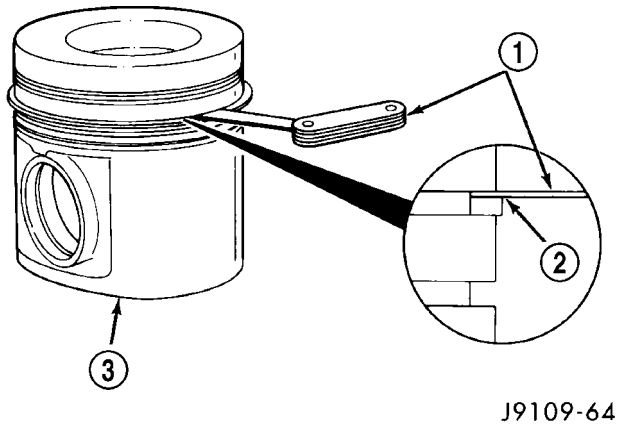

Fig. 87 Intermediate and Oil Ring Clearances

1 - FEELER GAUGE
2 - RING
3 - PISTON

Measure the pin bore (Fig. 88). The maximum diameter is 40.012 mm (1.5753 inch), Minimum is 40.006 mm (1.575 inch). If the bore is over limits, replace the piston.

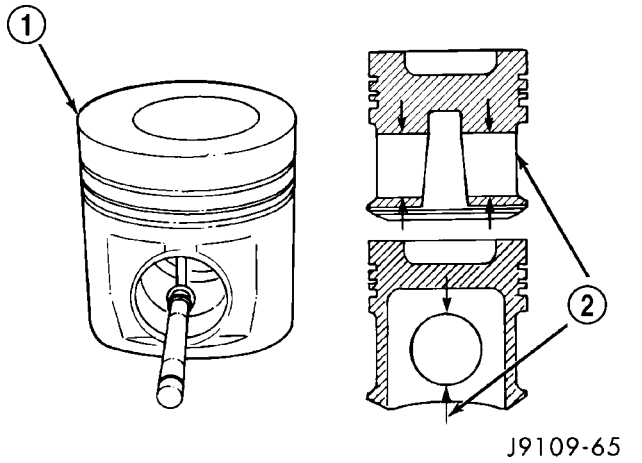

Fig. 88 Piston Pin Bore

1 - PISTON
2 - PIN BORE

PISTON & CONNECTING ROD (Continued)

Inspect the piston pin for nicks, gouges and excessive wear. Measure the pin diameter (Fig. 89). The minimum diameter is 39.990 mm (1.5744 inch), maximum 40.003 mm (1.5749 inch). If the diameter is out of limits, replace the pin.

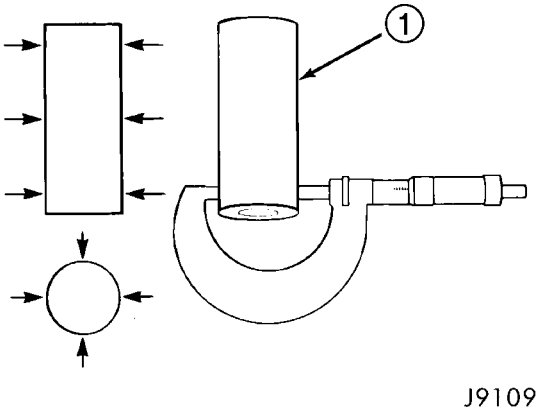

Fig. 89 Piston Pin Diameter

1 - PISTON PIN

INSPECTION—CONNECTING ROD

Inspect the connecting rod for damage and wear. The I-Beam section of the connecting rod cannot have dents or other damage. Damage to this part can cause stress risers which will progress to breakage.

Measure the connecting rod pin bore (Fig. 90). The maximum diameter is 40.042 mm (1.5765 inch), minimum diameter is 40.019 mm (1.5756 inch). If out of limits, replace the connecting rod.

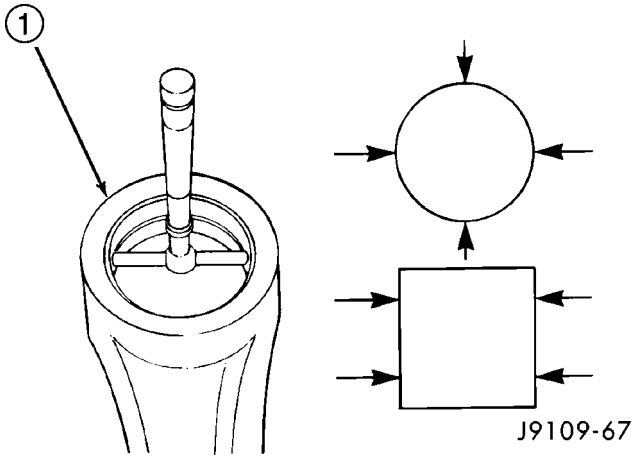

Fig. 90 Connecting Rod Pin Bore

1 - CONNECTING ROD

INSTALLATION

(1) Lubricate the cylinder bores with clean engine oil.

(2) Generously lubricate the rings and piston skirts with clean engine oil.

(3) Orientate the rings on the piston (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).

(4) Compress the rings using a piston ring compressor tool (Fig. 91). If using a strap-type ring compressor, make sure the inside end of the strap does not hook on a ring gap and break the ring.

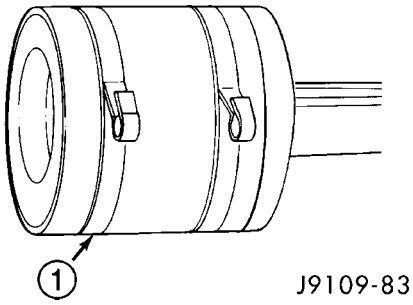

Fig. 91 Piston Ring Compressor Tool

1 - PISTON RING COMPRESSOR TOOL

(5) Bar the crankshaft so the rod journal for the piston to be installed is at BDC (Bottom Dead Center) - (Fig. 92).

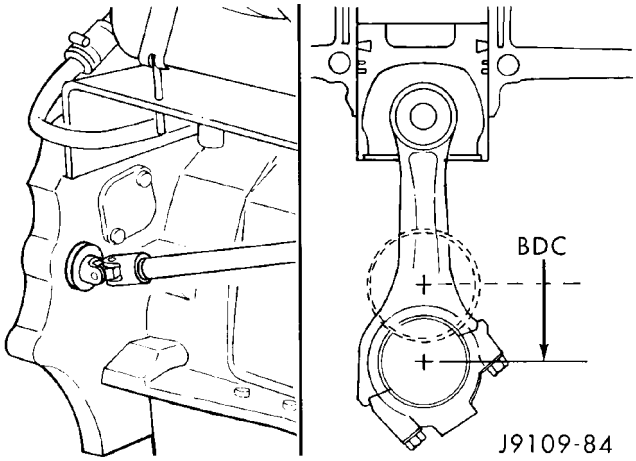

Fig. 92 Piston/Rod Assembly at BDC

(6) Make sure the front of the piston is oriented properly according to the marking on the top of the piston and the connecting rod is oriented properly.

(7) Position the piston and rod assembly into the cylinder bore with the front of the piston oriented properly according to the stamping in the top of the piston. Use care when you install the piston and connecting rod so the cylinder bore is not damaged. The long side of the connecting rod must be installed on the intake side of the engine.

(8) Push the piston into the bore until the top of the piston is approximately 50 mm (2 inch) below the top of the block. Carefully pull the connecting rod onto the crankshaft journal.

(9) Use clean engine oil to lubricate the threads and under the heads of the connecting rod bolts.

PISTON & CONNECTING ROD (Continued)

(10) **For fractured/split type connecting rods,** the long end of the rod must be installed towards the intake side of the engine.

(a) The connecting rod split/face must face toward the same side as the piston notch feature on the skirt. The split face will face toward the exhaust side of the engine if properly installed.

(11) Install the rod cap and bolts to the connecting rod. Tighten the connecting rod bolts evenly in 3 steps.

- Tighten the bolts to 30 N·m (22 ft. lbs.) torque.
- Tighten the bolts to 60 N·m (44 ft. lbs.) torque.
- Rotate 60° clockwise.

(12) The crankshaft must rotate freely. Check for freedom of rotation as the caps are installed. If the crankshaft does not rotate freely, check the installation of the rod bearing and the bearing size.

(13) Measure the side clearance between the connecting rod and the crankshaft. DO NOT measure the clearance between the cap and crankshaft.

(14) Install J-jet piston cooling nozzles if equipped.

(15) Install block stiffener. Torque to 43 N·m (32 ft. lbs.).

(16) Install the suction tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(17) Install the cylinder head onto the engine (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(18) Install a new filter and fill the crankcase with new engine oil. **Prefill the filter with clean oil.**

(19) Connect the battery negative cables and start engine.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Determine the piston diameter and obtain the appropriate ring set. The piston rings can be identified as shown in (Fig. 93).

(2) Position each ring in the cylinder and use a piston to square it with the bore at a depth of 89.0 mm (3.5 inch) - (Fig. 94).

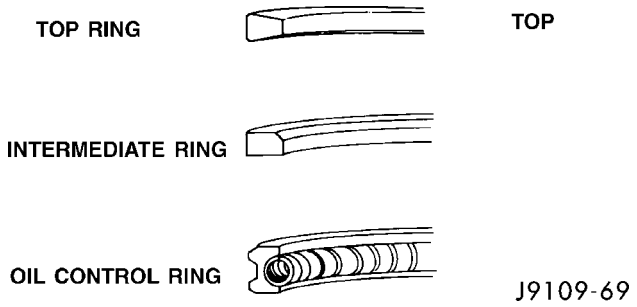

Fig. 93 Piston Ring Identification

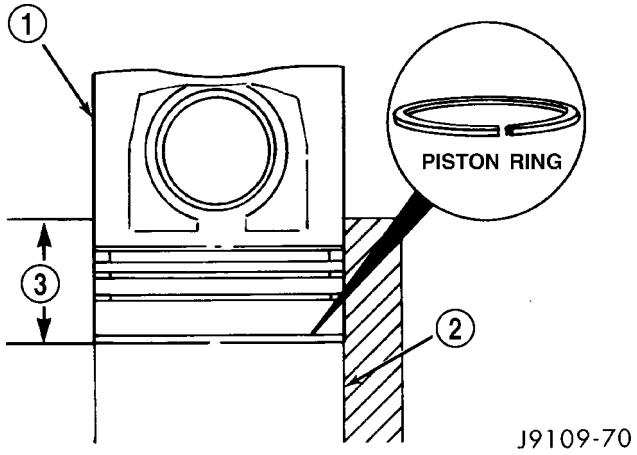

Fig. 94 Position of Ring in Cylinder Bore

1 - PISTON
2 - CYLINDER BORE
3 - DEPTH

(3) Use a feeler gauge to measure the piston ring gap.

PISTON RING GAP CHART		
TOP RING	0.26 - 0.36 mm	(0.010 - 0.014 in.)
INTERMEDIATE RING	0.85-1.15 mm	(0.033 - 0.045 in.)
OIL CONTROL RING	0.25-0.55 mm	(0.010 - 0.022 in.)

PISTON RINGS (Continued)

(4) The top surface of all of the rings are identified with the word TOP or the supplier's MARK. Assemble the rings with the word TOP or the supplier's MARK up.

(5) Position the oil ring expander in the oil control ring groove (bottom groove).

(6) Install the oil control ring with the end gap OPPOSITE the ends on the expander (Fig. 95).

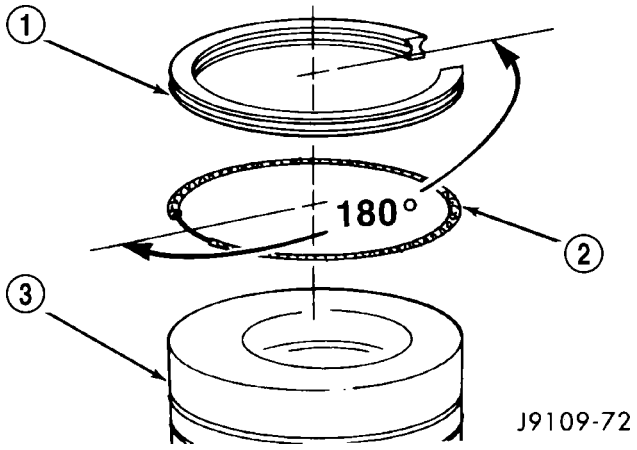

Fig. 95 Oil Control Ring/Expander Location in Groove

1 - OIL CONTROL RING
2 - EXPANDER
3 - PISTON

(7) Install the intermediate piston ring in the second groove.

(8) Install the top piston ring in the top groove (Fig. 96).

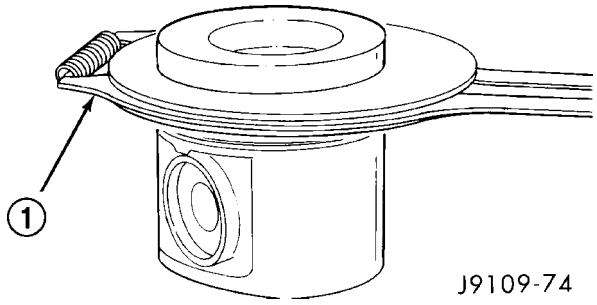

Fig. 96 Piston Ring Installation Tool

1 - PISTON RING INSTALLATION TOOL

(9) Position the rings as shown in (Fig. 97).

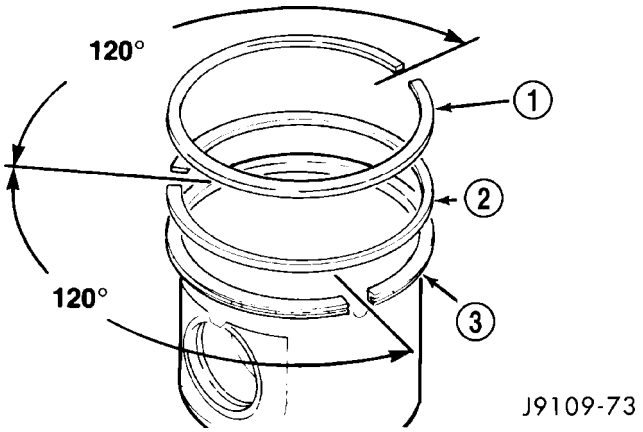

Fig. 97 Piston Ring Orientation

1 - TOP RING

3 - OIL CONTROL RING

VIBRATION DAMPER

REMOVAL

(1) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove the four (4) damper to crankshaft bolts and remove damper and speed indicator ring.

INSPECTION

(1) Inspect the damper hub for cracks and replace if any are found.

(2) Inspect the index lines on the damper hub and the inertia member (Fig. 98). If the lines are more than 1.59 mm (1/16 in.) out of alignment, replace the damper.

(3) Inspect the rubber member for deterioration or missing segments (Fig. 99).

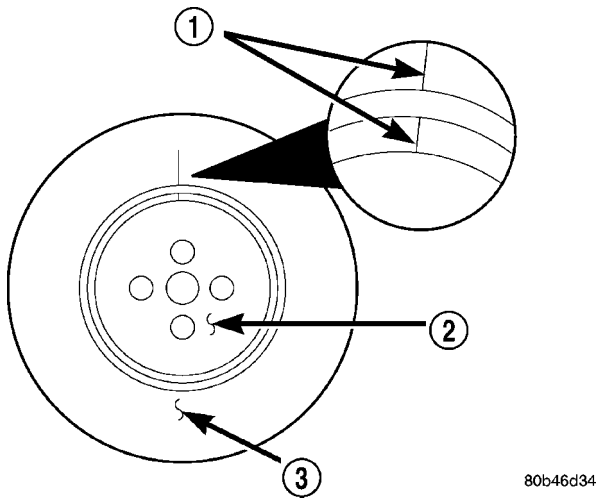

Fig. 98 Inspect Index Lines for Alignment

1 - INDEX LINES
2 - HUB
3 - INERTIA MEMBER

VIBRATION DAMPER (Continued)

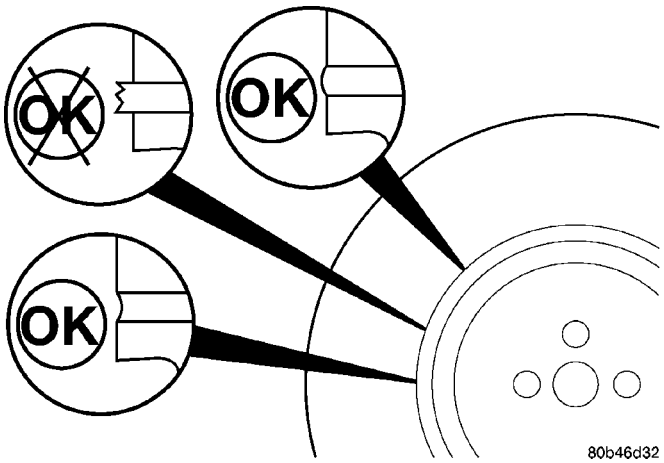

Fig. 99 Inspect Damper Rubber Member

INSTALLATION

(1) Install speed indicator ring.

NOTE: The speed indicator ring is located over a dowel pin.

(2) Install the crankshaft damper and bolts. Tighten bolts to 40 N·m (30 ft. lbs.) torque, plus an additional 60°.

NOTE: The damper must be installed so the hole is located over the dowel pin.

(3) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

FRONT MOUNT

REMOVAL

(1) Disconnect the battery negative cables.
(2) Remove the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(3) Raise vehicle on hoist.
(4) Install engine support fixture tool# 8534 and steel bracket tool # 8534A
(5) Loosen the thru-bolt and nut.
(6) Lift the engine SLIGHTLY and remove the insulator to block bolts (Fig. 101) (Fig. 100).
(7) Remove the insulator from the vehicle.

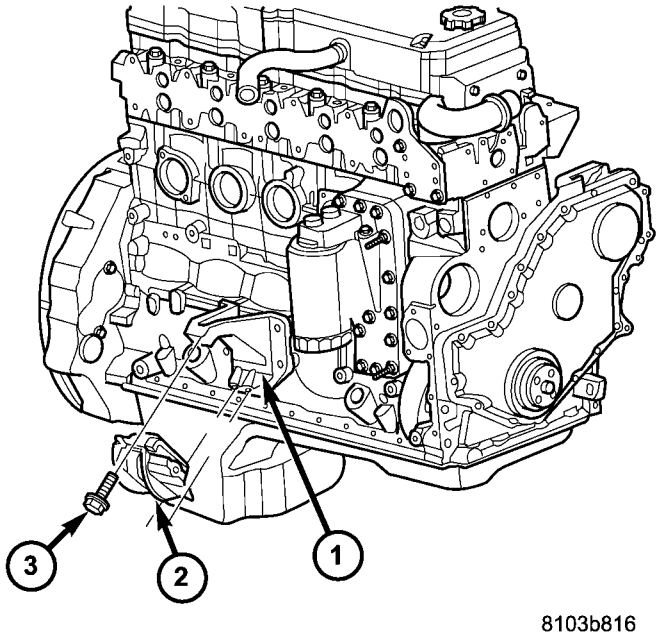

Fig. 100 RH Insulator

1 - Mount
2 - Insulator
3 - Bolt

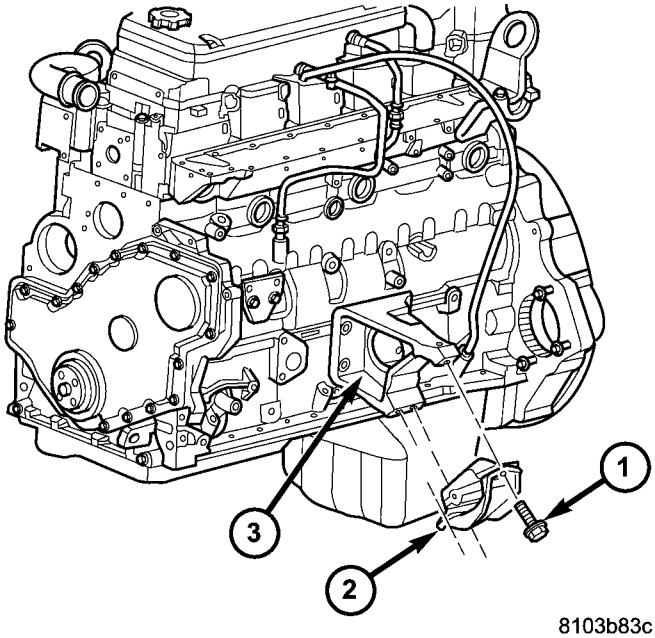

Fig. 101 LH Insulator

1 - Bolt
2 - Insulator
3 - Mount

FRONT MOUNT (Continued)

INSTALLATION

(1) With engine raised SLIGHTLY, position the insulator to the mount (Fig. 102) (Fig. 103). Install the bolts and torque to specification.

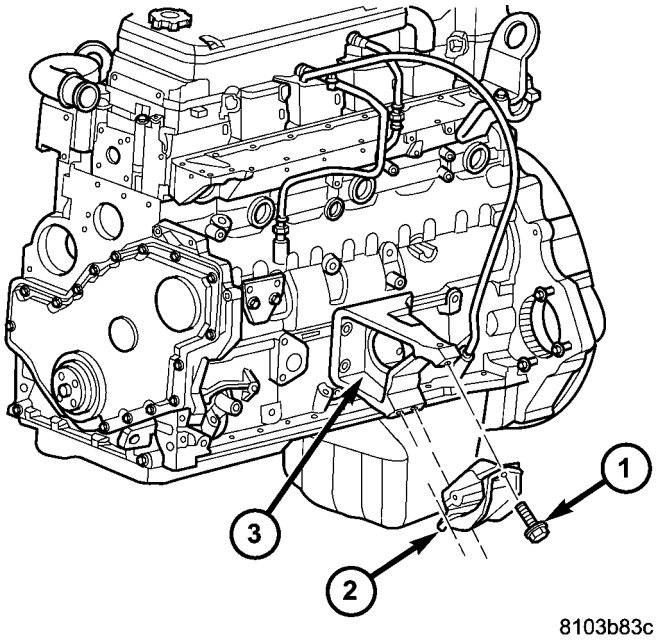

Fig. 102 LH Insulator

1 - Bolt
2 - Insulator
3 - Mount

(2) Lower the engine using tool # 8534, while guiding the mount and thru-bolt into the frame mounted support cushion brackets.

(3) Install the thru-bolt nut and tighten the nut to 95 N·m (70 ft. lbs.) torque.

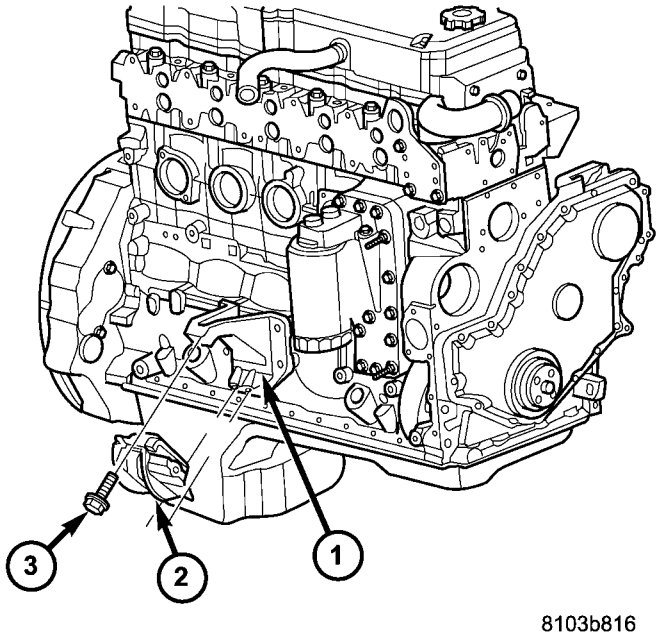

Fig. 103 RH Insulator

1 - Mount
2 - Insulator
3 - Bolt

(4) Remove the engine support fixture tool #8534.

(5) Lower the vehicle.

(6) Install the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(7) Connect the battery negative cables.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.
(2) Position a transmission jack in place.
(3) Remove support cushion stud nuts (Fig. 104).
(4) Raise rear of transmission and engine SLIGHTLY.
(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.
(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.
(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.
(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 104).
(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.
(5) Remove the transmission jack.
(6) Lower the vehicle.

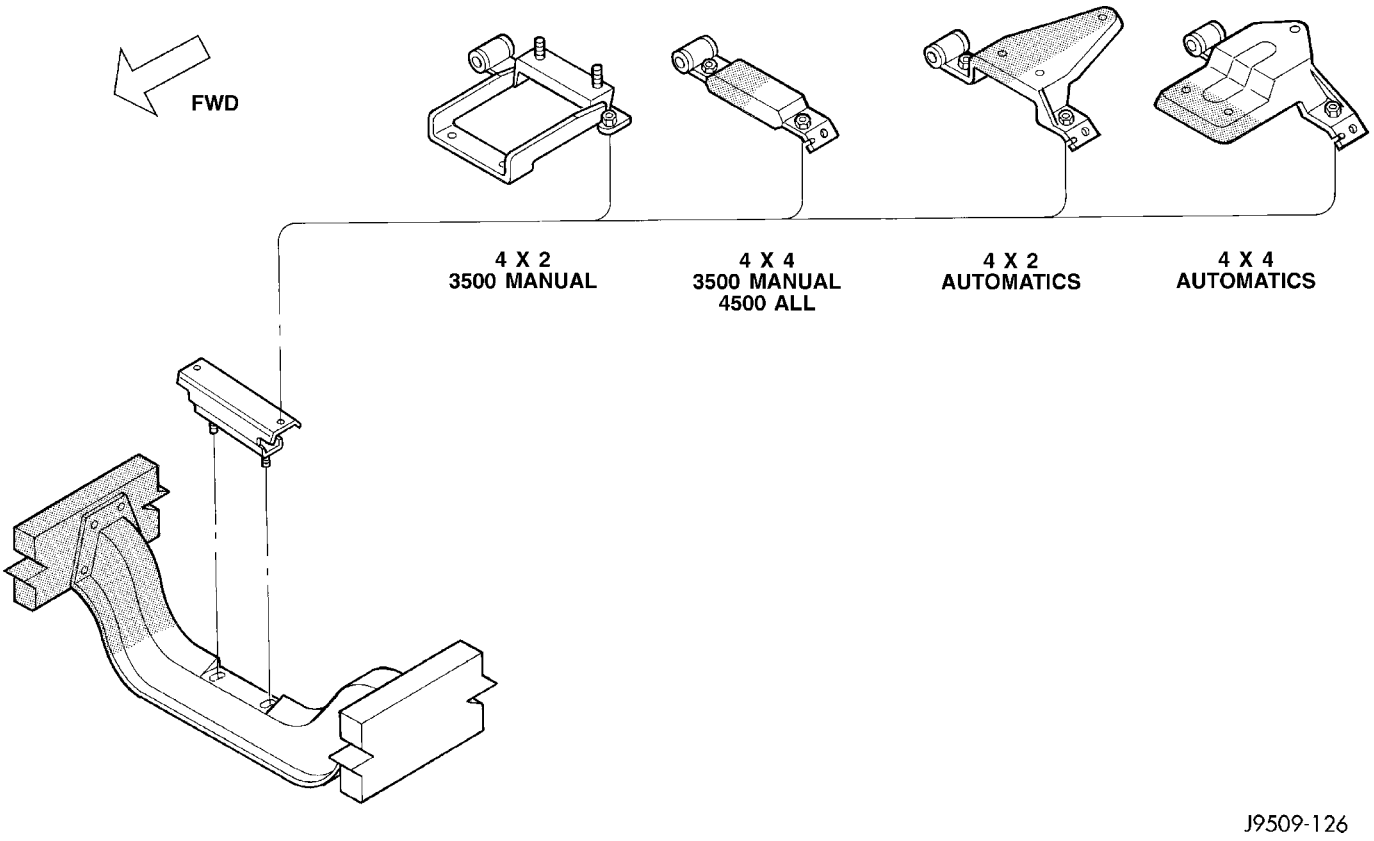

Fig. 104 Engine Rear Support Cushion Assembly

LUBRICATION

DESCRIPTION

NOTE: Refer to (Fig. 105) and (Fig. 106) for circuit illustrations.

A gear driven gerotor type oil pump is mounted behind the front gear cover in the lower right portion on the engine.

OPERATION

A gerotor style oil pump draws oil from the crankcase through the suction tube and delivers it through the block where it enters the oil cooler cover and pressure regulator valve. When oil pressure exceeds 517 kPa (75 PSI), the valve opens exposing the dump port, which routes excess oil back to the oil pump.

At the same time, oil is directed to a cast in passage in the oil cooler cover, leading to the oil cooler element. As the oil travels through the element plates, it is cooled by engine coolant traveling past the outside of the plates. It is then routed to the oil filter head and through a full flow oil filter. If a plugged filter is encountered, the filter by-pass valve opens, allowing unfiltered oil to lubricate the engine. This condition can be avoided by frequent oil and filter changes, per the maintenance schedules found in the owners manual. The by-pass valve is calibrated to open when it sees a pressure drop of more than 345 kPa (50 psi) across the oil filter.

The oil filter head then divides the oil between the engine and the turbocharger. The turbocharger receives filtered, cooled and pressurized oil through a supply line from the filter head. The oil lubricates the turbocharger and returns to the pan by way of a drain tube connecting the bottom of the turbocharger to a pressed in tube in the cylinder block.

Oil is then carried across the block to an angle drilling which intersects the main oil rifle. The main oil rifle runs the length of the block and delivers oil to the crankshaft main journals and valve train. Oil travels to the crankshaft through a series of transfer drillings (one for each main bearing) and lubricates a groove in the main bearing upper shell. From there another drilling feeds the camshaft main journals. The saddle jet piston cooling nozzles are also supplied by the main bearing upper shell. J-jet piston cooling nozzles are supplied by a separate oil rifle. Plugs are used in place of saddle jets when J-jets are used. J-jet hole locations are plugged when saddle jet cooling nozzles are used. Crankshaft internal cross-drillings supply oil to the connecting rod journals.

Another series of transfer drillings intersecting the main oil rifle supply the valve train components. Oil travels up the drilling, through a hole in the head gasket, and through a drilling in the cylinder head (one per cylinder), where it enters the rocker arm pedestal and is divided between the intake and exhaust rocker arm. Oil travels up and around the rocker arm mounting bolt, and lubricates the rocker shaft by cross drillings that intersect the mounting bolt hole. Grooves at both ends of the rocker shaft supply oil through the rocker arm where the oil travels to the push rod and socket balls (Fig. 105) and (Fig. 106).

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove the 1/8 npt plug from the top of the oil filter housing.

(2) Install Oil Pressure Line and Gauge Tool C-3292 with a suitable adapter.

(3) Start engine and warm to operating temperature.

(4) Record engine oil pressure and compare with engine oil pressure chart.

CAUTION: If engine oil pressure is zero at idle, DO NOT RUN THE ENGINE.

Engine Oil Pressure (MIN)

At Idle	68.9 kPa (10 psi)
At 2500 rpm	206.9 kPa (30 psi)

If minimum engine oil pressure is below these ranges, (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

(5) Remove oil pressure gauge and install the 1/8 npt plug.

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL LEVEL

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable oil level is in the SAFE RANGE on the engine oil dipstick (Fig. 107).

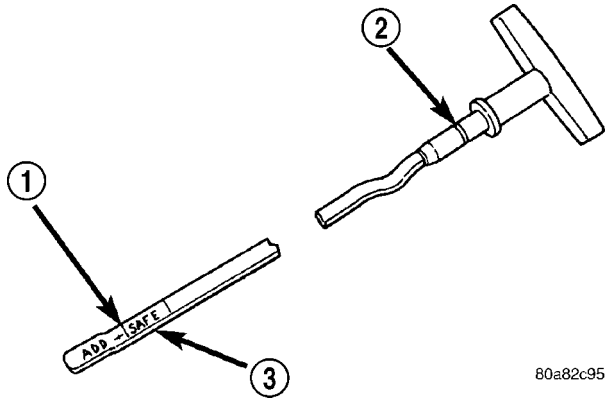

Fig. 107 Oil Level Indicator (Dipstick)

1 - ADD OIL MARK
2 - O-RING
3 - SAFE RANGE

(1) Position vehicle on level surface.
(2) With engine OFF, allow approximately 15 minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
(3) Wipe dipstick clean.
(4) Replace dipstick and verify it is seated in the tube.
(5) Remove dipstick, with handle held above the tip, take oil level reading.
(6) Add oil only if level is below the SAFE RANGE area on the dipstick.
(7) Replace dipstick

STANDARD PROCEDURE - ENGINE OIL SERVICE

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

NOTE: Change engine oil and filter at intervals specified in the owner's manual.

(1) Operate the engine until the water temperature reaches 60°C (140°F). Shut the engine off.
(2) Use a container that can hold at least 14 liters (15 quarts) to hold the used oil. Remove the oil drain plug and drain the used engine oil into the container.
(3) Always check the condition of the used oil. This can give you an indication of engine problems that might exist.
- Thin, black oil indicates fuel dilution.
- Milky discoloration indicates coolant dilution.

(4) Clean the area around the oil filter head. Remove the filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
(5) Install new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
(6) Clean the drain plug and the sealing surface of the pan. Check the condition of the threads and sealing surface on the oil pan and drain plug.
(7) Install the drain plug. Tighten the plug to 50 N·m (37 ft. lbs.) torque.
(8) Use only High-Quality Multi-Viscosity lubricating oil in the Cummins Turbo Diesel engine. Choose the correct oil for the operating conditions (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
(9) Fill the engine with the correct grade of new oil (Refer to LUBRICATION & MAINTENANCE/FLUID CAPACITIES - SPECIFICATIONS).
(10) Start the engine and operate it at idle for several minutes. Check for leaks at the filter and drain plug.
(11) Stop engine. Wait 15 minutes to allow the oil to drain back to the pan and check the level again.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle's engine.

OIL COOLER & LINES

CLEANING

CLEANING AND INSPECTION

Clean the sealing surfaces.

Apply 483 kPa (70 psi) air pressure to the element to check for leaks. If the element leaks, replace the element.

OIL FILTER

REMOVAL

(1) Clean the area around the oil filter head. Remove the filter from below using a cap-style filter wrench.

(2) Clean the gasket surface of the filter head. The filter canister O-Ring seal can stick on the filter head. Make sure it is removed.

INSTALLATION

(1) Fill the oil filter element with clean oil before installation. Use the same type oil that will be used in the engine.

(2) Apply a light film of lubricating oil to the sealing surface before installing the filter.

CAUTION: Mechanical over-tightening may distort the threads or damage the filter element seal.

(3) Install the filter until it contacts the sealing surface of the oil filter adapter. Tighten filter an additional ½ turn.

OIL PAN

REMOVAL

(1) Disconnect the battery negative cables.

(2) Install engine support fixture # 8534.

(3) Raise vehicle on hoist.

(4) Disconnect starter cables from starter motor.

(5) Remove transmission and transfer case (if equipped).

(6) Remove flywheel or flexplate.

(7) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL) and transmission adapter plate assembly.

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

(8) Drain the engine oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

(9) Install the oil pan drain plug if sealing surface is not damaged and tighten to 50 N·m (37 ft. lbs.) torque.

(10) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.

(11) Remove oil pan and suction tube.

CLEANING

Remove all gasket material from the oil pan and cylinder block sealing surfaces. Extra effort may be required around T-joint areas. Clean oil pan and flush suction tube with a suitable solvent.

INSPECTION

Inspect the oil pan, suction tube, and tube braces for cracks and damage. Replace any defective component. Inspect the oil drain plug and drain hole threads. Inspect the oil pan sealing surface for straightness. Repair any minor imperfections with a ball-peen hammer. Do not attempt to repair an oil pan by welding.

INSTALLATION

(1) Fill the T-joint between the pan rail/gear housing and pan rail/rear seal retainer with sealant. Use Mopar® Silicone Rubber Adhesive Sealant or equivalent.

(2) Place suction tube in oil pan and guide them into place. Using a new tube to block gasket, install and tighten the suction tube bolts by hand. Starting with the oil pump inlet bolts, tighten the bolts to 24 N·m (18 ft. lbs.) torque. Tighten the remaining tube brace bolts to 43 N·m (32 ft. lbs.) torque.

(3) Starting in the center and working outward, tighten the oil pan bolts to 28 N·m (21 ft. lbs.) torque.

(4) Install the flywheel housing assembly with the starter motor attached and tighten bolts to 77 N·m (57 ft. lbs.) torque.

(5) Connect starter motor cables.

(6) Install the flywheel or flexplate. Torque to 137 N·m (101 ft. lbs.).

(7) Install transmission and transfer case (if equipped).

(8) Lower vehicle.

(9) Remove the engine support fixture # 8534.

(10) Install battery negative cables.

(11) Fill the crankcase with new engine oil.

(12) Start engine and check for leaks. Stop engine, check oil level, and adjust, if necessary.

OIL PRESSURE RELIEF VALVE

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the threaded plug, spring and plunger (Fig. 108). Insert a finger or a seal pick to lift the plunger from the bore.

NOTE: If the plunger is stuck in the bore, it will be necessary to remove the filter head.

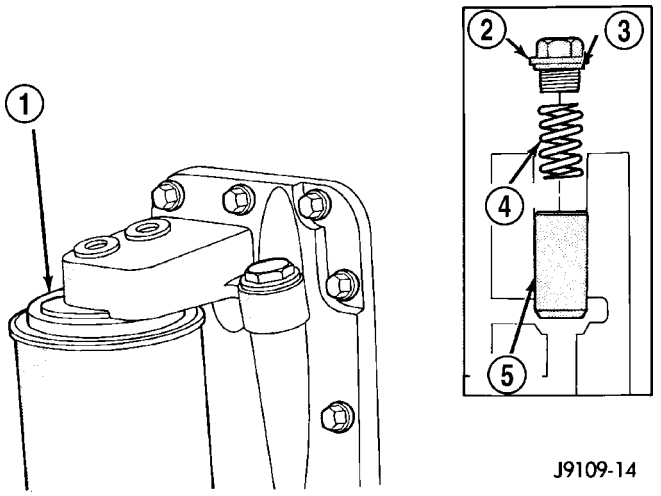

Fig. 108 Oil Pressure Regulator

1 - OIL FILTER
2 - PLUG
3 - GASKET
4 - SPRING
5 - VALVE

CLEANING

(1) Clean the regulator spring and plunger with a suitable solvent and blow dry with compressed air. If the plunger bore requires cleaning, it is necessary to remove the oil filter head to avoid getting debris into the engine.

INSPECTION

Inspect the plunger and plunger bore for cracks and excessive wear. Polished surfaces are acceptable. Verify that the plunger moves freely in the bore.

Check the spring for height and load limitations (Fig. 109). Replace the spring if out of limits shown in the figure.

INSTALLATION

(1) Install the plunger, spring, and plug as shown in (Fig. 108). Tighten the plug to 80 N·m (59 ft. lbs.) torque.

(2) Connect the battery negative cables.

(3) Start the engine and verify that it has oil pressure.

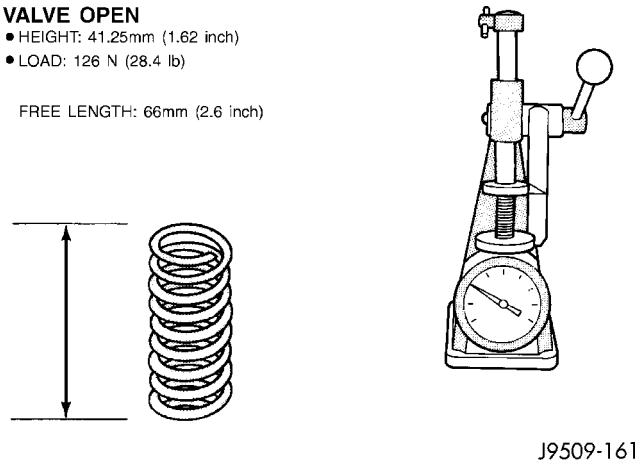

Fig. 109 Oil Pressure Regulator Spring Check

OIL PRESSURE SWITCH

REMOVAL

(1) Disconnect the battery negative cables.

(2) Disconnect the oil pressure switch connector.

(3) Using a suitable socket, remove the oil pressure switch from the block (counter-clockwise).

INSTALLATION

(1) If the switch is not being replaced, replace and lubricate the o-ring.

(2) Install the oil pressure switch and tighten to 18 N·m (159 in. lbs.) torque.

(3) Connect oil pressure switch connector.

(4) Connect the battery negative cables.

(5) Start engine and check for oil leaks at the switch.

OIL PUMP

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove the fan support/hub assembly.

(5) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and speed indicator ring.

(6) Remove power steering pump.

(7) Remove accessory drive belt tensioner.

(8) Remove the gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - REMOVAL).

OIL PUMP (Continued)

(9) Remove the four mounting bolts and pull the oil pump from the bore in the cylinder block (Fig. 110).

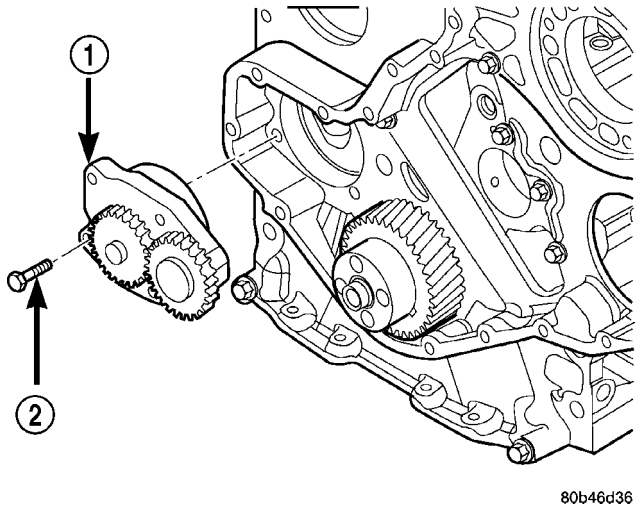

Fig. 110 Oil Pump Removal/Installation

1 - OIL PUMP
2 - BOLT (4)

CLEANING

Clean all parts in solvent and dry with compressed air. Clean the old sealer residue from the back of the gear housing cover and front of the gear housing.

INSPECTION

Disassemble and inspect the oil pump as follows:

(1) Visually inspect the lube pump gears for chips, cracks or excessive wear.

(2) Remove the back plate (Fig. 111).

(3) Mark TOP on the gerotor planetary using a felt tip pen (Fig. 111).

(4) Remove the gerotor planetary (Fig. 111). Inspect for excessive wear or damage. Inspect the pump housing and gerotor drive for damaged and excessive wear.

(5) Install the gerotor planetary in the original position.

(6) Measure the tip clearance (Fig. 112). Maximum clearance is 0.1778 mm (0.007 inch). If the oil pump is out of limits, replace the pump.

(7) Measure the clearance of the gerotor drive/ gerotor planetary to port plate (Fig. 113). Maximum clearance is 0.127 mm (0.005 inch). If the oil pump is out of limits, replace the pump.

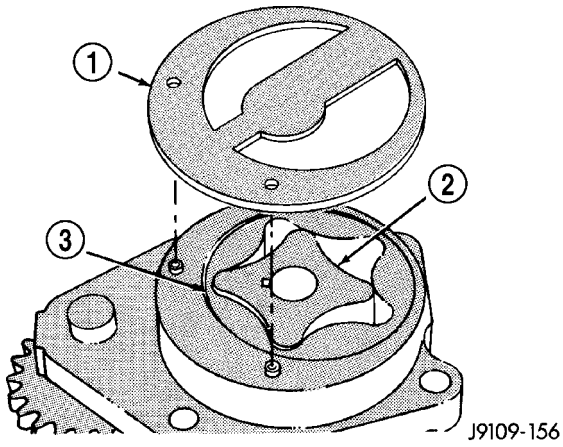

Fig. 111 Gerotor Planetary and Gerotor

1 - OIL PUMP BACK PLATE
2 - GEROTOR
3 - GEROTOR PLANETARY

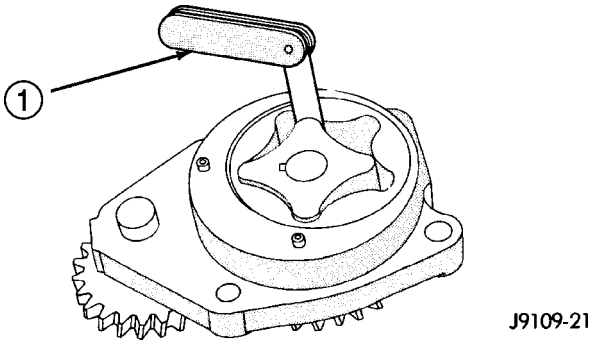

Fig. 112 Measuring Tip Clearance

1 - FEELER GAUGE

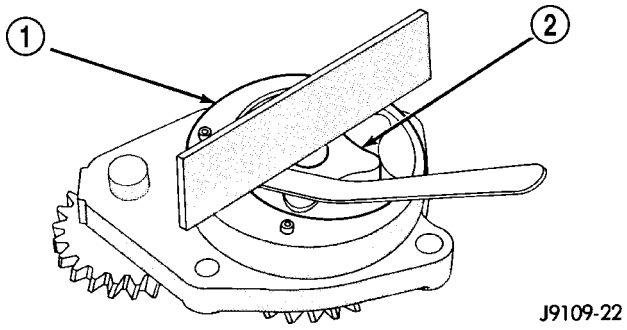

Fig. 113 Measuring Gerotor to Port Plate Clearance

1 - PORT PLATE
2 - GEROTOR

OIL PUMP (Continued)

(8) Measure the clearance of the gerotor planetary to the body bore (Fig. 114). Maximum clearance is 0.381 mm (0.015 inch). If the oil pump is out of limits, replace the pump.

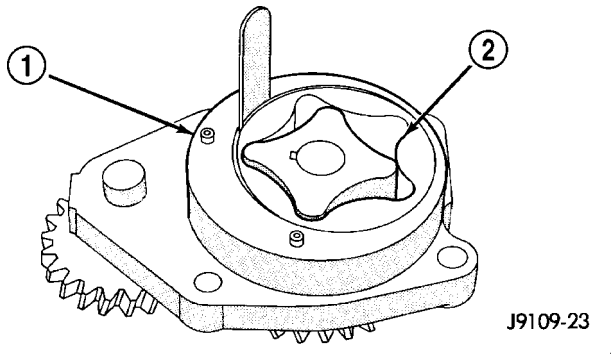

Fig. 114 Measuring Gerotor Planetary to Body Bore Clearance

1 - BODY BORE
2 - GEROTOR PLANETARY

(9) Measure the gears backlash (Fig. 115). The limits of a used pump is 0.15- 0.25 mm (0.006-0.010 inch). If the backlash is out of limits, replace the oil pump.

(10) Install the back plate.

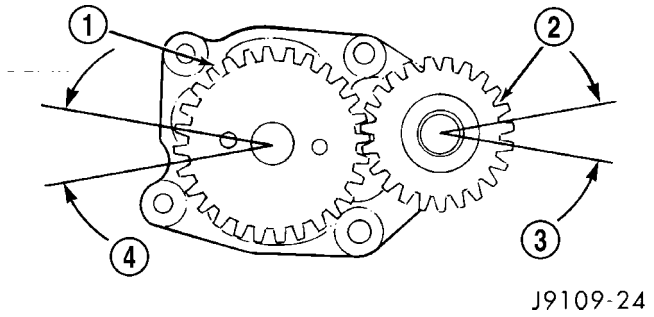

Fig. 115 Measure Gear Backlash

1 - OIL PUMP DRIVE GEAR
2 - IDLER GEAR
3 - BACKLASH
4 - BACKLASH

INSTALLATION

(1) Lubricate the pump with clean engine oil. Filling the pump with clean engine oil during installation will help to prime the pump at engine start up.

(2) Install the pump (Fig. 110). Verify the idler gear pin is installed in the locating bore in the cylinder block. Tighten the oil pump mounting bolts in two steps, in the sequence shown in (Fig. 116).

- Step 1—Tighten to 8 N·m (71 in. lbs.) torque.
- Step 2—Tighten to 24 N·m (18 ft. lbs.) torque.

(3) The back plate on the pump seats against the bottom of the bore in the cylinder block. When the pump is correctly installed, the flange on the pump will not touch the cylinder block.

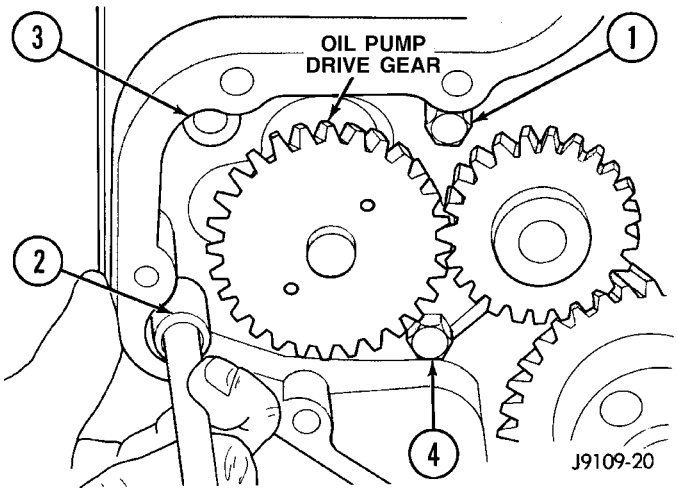

Fig. 116 Oil Pump Mounting Bolt Torque Sequence

(4) Measure the idler gear to pump drive gear backlash and the idler gear to crankshaft gear backlash (Fig. 117). The backlash should be 0.15- 0.25 mm (0.006-0.010 inch). If the backlash is out of limits, replace the oil pump.

(5) If the adjoining gear moves when you measure the backlash, the reading will be incorrect.

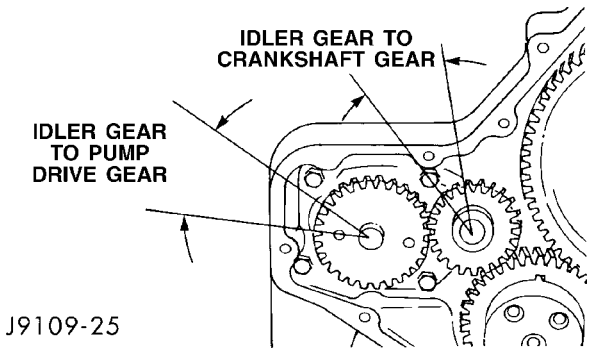

Fig. 117 Idler Gear to Pump Drive Gear and Crankshaft Gear Backlash

(6) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

(7) Install the gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - INSTALLATION).

(8) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION) and speed indicator ring.

(9) Install the fan support/hub assembly Refer to (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(10) Install power steering pump.

(11) Install accessory drive belt tensioner. Torque bolt to 43 N·m (32 ft. lbs.).

(12) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

OIL PUMP (Continued)

(13) Install the cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(14) Connect battery negative cables.
(15) Start engine and check for oil leaks.

INTAKE MANIFOLD

REMOVAL

(1) Disconnect the battery negative cables.
(2) Remove the charge air cooler outlet tube from the air inlet housing (Fig. 118).
(3) Remove the engine oil dipstick tube mounting bolt (Fig. 118).
(4) Remove dipstick support at fuel filter housing. Position dipstick tube to the side.
(5) Disconnect the air grid heater power cables at the cable mounting studs.
(6) Disconnect the ground strap at the intake cover.
(7) Remove the engine wiring harness connections at the air inlet housing elbow.
(8) Remove the four (4) air inlet housing mounting bolts and remove the housing from top of the heater elements.
(9) Remove the intake air grid heater from the manifold (Fig. 119).
(10) Remove the high pressure fuel lines and fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - REMOVAL).
(11) Remove APPS bracket from cylinder head to gain access to front intake manifold cover bolts.
(12) Disconnect manifold air temperature/pressure sensor connector.
(13) Remove the remaining intake manifold cover-to-cylinder head bolts.
(14) Remove the intake manifold cover and gasket. Keep the gasket material and any other material out of the air intake.
(15) Clean the intake manifold cover and cylinder head sealing surface.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

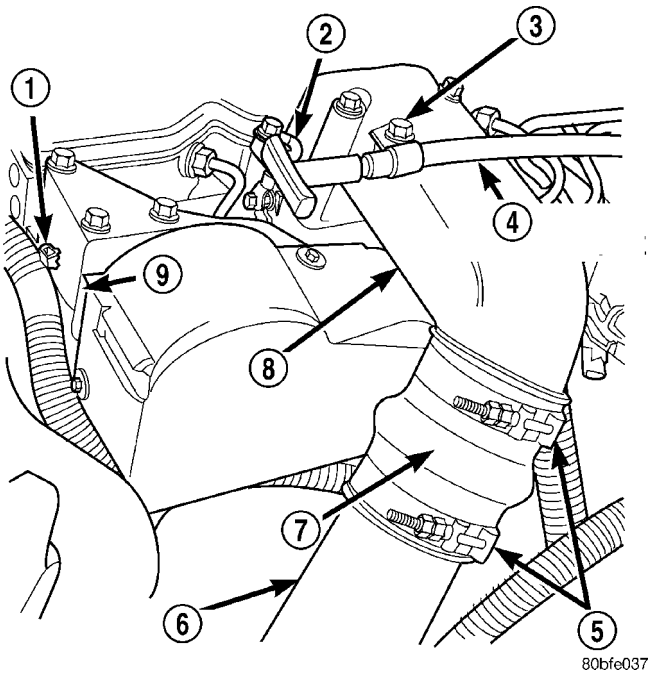

Fig. 118 Charge Air Cooler Air Tube

9 - CABLE BRACKET HOUSING

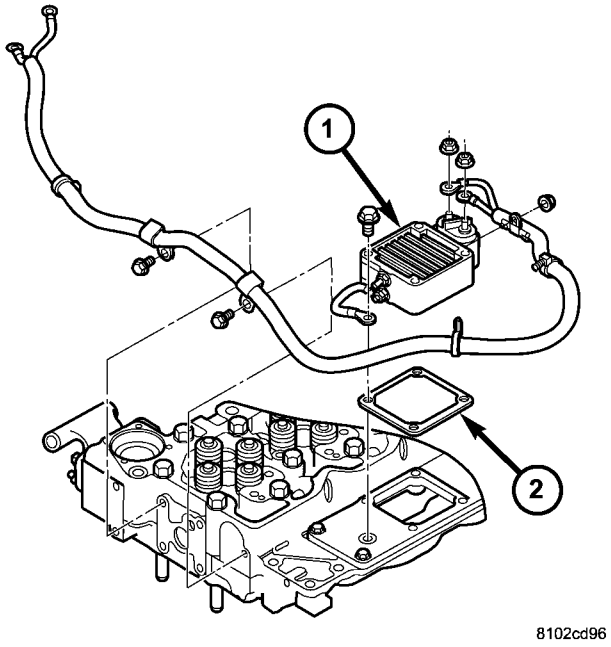

Fig. 119 Intake Air Grid Heater

1 - INTAKE AIR GRID HEATER
2 - GASKET

INTAKE MANIFOLD (Continued)

INSTALLATION

(1) Using a new gasket, install the intake manifold cover.

(2) Install the cover-to-cylinder head bolts that do not hold down the fuel rail. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Install the high pressure rail and fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/ FUEL LINES - INSTALLATION).

(4) Using two (2) new gaskets, install the intake air grid heater and air inlet housing. Position the ground cable and install and tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(5) Connect the manifold air temperature/pressure sensor connector.

(6) Install and tighten the air intake heater power supply nuts to 14 N·m (120 in. lbs.) torque.

(7) Install the APPS bracket. Torque fasteners to 43 N·m (32ft lbs.) torque.

(8) Install oil dipstick tube support at fuel filter housing.

(9) Install the engine oil dipstick tube and mounting bolt.

(10) Position the charge air cooler outlet tube onto the air inlet housing. Tighten the clamps to 11 N·m (100 in. lbs.) torque.

(11) Attach the engine wire harness to the air inlet housing at two locations.

(12) Prime the fuel system. Refer to the fuel priming procedure in Group 14, Fuel System.

(13) Connect the battery negative cables.

EXHAUST MANIFOLD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Disconnect the exhaust pipe from the turbocharger elbow.

(4) Disconnect oil drain tube from turbocharger.

(5) Lower vehicle.

(6) Disconnect the turbocharger air inlet hose.

(7) Remove air cleaner assembly.

(8) Disconnect the turbocharger oil supply line.

(9) Disconnect the charge air cooler inlet pipe from the turbocharger.

(10) Remove the turbocharger and gasket from the exhaust manifold.

(11) Remove the cab heater return pipe nuts from the exhaust manifold stud. Position the tube out of the way.

(12) Remove heat shield.

(13) Remove exhaust manifold bolt lockplates.

(14) Remove the exhaust manifold-to-cylinder head bolts and spacers (Fig. 120).

(15) Remove the exhaust manifold and gaskets (Fig. 120).

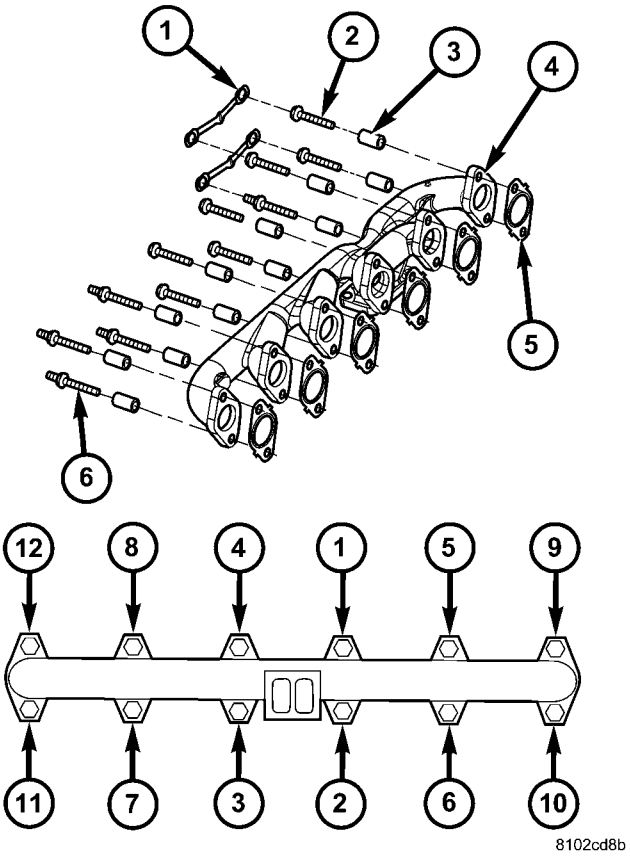

Fig. 120 Exhaust Manifold and Gaskets

1 - RETAINING STRAP
2 - BOLT (7)
3 - SPACER
4 - MANIFOLD, EXHAUST
5 - GASKET
6 - BOLT (5)

CLEANING

Clean the cylinder head and exhaust manifold sealing surfaces with a suitable scraper. Use a Scotch-Brite™ pad or equivalent.

INSPECTION

Inspect the exhaust manifold for cracks. Measure the exhaust manifold for flatness. Place a ruler over all of the exhaust ports and insert a feeler gauge between the port flange and the ruler. Maximum deviation from flat is 0.20 mm (.008 inch).

INSTALLATION

(1) Using new gaskets, install the exhaust manifold and gaskets. Install the bolts and spacers and tighten the bolts in the sequence shown in to 43 N·m (32 ft. lbs.) torque.

(2) Retorque the four center bolts.

EXHAUST MANIFOLD (Continued)

(3) Install heat shield and torque nuts to 15 Nm (11 ft. lbs.).
(4) Install cab heater tube.
(5) Install exhaust manifold bolt retention straps.
(6) Install the cab heater return hose to the manifold bolt stud. Tighten the nut to 24 N·m (18 ft. lbs.) torque.
(7) Install the turbocharger and a new gasket. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 43 N·m (32 ft. lbs.) torque.
(8) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting on the turbo. Rotate the turbocharger impeller by hand to distrubute the oil thoroughly.
(9) Install and tighten the oil supply line fitting nut to 24 N·m (18 ft. lbs.) torque.
(10) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 11 N·m (100 in. lbs.) torque.
(11) Position the air inlet hose to the turbocharger. Tighten the clamp to 11 N·m (100 in. lbs.) torque.
(12) Raise vehicle on hoist.
(13) Install the oil drain tube and a new gasket to the turbocharger. Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.
(14) Connect the exhaust pipe to the turbocharger and tighten the bolts to 11 N·m (100 ft. lbs.) torque.
(15) Lower the vehicle.
(16) Connect the battery negative cables.
(17) Start the engine to check for leaks.

VALVE TIMING

STANDARD PROCEDURE - TIMING VERIFICATION

(1) Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(2) Remove fuel injector from cylinder number 1(Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ FUEL INJECTOR - REMOVAL).
(3) Using Special Tool 7471B rotate the engine until the TDC mark on the damper is at 12 o'clock.
(4) Using a 8 in.x 1/4 in. dowel rod inserted into cylinder number 1, rock the crankshaft back and forth to verify piston number 1 is at TDC.
(5) With cylinder number still at TDC, inspect the keyway on the crankshaft gear for proper alignment (12 o'clock position).
(6) If the keyway is not at 12 o'clock position replace the crankshaft gear assembly.
(7) If the keyway is at 12 o'clock position, remove front gear cover and verify timing mark alignment between the camshaft gear and crankshaft gear, if not aligned inspect keyway on camshaft gear.
(8) Inspect keyway on camshaft gear for proper alignment with the key in the camshaft, if alignment is off replace the camshaft/gear assembly.
(9) If timing marks alignment is off and no damage is found at either the crankshaft or camshaft gear keyways, realign timing marks as necessary.

GEAR HOUSING

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise vehicle on hoist.
(3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).
(4) Lower vehicle.
(5) Remove radiator upper hose.
(6) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.
(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.
(8) Remove lower fan shroud fasteners. Disconnect fan drive wire harness.
(9) Remove the upper fan shroud-to-radiator mounting bolts.
(10) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(11) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(12) Remove the cooling fan support/hub from the front of the engine.
(13) Raise the vehicle on hoist.
(14) Remove the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and speed indicator ring.
(15) Lower the vehicle.
(16) Remove the power steering pump.
(17) Remove the accessory drive belt tensioner.
(18) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.
(19) Remove the fuel injection pump (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - REMOVAL).
(20) Disconnect the camshaft position sensor connector.
(21) Disconnect and remove engine speed sensor.
(22) Remove the camshaft (Refer to 9 - ENGINE/ ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).
(23) Remove the six front oil pan fasteners.

GEAR HOUSING (Continued)

(24) Remove the gear housing fasteners.

NOTE: Use care when removing the gear housing, to avoid damage to the oil pan gasket, as the gasket will be reused if it is not damaged.

(25) Slide a feeler gauge between the gear housing and oil pan gasket, to break the gasket seal.
(26) Remove the gear housing and gasket.
(27) Clean the gasket material from the cylinder block and gear housing.

INSTALLATION

(1) Inspect oil pan gasket. If torn, gasket must be replaced.
(2) Install a new gear housing gasket onto cylinder block and trim any excesss gasket material flush to oil pan rail.
(3) Install the gear housing. Torque bolts to 24 N·m (18 ft. lbs.) (Fig. 121).

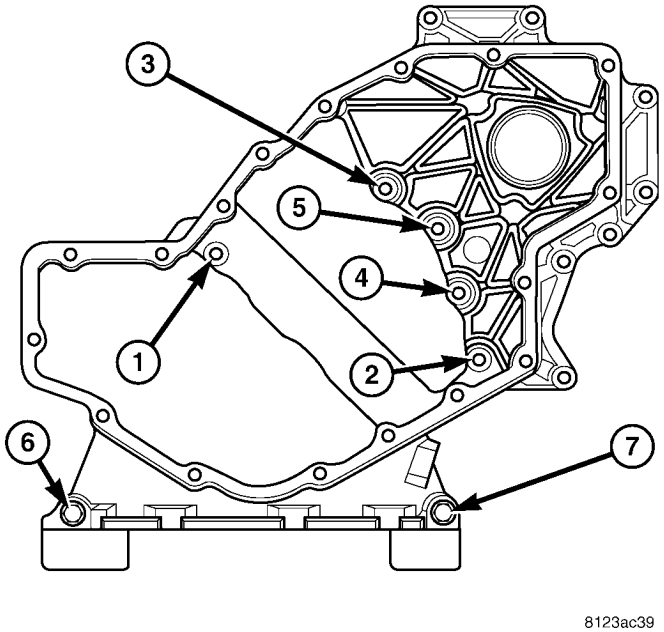

Fig. 121 GEAR HOUSING CAPSCREW TORQUE SEQUENCE

(4) If a new housing is installed, the camshaft position sensor, and engine speed sensor must be transferred to the new housing.
(5) Connect the camshaft position sensor connector.
(6) Install and connect engine speed sensor.
(7) Install the injection pump (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - INSTALLATION).
(8) Install the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - INSTALLATION). Align the crankshaft and camshaft gear marks as shown in (Fig. 122).

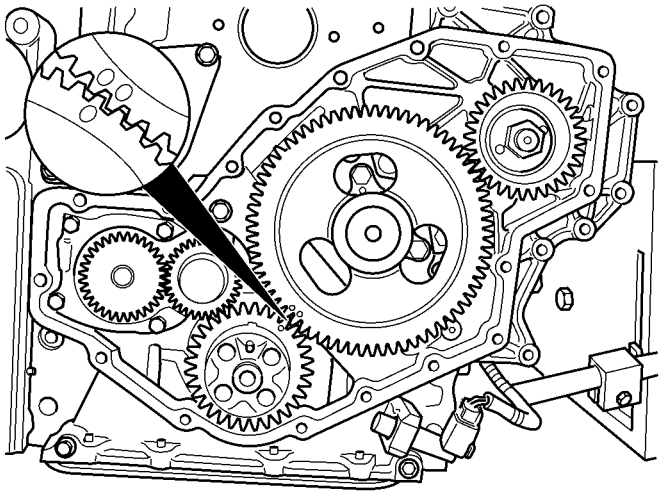

Fig. 122 Timing Mark Alignment

(9) Install a new front crankshaft seal into the gear cover.
(10) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.
(11) Using the seal pilot to align the cover, install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.
(12) Remove the seal pilot. Install front seal dust shield.
(13) Raise the vehicle.
(14) Trim any excess gear housing gasket to make it flush with the oil pan rail.
(15) Install the crankshaft damper and speed indicator ring (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION). Torque bolts to 40 Nm (30 ft. lbs.), plus an additional 60°.
(16) Lower vehicle.
(17) Install the fan support/hub assembly and tighten bolts to 32 N·m (24 ft. lbs.) torque.
(18) Install the power steering pump.
(19) Install the accessory drive belt tensioner. Torque bolt to 43 N·m (32 ft. lbs.) torque.
(20) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(21) Install the upper cooling fan and shroud together (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(22) Install lower shroud and connect fan drive harness connector.

GEAR HOUSING (Continued)

(23) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(24) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(25) Install the radiator upper hose and clamps.

(26) Add engine oil.

(27) Add coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(28) Connect the battery cables.

(29) Start engine and inspect for leaks.

GEAR HOUSING COVER

REMOVAL

(1) Disconnect both battery negative cables.

(2) Raise vehicle on hoist.

(3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Lower vehicle.

(5) Remove radiator upper hose.

(6) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(8) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(9) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Remove the cooling fan support/hub from the front of the engine.

(11) Raise the vehicle on hoist.

(12) Remove power steering pump.

(13) Remove accessory drive belt tensioner.

(14) Remove the crankshaft damper and speed indicator ring (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(15) Lower the vehicle.

(16) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.

INSTALLATION

(1) Install a new front crankshaft oil seal.

(2) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the seal.

(3) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(4) Using the seal pilot to align the cover (Fig. 123), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

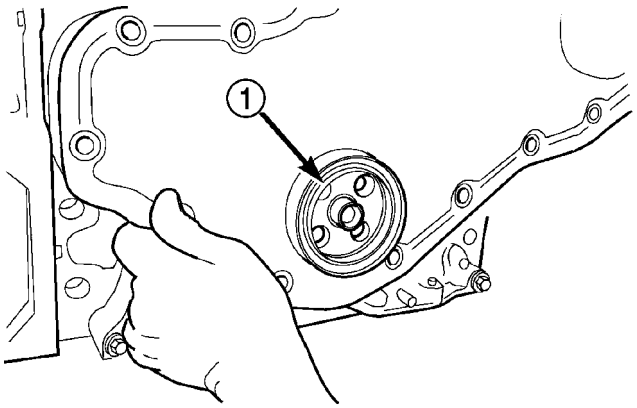

Fig. 123 Installing Cover with Seal Pilot

1 - SEAL PILOT

(5) Remove the seal pilot. Install front seal dust shield.

(6) Raise the vehicle.

(7) Install the speed indicator ring and the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Lower vehicle.

(9) Install the fan support/hub assy, and tighten bolts to 32 N·m (24 ft. lbs.) torque.

(10) Install power steering pump.

(11) Install accessory drive belt tensioner. Torque bolt to 43 N·m (32 ft. lbs.) torque.

(12) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Install the cooling fan and shroud together (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(14) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(15) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(16) Install the radiator upper hose and clamps.

(17) Add coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(18) Connect the battery cables.

(19) Start engine and inspect for leaks.

EXHAUST SYSTEM

DESCRIPTION

DESCRIPTION

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The federal gasoline engine exhaust system consists of engine exhaust manifolds, exhaust pipes, catalytic converter(s), extension pipe (if needed), exhaust heat shields, muffler and exhaust tailpipe (Fig. 1), (Fig. 2), (Fig. 3)

The California emission vehicles exhaust system also contains the above components as well as mini catalytic converters added to the exhaust pipe.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. Minimum clearance between any exhaust component and the body or frame is 25.4 mm (1.0 in.). If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

DESCRIPTION - 5.9L DIESEL

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, exhaust pipe, resonator, extension pipe, muffler and exhaust tailpipe.

California emission vehicles include a catalytic converter.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. The exhaust components should be kept a minimum of 25.4 mm (1.0 in.) away from the body and frame. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

EXHAUST SYSTEM (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - GAS ENGINE

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten clamps/bolts at leaking joints.
	2. Rusted or blown out muffler.	2. Replace muffler. Inspect exhaust system.
	3. Broken or rusted out exhaust pipe.	3. Replace exhaust pipe.
	4. Exhaust pipe leaking at manifold flange.	4. Tighten/replace flange attaching nuts/bolts.
	5. Exhaust manifold cracked or broken.	5. Replace exhaust manifold.
	6. Leak between exhaust manifold and cylinder head.	6. Tighten exhaust manifold to cylinder head bolts.
	7. Catalytic converter rusted or blown out.	7. Replace catalytic converter assy.
	8. Restriction in exhaust system.	8. Remove restriction, if possible. Replace restricted part if necessary.
CAUTION: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.		

EXHAUST SYSTEM (Continued)

DIAGNOSIS AND TESTING - DIESEL ENGINE

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten clamps/bolts at leaking joints.
	2. Rusted or blown out muffler.	2. Replace muffler. Inspect exhaust system.
	3. Broken or rusted out exhaust pipe.	3. Replace exhaust pipe.
	4. Exhaust pipe leaking at manifold flange.	4. Tighten/replace flange attaching nuts/bolts.
	5. Exhaust manifold cracked or broken.	5. Replace exhaust manifold.
	6. Leak between exhaust manifold and cylinder head.	6. Tighten exhaust manifold to cylinder head bolts. Replace gasket if necessary.
	7. Turbocharger mounting flange cracked.	7. Remove turbocharger and inspect. (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - REMOVAL).
	8. Restriction in exhaust system.	8. Remove restriction, if possible. Replace restricted part if necessary.

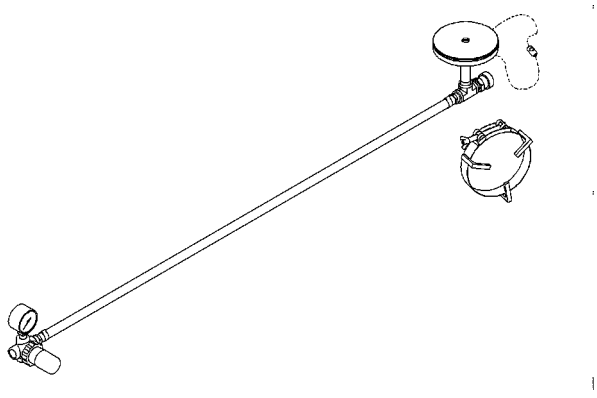
EXHAUST SYSTEM (Continued)

SPECIAL TOOLS



TURBOCHARGER TESTER 9022

CATALYTIC CONVERTER

DESCRIPTION - CATALYTIC CONVERTER

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

CAUTION: DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used to avoid contaminating the catalyst core.

50 State emission vehicles incorporate two mini catalytic converters located after the exhaust manifolds and before the inline catalytic converter.

OPERATION

The catalytic converter captures and burns any unburned fuel mixture exiting the combustion chambers during the exhaust stroke of the engine. This process aids in reducing emissions output.

REMOVAL

REMOVAL

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

(1) Raise and support the vehicle.
(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
(3) Remove the bolts from the crossover pipe to the catalytic converter connection.
(4) Disconnect oxygen sensor wiring.
(5) Loosen the nuts from the clamp that hold the catalytic converter to the exhaust pipe flange connection.

NOTE: Do not remove nut from T-Bolt. Only remove nut far enough, so that the T end can be removed from the clamp.

(6) Remove the T bolt end of the fastener, from the clamp.
(7) Spread the clamp, and remove the catalytic converter from the vehicle.
(8) Discard the clamp.

NOTE: The catalytic converter to exhaust manifold clamp is not reusable. Always use a new clamp when reinstalling the catalytic converter.

REMOVAL

(1) Raise and support vehicle.
(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
(3) Remove clamps and nuts.
(4) Remove the catalytic converter.

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

INSTALLATION

INSTALLATION

NOTE: The catalytic converter to exhaust manifold clamp is not reusable. Always use a new clamp when reinstalling the catalytic converter.

CATALYTIC CONVERTER (Continued)

(1) Position the catalytic converter onto the exhaust pipe flange connection. Tighten the nuts to 28 N·m (250 in. lbs.) torque.

(2) Install the muffler onto the catalytic converter until the alignment tab is inserted into the alignment slot.

(3) Install the exhaust clamp at the muffler and catalytic converter connection. Tighten the clamp nuts to 54.2 N·m (40 ft. lbs.) torque.

(4) Connect oxygen sensor wiring.

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.

(7) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

INSTALLATION

(1) Assemble converter and clamps loosely in place.

(2) Install the exhaust pipe onto exhaust manifolds, tighten 31 N·m (23 ft. lbs.).

(3) Tighten all clamp nuts to 52.2 N·m (40 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.

(6) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

EXHAUST PIPE

REMOVAL - 3.7L/4.7L/5.7L

(1) Raise and support the vehicle.

(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Remove exhaust pipe to manifold bolts, retainers and nuts.

(4) Remove the clamp nuts.

(5) Remove the exhaust pipe (Fig. 4).

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

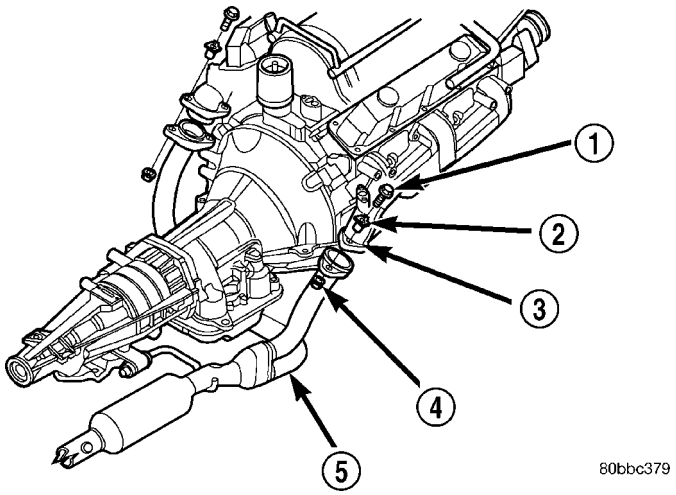


Fig. 4 Exhaust Pipe to Manifold Connection - Typical

1 - BOLT
2 - RETAINER
3 - EXHAUST MANIFOLD
4 - NUT
5 - EXHAUST PIPE

INSTALLATION - 3.7L/4.7L/5.7L

(1) Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.

(2) Position the exhaust pipe to manifold. Install the bolts, retainers and nuts. Tighten the nuts to 31 N·m (23 ft. lbs.) torque.

(3) Tighten the clamp nuts to 54.2 N·m (40 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST PIPE

REMOVAL - DIESEL

(1) Disconnect the battery negative cables.

(2) Raise and support the vehicle on a hoist.

(3) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

(4) Remove the exhaust pipe-to-extension pipe clamp. Separate the exhaust pipe and extension pipe.

(5) Remove the exhaust pipe-to-turbocharger elbow clamp (Fig. 5).

(6) Remove the exhaust pipe from the transmission support (Fig. 5).

EXHAUST PIPE (Continued)

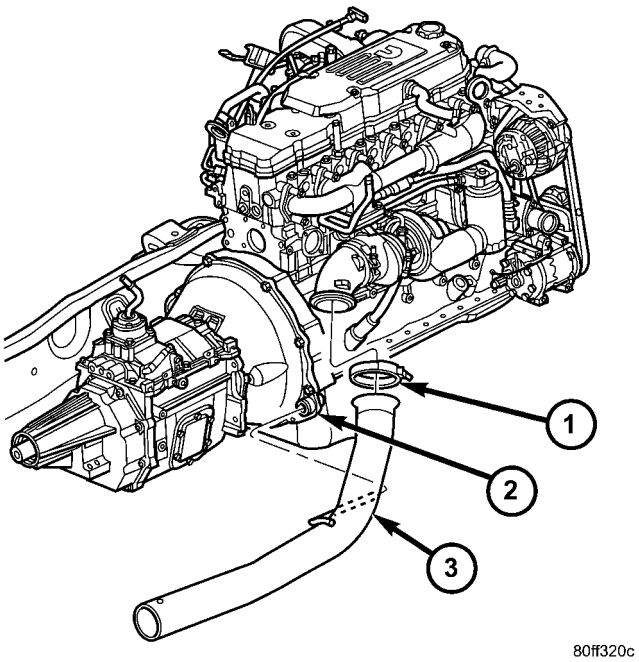

Fig. 5 Exhaust Pipe

1 - Clamp
2 - Support
3 - EXHAUST PIPE

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION - DIESEL

(1) Install the exhaust pipe into the transmission support and onto the turbocharger flange.

(2) Install the exhaust pipe-to-turbocharger elbow clamp and tighten to 11 N·m (100 in. lbs.) torque.

(3) Install the extension pipe and clamp to the exhaust pipe using a new clamp and tighten the clamp nuts to 54.2 N·m (40 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Connect the battery negative cables.

(6) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.

(7) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

HEAT SHIELDS

DESCRIPTION

There are two types of heat shields used. One is stamped steel the other is molded foil sheets. The shields attach to the vehicle around the exhaust system to prevent heat from the exhaust system from entering the passenger area and other areas where the heat can cause damage to other components.

REMOVAL

(1) Raise and support the vehicle.

(2) Remove the nuts or bolts holding the exhaust heat shield to the floor pan (Fig. 6) (Fig. 7) (Fig. 8), crossmember or bracket.

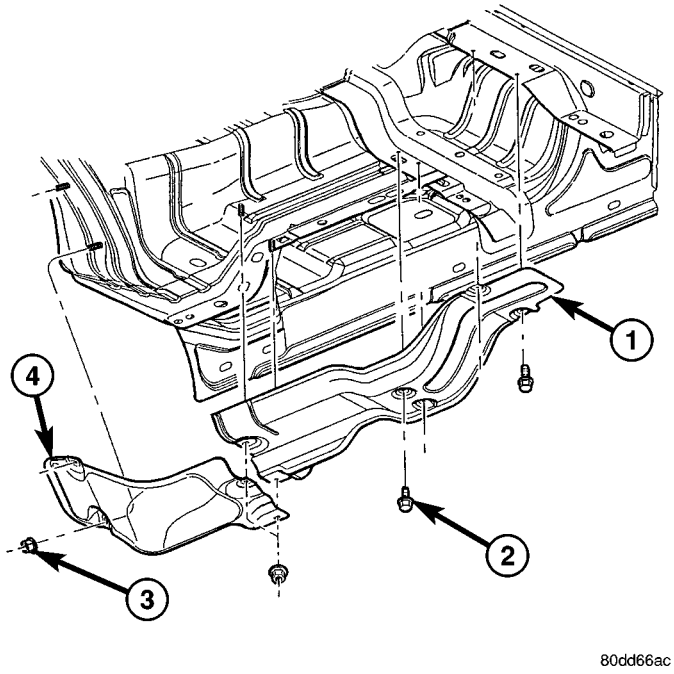

Fig. 6 HEAT SHIELDS - RH - REG CAB

1 - HEAT SHIELD
2 - FASTENER
3 - NUT
4 - HEAT SHIELD

(3) Slide the shield out around the exhaust system.

INSTALLATION

(1) Position the exhaust heat shield to the floor pan, crossmember or bracket and install the nuts or bolts.

(2) Tighten the nuts and bolts 11 N·m (100 in. lbs.).

(3) Lower the vehicle.

HEAT SHIELDS (Continued)

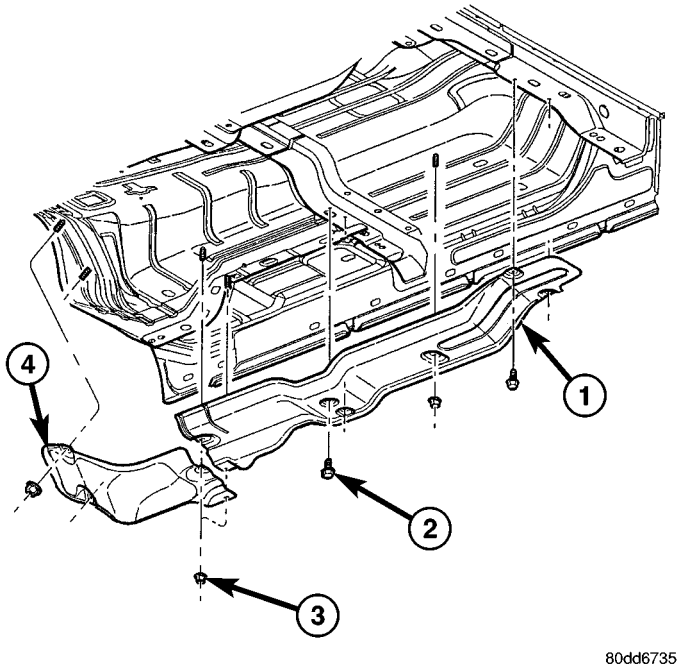

Fig. 7 HEAT SHIELDS - RH - QUAD CAB

1 - HEAT SHIELD
2 - NUT

MUFFLER

REMOVAL

(1) Raise and support the vehicle.
(2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
(3) Disconnect the muffler hangers (Fig. 9).

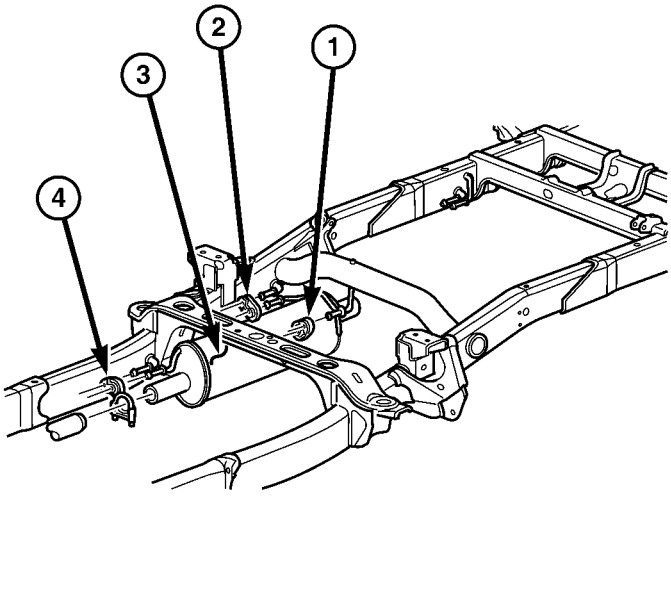

Fig. 9 MUFFLER

1 - INSULATOR
2 - INSULATOR
3 - MUFFLER
4 - INSULATOR

(4) Remove clamps and nuts.
(5) Remove the muffler.

INSTALLATION

(1) Assemble muffler and clamps loosely to permit proper alignment of all parts.
(2) Connect the muffler hangers.
(3) Tighten the clamp nuts to 54.2 N·m (40 ft. lbs.) torque.
(4) Lower the vehicle.
(5) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.
(6) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

MUFFLER - 5.9L DIESEL

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise and support the vehicle.
(3) Remove the muffler to tail pipe and extension pipe clamps (Fig. 10).
(4) Disconnect the muffler from the hanger isolators (Fig. 10).
(5) Disconnect the muffler from the tailpipe.
(6) Disconnect the muffler from the extension pipe and remove from the vehicle.

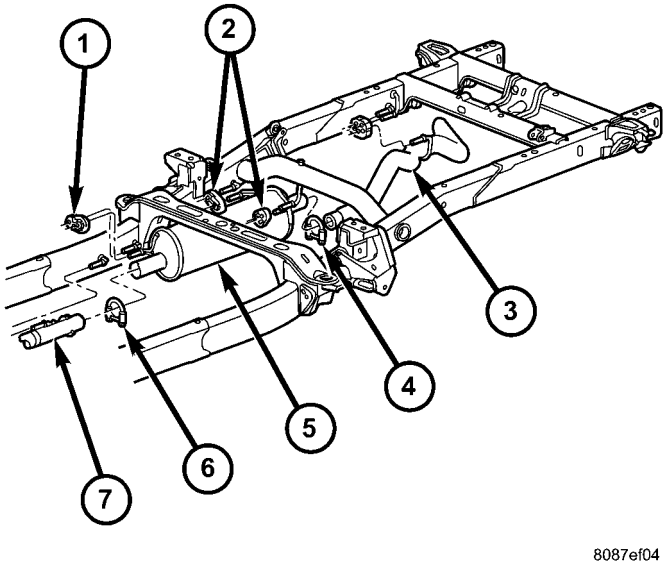

Fig. 10 Muffler Removal/Installation

1 - INSULATOR
2 - ISOLATOR
3 - TAILPIPE
4 - CLAMP
5 - MUFFLER
6 - CLAMP
7 - EXTENSION PIPE

INSTALLATION

(1) Install the muffler hanger rods into the isolators (Fig. 10).
(2) Install the muffler into the extension pipe.
(3) Install the muffler into the tail pipe.
(4) Install the exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 54.2 N·m (40 ft. lbs.) torque.
(5) Lower the vehicle.
(6) Connect the battery negative cables.
(7) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.
(8) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

TAILPIPE - 5.9L DIESEL

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise and support the vehicle.
(3) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
(4) Disconnect the exhaust tailpipe support hanger isolators (Fig. 11).
(5) Remove the muffler-to-tailpipe clamps (Fig. 11).
(6) Remove the tailpipe from the vehicle.

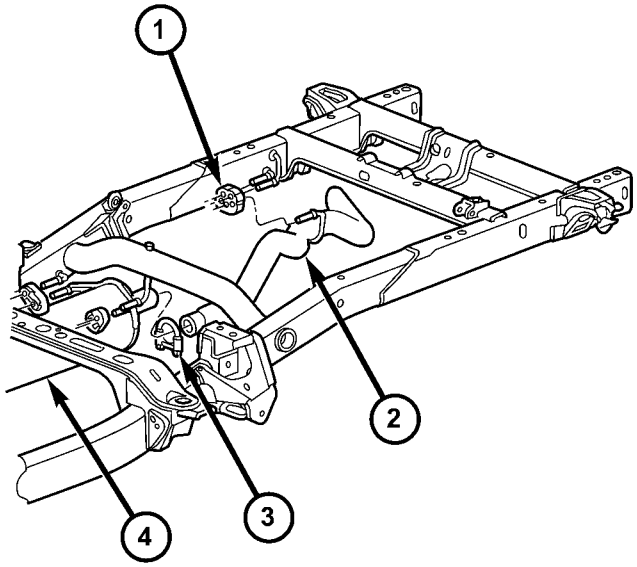

Fig. 11 Tailpipe Removal/Installation

1 - ISOLATOR
2 - TAILPIPRE
3 - CLAMP
4 - MUFFLER

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

TAILPIPE - 5.9L DIESEL (Continued)

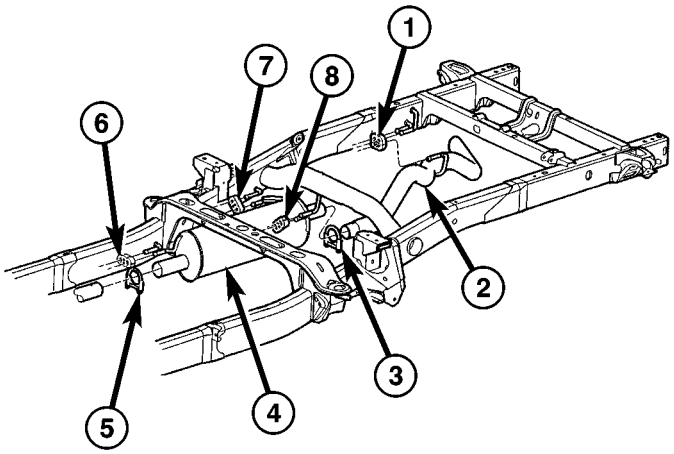
INSTALLATION

(1) Install the tailpipe into the muffler.
(2) Install the tailpipe hanger rods into the isolators (Fig. 11)
(3) Install the exhaust clamp, align the exhaust system, and tighten the clamp 48 N·m (35 ft. lbs.) torque.
(4) Lower the vehicle.
(5) Connect the battery negative cables.
(6) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.
(7) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

TAILPIPE

REMOVAL

(1) Raise and support the vehicle.
(2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
(3) Disconnect the exhaust tailpipe support hanger (Fig. 12).



80dd531a

Fig. 12 TAILPIPE

4 - MUFFLER
5 - CLAMP
6 - INSULATOR
7 - INSULATOR
8 - INSULATOR

(4) Remove clamps and nuts.
(5) Remove the exhaust tailpipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

(1) Loosely assemble exhaust tailpipe to permit proper alignment of all parts.
(2) Connect the support hangers.
(3) Position the exhaust tailpipe for proper clearance with the underbody parts.
(4) Tighten all clamp nuts to 54.2 N·m (40 ft. lbs.) torque.
(5) Lower the vehicle.
(6) Start the engine and inspect for exhaust leaks. Reair exhaust leaks as necessary.
(7) Check the exhaust system for contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Make the necessary adjustments, if needed..

TURBOCHARGER SYSTEM

DIAGNOSIS AND TESTING - TURBOCHARGER BOOST PRESSURE

NOTE: This diagnostic procedure is to be used with the DRB III® while test driving the vehicle under normal load and driving conditions.

Low turbocharger boost pressure can cause poor engine performance and driveability concerns. The following procedure will test the turbocharger boost pressure.

(1) Loosen clamps holding air inlet duct rubber sleeve to the intake manifold and air inlet duct. Remove rubber sleeve (Fig. 13).
(2) Position Special Tool 8462 onto air inlet duct and intake manifold. Using the existing clamps tighten to 8 N·m (72 in. lbs.).
(3) Install the 3447.5 kPa 500 psi (gray) Pressure Transducer (part of OT-CH8520 Transducer Kit) into Special Tool 8462.
(4) Connect the DRB III® to the pressure transducer following the instructions supplied with the DRB III®.
(5) Enter DRB III® into pressure reading mode and test drive vehicle.

TURBOCHARGER SYSTEM (Continued)

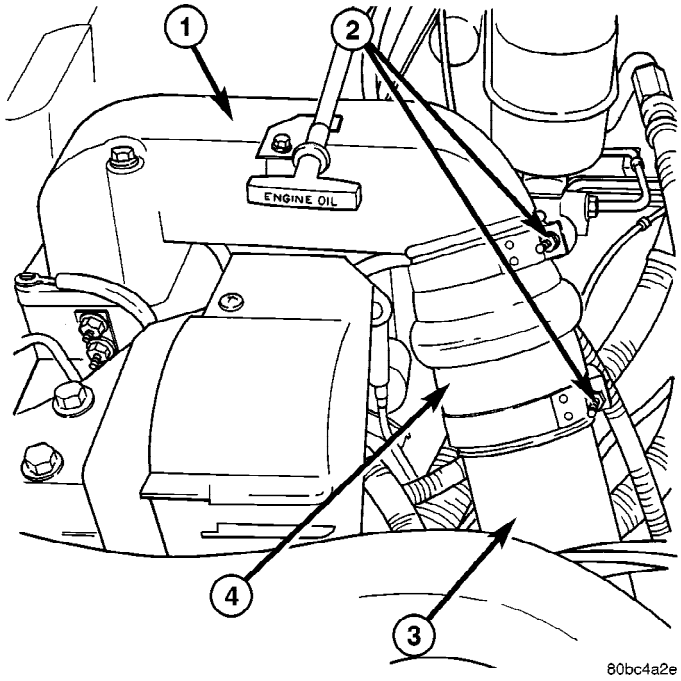

Fig. 13 INTAKE MANIFOLD TO AIR INLET DUCT RUBBER SLEEVE

1 - INTAKE MANIFOLD AIR INLET
2 - CLAMPS
3 - AIR INLET DUCT
4 - AIR INLET DUCT RUBBER SLEEVE

(6) Full load boost pressure at rated speed will be 158 - 186 kPa (23 - 27 psi.) depending on engine hp rating.. If pressure readings are are not within this range inspect for the following:

- Restricted air inlet system
- Leak in the charge air cooler system (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/ CHARGE AIR COOLER AND PLUMBING - DIAGNOSIS AND TESTING)
- Turbocharger wastegate broken or misadjusted
- Restricted/high pressure drop across charge air cooler
- Turbocharger damaged (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION)

TURBOCHARGER

DESCRIPTION

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (4) major component systems (Fig. 14) (Fig. 15) :

- Turbine section
- Compressor section
- Bearing housing
- Wastegate

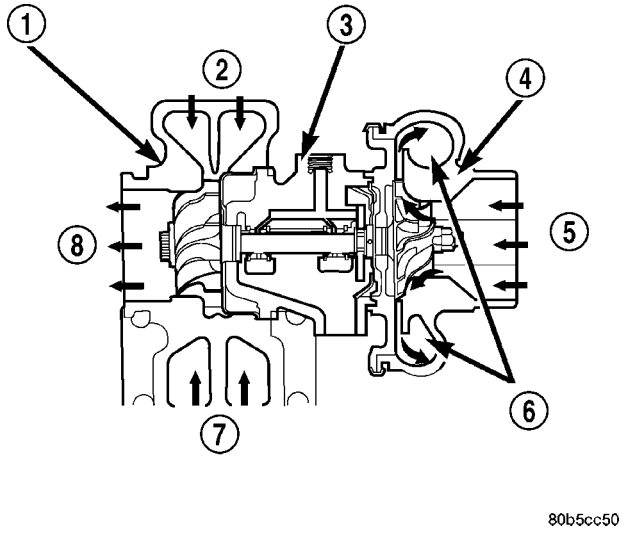

Fig. 14 Turbocharger Operation

1 - TURBINE SECTION
2 - EXHAUST GAS

8 - EXHAUST GAS TO EXHAUST PIPE

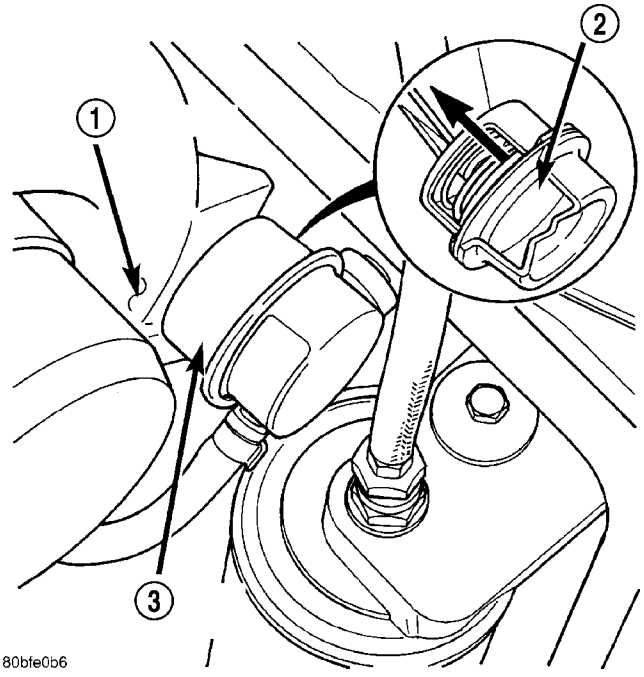

Fig. 15 Turbocharger Wastegate Actuator

1 - TURBOCHARGER
2 - DIAPHRAGM
3 - WASTE GATE ACTUATOR

TURBOCHARGER (Continued)

OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:

- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

The turbocharger also uses a wastegate (Fig. 16), which regulates intake manifold air pressure and prevents over boosting at high engine speeds. When the wastegate valve is closed, all of the exhaust gases flow through the turbine wheel. As the intake manifold pressure increases, the wastegate actuator opens the valve, diverting some of the exhaust gases away from the turbine wheel. This limits turbine shaft speed and air output from the impeller.

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line that is tapped into the oil filter head. The oil travels into the bearing housing, where it lubricates the shaft and bearings (Fig. 17). A return pipe at the bottom of the bearing housing, routes the engine oil back to the crankcase.

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate “cool-down” periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

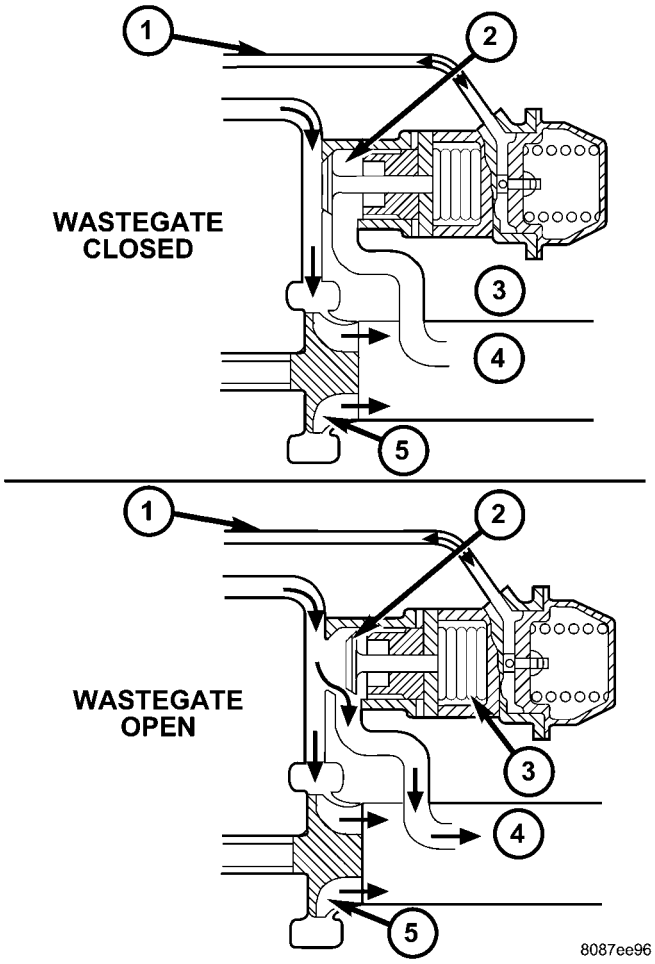

Fig. 16 Wastegate Operation

Stop & Go	Medium	Warm	1
Highway Speeds	Medium	Warm	2
City Traffic	Max. GCWR	Warm	3
Highway Speeds	Max. GCWR	Warm	4
Uphill Grade	Max. GCWR	Hot	5

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Disconnect the exhaust pipe from the turbocharger elbow(Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL).

(4) Remove the bolts from the turbocharger oil drain tube.

(5) Lower vehicle.

(6) Disconnect the turbocharger air inlet hose (Fig. 18).

(7) Disconnect the turbocharger oil supply line from the turbocharger (Fig. 19).

(8) Disconnect the charge air cooler inlet pipe from the turbocharger compressor outlet (Fig. 19).

6 - OIL DRAIN LINE

TURBOCHARGER (Continued)

(9) Remove the turbocharger and gasket from the exhaust manifold.

(10) If the turbocharger is not to be installed immediately, cover the opening to prevent material from entering into the manifold.

(11) If replacing the turbocharger, transfer the turbocharger oil supply fitting to the new assembly. Tighten fitting to 36 N·m (27 ft. lbs.).

(12) Clean and inspect the sealing surface.

CAUTION: The turbocharger is only serviced as an assembly. Do not attempt to repair the turbocharger as turbocharger and/or engine damage can result.

CLEANING

WARNING: To prevent damage or personal injury, do not use a combustable cleaner to clean the turbocharger.

Clean the turbocharger and exhaust manifold mounting surfaces with a suitable scraper.

INSPECTION

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

(1) Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:

- Cracks in the turbine and compressor housing that go completely through.
- Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
- Cracks in the mounting flange that intersect bolt through-holes.
- Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.

(2) Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips. Note: Some impellers may have a factory placed paint mark which, after normal operation, appears to be a crack. Remove this mark with a suitable solvent to verify that it is not a crack.

(3) Visually inspect the turbocharger compressor housing for an impeller rubbing condition (Fig. 20). Replace the turbocharger if the condition exists.

(4) Measure the turbocharger axial end play:

(a) Install a dial indicator as shown in (Fig. 21). Zero the indicator at one end of travel.

(b) Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.026 mm (0.0001 in.) MIN. and 0.127 mm (0.005 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

(5) Measure the turbocharger bearing radial clearance:

(a) Insert a narrow blade or wire style feeler gauge between the compressor wheel and the housing (Fig. 22).

(b) Gently push the compressor wheel toward the housing and record the clearance.

(c) With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.

(d) Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.

(e) Allowable radial bearing clearance is 0.33 mm (0.013 in.) MIN. and 0.50 mm (0.020 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assembly.

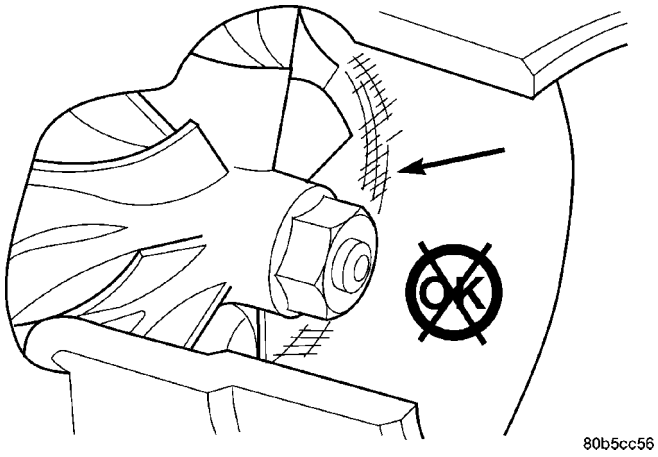

Fig. 20 Inspect Compressor Housing for Impeller Rubbing Condition

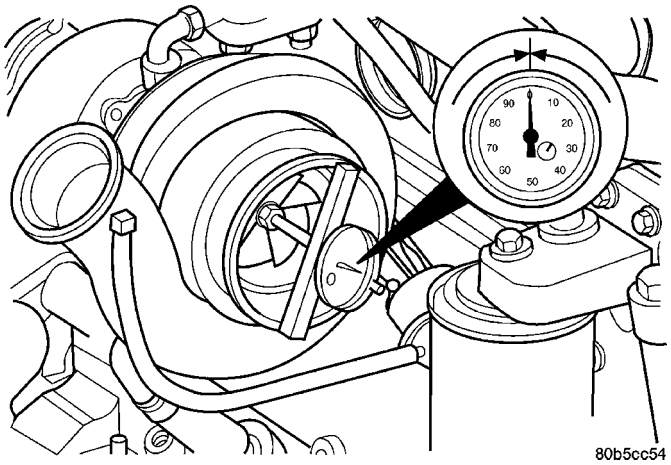

Fig. 21 Measure Turbocharger Axial End Play

INSTALLATION

(1) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 43 N·m (32 ft. lbs.) torque.

TURBOCHARGER (Continued)

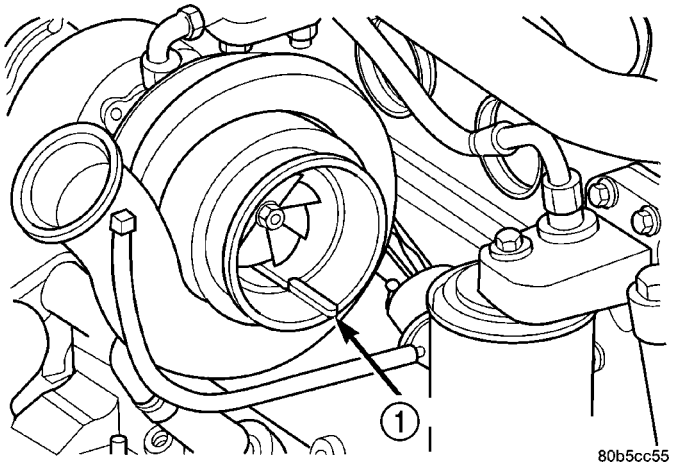

Fig. 22 Measure Turbocharger Bearing Radial Clearance

1 - FEELER GAUGE

(2) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Carefully rotate the turbocharger impeller by hand to distribute the oil thoroughly.

(3) Install and tighten the oil supply line to 24 N·m (18 ft. lbs.) torque.

(4) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 11 N·m (95 in. lbs.) torque.

(5) Position the air inlet hose to the turbocharger (Fig. 18). Tighten the clamp to 11 N·m (95 in. lbs.) torque.

(6) Raise vehicle on hoist.

(7) Using a new gasket, install the oil drain tube to the turbocharger (Fig. 19). Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

(8) Tighten the oil drain tube clamps to 8 N·m (71 in. lbs.).

(9) Connect the exhaust pipe to the turbocharger and tighten the bolts to 11.3 N·m (100 in. lbs.) torque.

(10) Lower the vehicle.

(11) Connect the battery negative cables.

(12) Start the engine to check for leaks.

CHARGE AIR COOLER AND PLUMBING

DESCRIPTION

The charge air system (Fig. 23) consists of the charge air cooler piping, charge air cooler and intake air grid heater.

The charge air cooler is a heat exchanger that uses air flow from vehicle motion to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases engine efficiency and power.

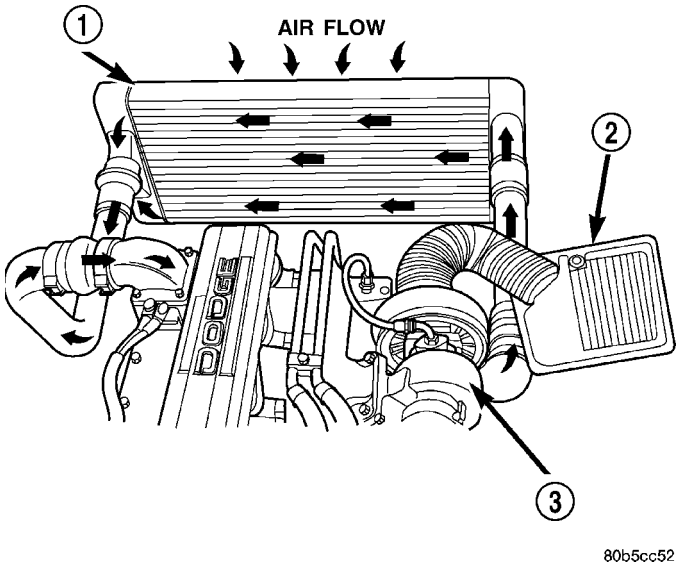

Fig. 23 Intake Air Circulation

1 - CHARGE AIR COOLER
2 - AIRFILTER
3 - TURBOCHARGER

OPERATION

Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in front of the radiator. From the charge air cooler the air flows back into the intake manifold.

DIAGNOSIS AND TESTING - CHARGE AIR COOLER SYSTEM - LEAKS

Low turbocharger boost pressure and low engine performance can be caused by leaks in the charge air cooler or plumbing. Fuel staining on the exhaust manifold can also be an indication that there are leaks in the air system.The following procedure outlines how to check for leaks in the charge air cooler system.

(1) Loosen clamp and remove air inlet hose from turbocharger.

(2) Insert Special Tool 9022 Adapter into the turbocharger inlet. Tighten tool clamp to 8 N·m (72 in. lbs.).

CHARGE AIR COOLER AND PLUMBING (Continued)

CAUTION: Do not apply more than 138 kPa (20 psi) air pressure to the charge air cooler system, sever damage to the charge air cooler system may occur.

(3) Connect a regulated air supply to air fitting on Tool 9022 Adapter. Set air pressure to a Maximum of 138 kPa (20 psi).

(4) Using soapy water check the rubber sleeves, charge air cooler and intake manifold for leaks.

REMOVAL

WARNING: IF THE ENGINE WAS JUST TURNED OFF, THE AIR INTAKE SYSTEM TUBES MAY BE HOT.

(1) Disconnect the battery negative cables.

(2) Discharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) and remove the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL) (if A/C equipped).

(3) Remove the transmission auxiliary cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

(4) Remove the boost tubes from the charge air cooler (Fig. 24).

(5) Remove the charge air cooler bolts. Pivot the charge air cooler forward and up to remove.

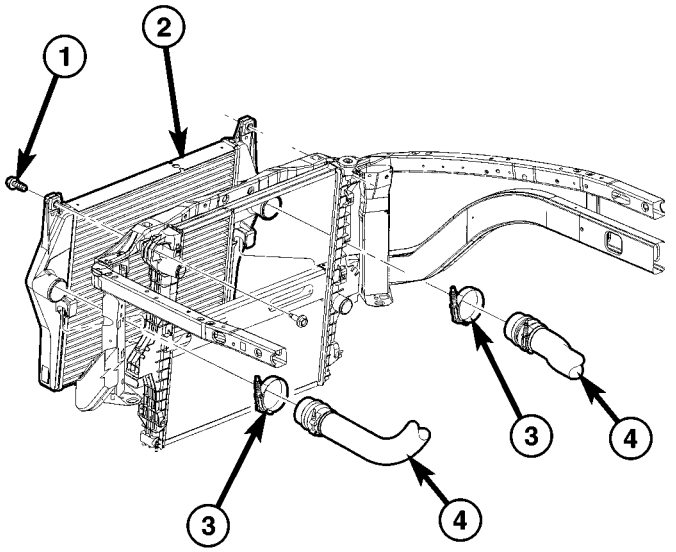

Fig. 24 Air Intake System Tubes

1 - BOLT
2 - CHARGE AIR COOLER
3 - CLAMP
4 - BOOST TUBE

CLEANING

CAUTION: Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

NOTE: If internal debris cannot be removed from the cooler, the charge air cooler MUST be replaced.

(1) If the engine experiences a turbocharger failure or any other situation where oil or debris get into the charge air cooler, the charge air cooler must be cleaned internally.

(2) Position the charge air cooler so the inlet and outlet tubes are vertical.

(3) Flush the cooler internally with solvent in the direction opposite of normal air flow.

(4) Shake the cooler and lightly tap on the end tanks with a rubber mallet to dislodge trapped debris.

(5) Continue flushing until all debris or oil are removed.

(6) Rinse the cooler with hot soapy water to remove any remaining solvent.

(7) Rinse thoroughly with clean water and blow dry with compressed air.

INSPECTION

Visually inspect the charge air cooler for cracks, holes, or damage. Inspect the tubes, fins, and welds for tears, breaks, or other damage. Replace the charge air cooler if damage is found.

Pressure test the charge air cooler, using Charge Air Cooler Tester Kit #3824556. This kit is available through Cummins® Service Products. Instructions are provided with the kit.

INSTALLATION

(1) Position the charge air cooler. Install the bolts and tighten to 2 N·m (17 in. lbs.) torque.

(2) Install the air intake system tubes to the charge air cooler. With the clamps in position, tighten the clamps to 11 N·m (95 in. lbs.) torque.

(3) Install the transmission auxiliary cooler (if equipped) (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(4) Install the A/C condenser (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION). Recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(5) Connect the battery negative cables.

(6) Start engine and check for boost system leaks.

BUMPERS

SPECIFICATIONS - TORQUE

TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Front bumper center bracket nuts	95	70	—
Front bumper stud plate nuts	95	70	—
License plate hitch reinforcement bolts	54	40	—
Rear bumper support bracket stud plate nuts	54	40	—
Rear bumper support bracket to hitch bolts	54	40	—
Rear bumper to hitch bolts	54	40	—

FRONT AIR DAM

REMOVAL

(1) Remove the two outboard screws.
(2) Remove the three middle screws and remove the air dam.

INSTALLATION

(1) Position the air dam onto the bumper and seat the carrot type fasteners fully.
(2) Starting at the center screw install the three middle screws.
(3) Install the two outboard screws.

FRONT BUMPER

REMOVAL

(1) Using a grease pencil or equivalent, mark the position of the bumper on the frame rail tip to aid installation.
(2) Disconnect the fog lamp electrical connector at the left frame rail.
(3) Support the bumper with a suitable lifting device.
(4) Remove the center bracket nuts and bolts and remove bumper. (Fig. 1)

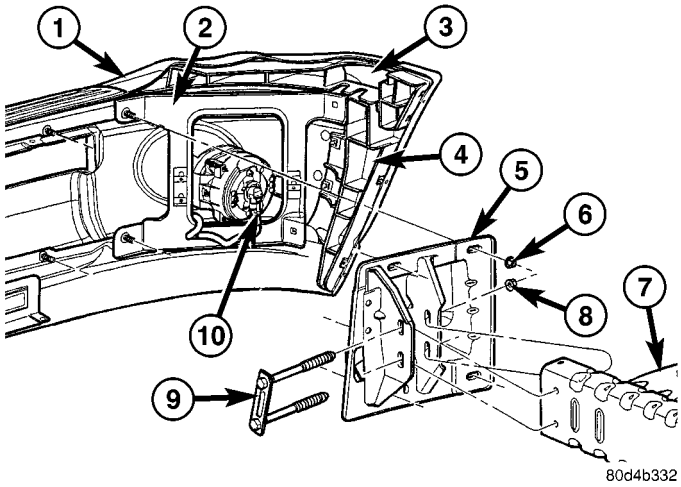

Fig. 1 BUMPER SUPPORT BRACKET - TYPICAL

1 - FASCIA - SPORT MODEL
2 - SUPPORT BRACKET
3 - FASCIA SUPPORT BRACKET
4 - WHEELHOUSE SPLASH SHIELD SUPPORT BRACKET
5 - BUMPER CENTER BRACKET
6 - NUTS (4 PER SIDE)
7 - FRAME RAIL TIP
8 - CENTER BRACKET NUTS (2 PER SIDE)
9 - CENTER BRACKET BOLTS ASSEMBLY (1 PER SIDE)
10 - FOG LAMP

INSTALLATION

(1) Install the bumper onto the frame rails and position the wheelhouse splash shield into the support brackets.
(2) Install the bolts and nuts.
(3) Line up the bumper with the marks made previously and tighten the bolts and nuts to 95 N·m (70 ft. lbs.).
(4) Check and adjust the bumper alignment as necessary. (Refer to 23 - BODY/BODY STRUCTURE/ GAP AND FLUSH - SPECIFICATIONS)

FRONT FASCIA

REMOVAL

ST/SLT/SLT+ - FASCIA REMOVAL

(1) Remove the two screws at each trailing edge of the fascia. (Fig. 2)
(2) Remove the four push pin fasteners from the upper edge of the close out panel.
(3) Using a trim stick C-4755 or equivalent, carefully release the six lower clips and remove the close out panel.
(4) Using a trim stick C-4755 or equivalent, carefully remove the step pad.
(5) Remove and discard the four push pin fasteners and remove the fascia.

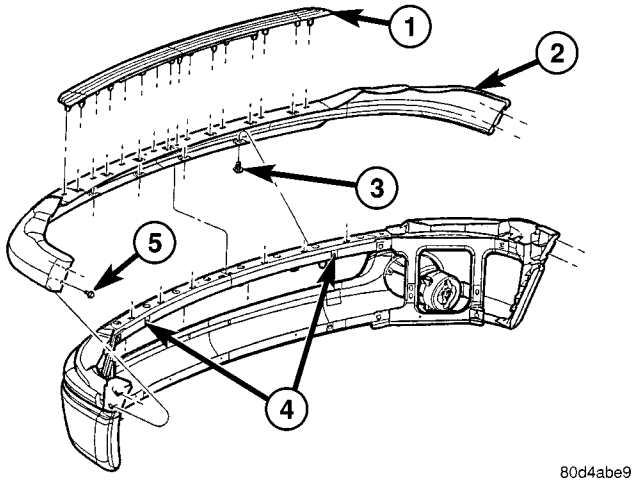

Fig. 2 UPPER FASCIA - ST/SLT/SLT+

1 - STEP PAD
2 - UPPER FASCIA (ST/SLT/SLT+ MODEL ONLY)
3 - INBOARD BUMPER BRACKET ATTACHMENTS
4 - SCREWS (4)
5 - PUSH PIN FASTENERS (4)

FRONT FASCIA (Continued)

SPORT FASCIA REMOVAL

(1) Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the three screws at each trailing edge of the fascia. (Fig. 3)

(3) Remove the five lower screws.

(4) Remove and discard the four upper push pins.

(5) Using a trim stick C-4755 or equivalent, carefully release the six lower clips and remove the close out panel.

(6) Using a trim stick C-4755 or equivalent, carefully remove the step pad.

(7) Spread the fascia out at the wheels and remove from the vehicle.

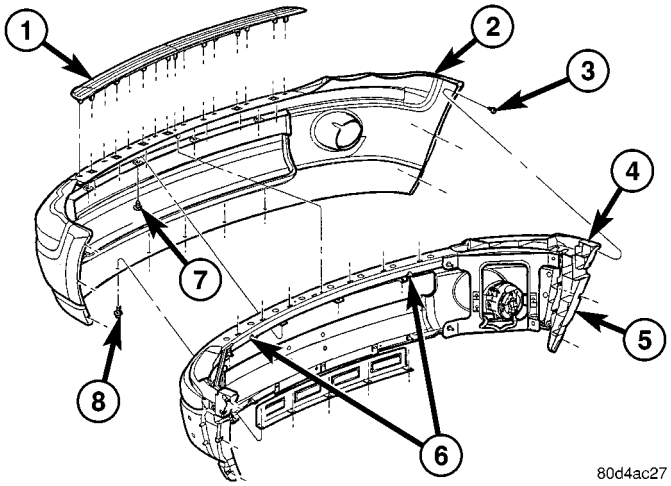

Fig. 3 SPORT FASCIA

1 - STEP PAD
2 - FASCIA (SPORT MODEL ONLY)
3 - SCREWS (3 PER SIDE)
4 - UPPER FASCIA SUPPORT BRACKET
5 - WHEELHOUSE SPLASH SHIELD BRACKET
6 - INBOARD BUMPER BRACKET ATTACHMENTS
7 - PUSH PIN FASTENERS (4)
8 - LOWER SCREWS (5)

INSTALLATION

NOTE: The left and right inboard bumper to bracket attachments must be secured before installing the fascia and step pad.

ST/SLT/SLT+ FASCIA INSTALLATION

(1) Install the fascia.

(2) Position the close out panel and seat the 6 lower clips fully.

(3) Install four new upper push pin fasteners.

(4) Position the step pad onto the fascia and fully seat the attachment clips.

(5) Align the fascia to the fender with a 19 mm (0.75 inch) gap and install the two screws at each trailing edge of the fascia.

SPORT FASCIA INSTALLATION

(1) Position the fascia onto the bumper.

(2) Position the step pad onto the fascia and fully seat the attachment clips.

(3) Install four new upper push pin fasteners.

(4) Install the five lower screws.

(5) Install the three screws at each trailing edge of the fascia.

REAR BUMPER

REMOVAL

(1) Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the license plate.

(3) Remove the bolts behind the plate.

(4) Disconnect the license plate light electrical connectors.

(5) Disconnect the trailer light connector electrical connection, if equipped.

(6) Remove the two bolts along the front upper edge of the bumper near the frame tips.

(7) Support the bumper with a suitable lifting device.

(8) Remove the bolts attaching the bumper support brackets to the trailer hitch. (Fig. 4)

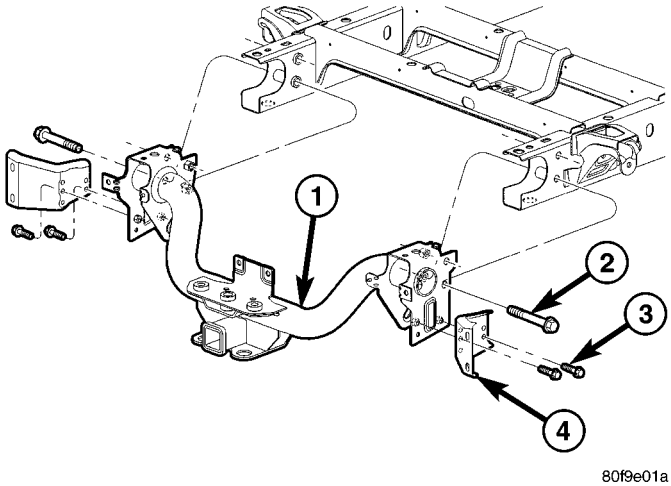

Fig. 4 TRAILER HITCH

1 - HITCH
2 - LD HITCH BOLTS (4)/HD (6)
3 - BUMPER BRACKET BOLTS (4)
4 - BUMPER SUPPORT BRACKETS

REAR BUMPER (Continued)

INSTALLATION

(1) Align the holes in the bumpers to the trailer hitch pins and install the bumper.
(2) Install the support bracket to the hitch bolts, loosely.
(3) Install the front upper edge to the trailer hitch bolts and tighten to 54 N·m (40 ft. lbs.).
(4) Install the license plate reinforcement to hitch bolts and tighten to 54 N·m (40 ft. lbs.).
(5) Tighten the left bumper bracket bolts to 54 N·m (40 ft. lbs.).
(6) Tighten the right bumper bracket bolts to 54 N·m (40 ft. lbs.).
(7) Connect the trailer light connector electrical connection, if equipped.
(8) Connect the license plate light electrical connectors.
(9) Install the license plate.

FRAME

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE EYE PROTECTION WHEN GRINDING OR WELDING METAL, SERIOUS EYE INJURY CAN RESULT.

- **BEFORE PROCEEDING WITH FRAME REPAIR INVOLVING GRINDING OR WELDING, VERIFY THAT VEHICLE FUEL SYSTEM IS NOT LEAKING OR IN CONTACT WITH REPAIR AREA, PERSONAL INJURY CAN RESULT.**
- **DO NOT ALLOW OPEN FLAME OR HEAT AND METAL SPATTER FROM ARC WELDING, TO CONTACT PLASTIC BODY PANELS. FIRE OR EXPLOSION CAN RESULT.**
- **WHEN WELDED FRAME COMPONENTS ARE REPLACED, ENSURE COMPLETE PENETRATION WELD IS ACHIEVED DURING INSTALLATION. IF NOT, DANGEROUS OPERATING CONDITIONS CAN RESULT.**
- **STAND CLEAR OF CABLES OR CHAINS ON PULLING EQUIPMENT DURING FRAME STRAIGHTENING OPERATIONS, PERSONAL INJURY CAN RESULT.**
- **DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT SUPPORTED ON SAFETY STANDS, PERSONAL INJURY CAN RESULT.**

CAUTION: 1500 series Dodge Ram Trucks (2002 and later) are not designed for snow plow equipment. The front collision repair tips must not be installed on any truck equipped with a snow plow, or even intended to be equipped with a snow plow.

CAUTION: Do not reuse damaged fasteners, quality of repair would be suspect. Failure to use only production fasteners or fasteners of equivalent hardness can result in loosening or failure. Do not drill any holes in the frame that are not specifically outlined in this or other, DaimlerChrysler procedure as frame rail failure can result. When using heat to straighten frame components do not exceed 566°C (1050°F), metal fatigue can result.

STANDARD PROCEDURE

STANDARD PROCEDURE - LIGHT DUTY FRONT FRAME RAIL TIP REPLACEMENT

CAUTION: This procedure is designed to replace the front frame rail tips that have been damaged in the crush initiator zones. Prior to any cutting, the vehicle must be mounted on the appropriate frame repair equipment ("frame rack"), checked with three dimensional measuring equipment, and the necessary pull corrections made. If damage remains in the frame beyond the area covered by this service part after the pull, the frame must be replaced in its entirety.

NOTE: Procedures for 4X2 and 4X4 are common except as noted in this procedure.

(1) Before proceding with this repair procedure review the required service warnings and precautions. (Refer to 13 - FRAME & BUMPERS/FRAME - WARNING)
(2) Disconnect and isolate the battery negative cable.
(3) Remove the front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL)
(4) Remove the bolts and position aside the wire harness and grounds, if required.
(5) Remove the front bumper. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL)
(6) Loosen and lower the stabilizer bar mount and bar. (Refer to 2 - SUSPENSION/FRONT/STABILIZER BAR - REMOVAL)

FRAME (Continued)

(7) Remove the front cab mount bolt to the Front End Sheet Metal (FESM) bracket. (Fig. 5)

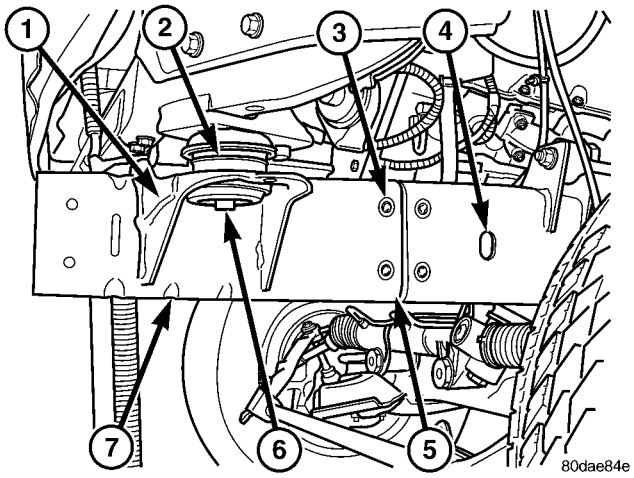

Fig. 5 REPLACEMENT FRAME TIP

1 - FRONT END SHEET METAL (FESM) BRACKET
2 - CAB INSULATOR
3 - RING-FILLET WELD/HOLE
4 - PRINCIPLE LOCATING POINT (PLP)
5 - WELD ROOT GAP 4 mm - 6 mm (0.16 in. - 0.24 in.)
6 - FRONT CAB MOUNT BOLT
7 - REPLACEMENT FRAME TIP

(8) Make a vertical mark on the inside and outside face of the frame rail 112 mm (4.5 in.) from the forward edge of the PLP hole in the sides of the rail. (Fig. 7)

(9) Using a straightedge, connect the two lines on the top and bottom of the rail.

(10) Using the service tip as a guide, re-check your cut lines to ensure the service tip will fit when the cut is made.

CAUTION: Do not use any flame or plasma cutting equipment to cut the frame in this procedure. This is due to the inaccurate nature of the cut-line and the fact that the high temperatures achieved during flame or plasma cutting will change the metal characteristics and may weaken the frame and/or repair location.

(11) Using a reciprocating saw or equivalent, carefully cut and remove the damaged frame rail tip. (Fig. 6)

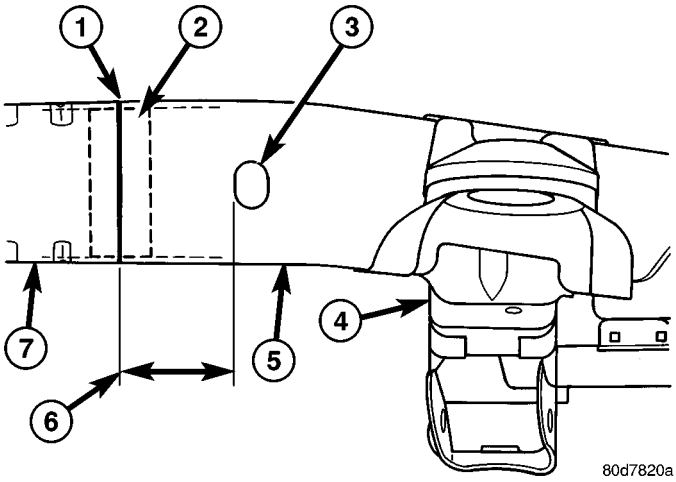

Fig. 6 FRAME CUT LOCATION

1 - REPAIR ROOT OPENING
2 - SERVICE SLEEVE
3 - PRINCIPLE LOCATING POINT (PLP)
4 - SUSPENSION BRACKETS
5 - FRAME
6 - FRAME CUTOFF LOCATION - 112 mm (4.5 in.)
7 - FRAME SERVICE TIP

(12) Assemble the service sleeve. Refer to SERVICE SLEEVE ASSEMBLY at the end of this procedure.

NOTE: Any burned surface coatings will need to be removed from the sleeve prior to installation and application of corrosion preventative coatings.

(13) Smooth and square the cut edges of the original frame. (Fig. 6)

FRAME (Continued)

(14) Dress the cut edge of the existing frame in preparation for the new rail tip.

(a) Drill four 13 mm (0.5 in.) diameter holes in the new tip and four more in the existing frame to accommodate ring-fillet welds. Center these holes 19 mm (0.75 in.) from the cut face of the rail and 38 mm (1.5 in.) from the top and bottom of the rail. (Fig. 7)

(b) Bevel the edges of the new tip, existing frame, and ring-fillet holes 25° - 30°. Scribing a line 2 mm from the cut edge and then grinding back to the mark will simplify the bevel creation process and accuracy. (Fig. 8)

(c) Remove any burrs at the holes and beveled edges.

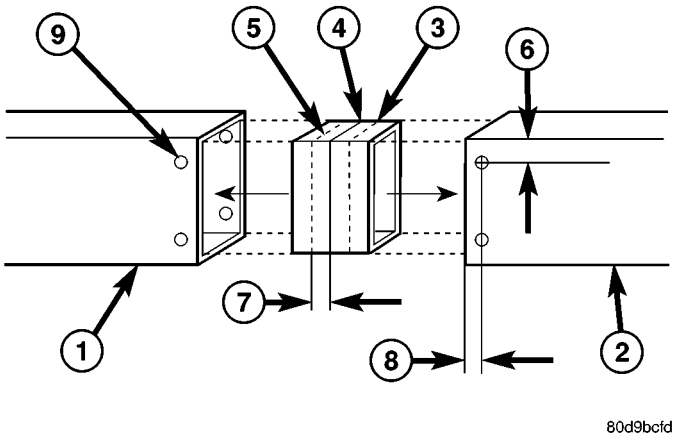

Fig. 7 REPAIR SLEEVE INSTALLATION (TYPICAL)

1 - REPLACEMENT FRAME TIP
2 - FRAME RAIL
3 - SERVICE SLEEVE
4 - CENTER LINE
5 - LOCATOR LINES (2)
6 - HORIZONTAL WELD HOLE LOCATION - 38 mm (1.5 in.)(BOTH FRAME SECTIONS)
7 - LOCATOR LINE DIMENSION - 2 mm (0.08 in.)
8 - VERTICAL WELD HOLE LOCATION - 19 mm (0.75 in.)(BOTH FRAME SECTIONS)
9 - RING FILLET WELD HOLES

(15) Dry fit the new rail to ensure alignment and fit and make any adjustments as necessary.

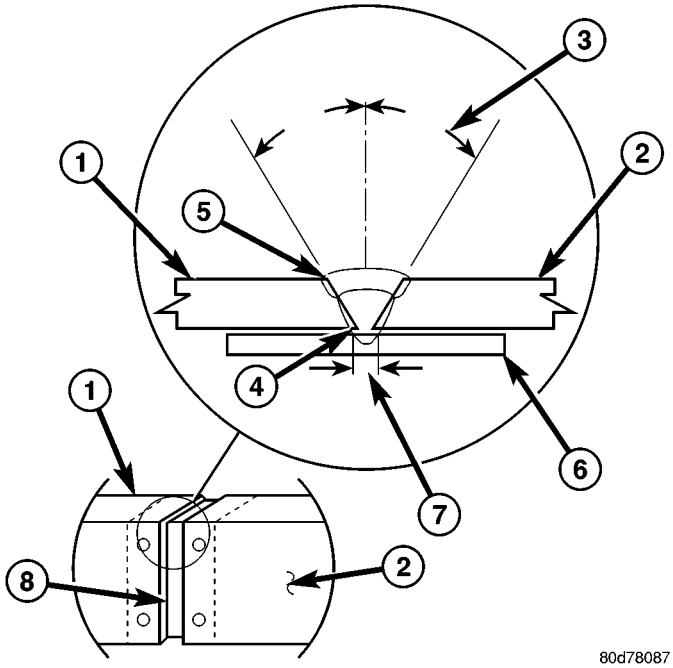

Fig. 8 WELD DIMENSIONS

1 - FRAME REPLACEMENT TIP
2 - FRAME RAIL
3 - FRAME DRESS ANGLE 25°-30°
4 - ROOT PASS
5 - COVER PASS
6 - SERVICE SLEEVE
7 - WELD ROOT GAP 4 mm - 6 mm (0.16 in. - 0.24 in.)
8 - SERVICE SLEEVE

(16) Remove all internal and external OEM e-coat within 51 mm (2.0 in.) of the weld joint on the replacement tip and the existing frame rail.

NOTE: Any burned surface coatings will need to be removed prior to application of corrosion preventative coatings.

CAUTION: Shield the surrounding area and components from exposure to the welding spatter and heat.

FRAME (Continued)

(17) On 4X4 models use the service sleeve as a template to drill a hole in the frame tip to accommodate the sway bar mounting bolt. (Fig. 11)

(18) Slide the service sleeve into the replacement frame tip and align to the 2 mm (0.08 in.) off center line made previously during the sleeve assembly and tack the ring fillet welds to hold them in place. (Fig. 9) (Fig. 10) (Fig. 11) (Fig. 12)

(19) On 4X4 models, install the sway bar tapping plate and secure with tack welds. (Fig. 11) (Fig. 12)

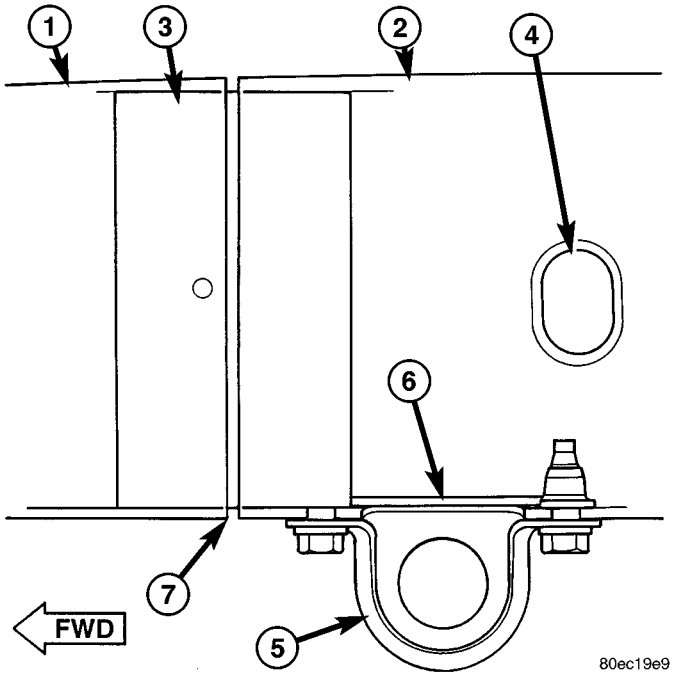

Fig. 9 4X2 SLEEVE INSTALLATION

1 - REPLACEMENT FRAME TIP
2 - FRAME RAIL
3 - SERVICE SLEEVE
4 - PLP
5 - SWAY BAR MOUNTING BRACKET
6 - TAPPING PLATE
7 - ROOT WELD GAP

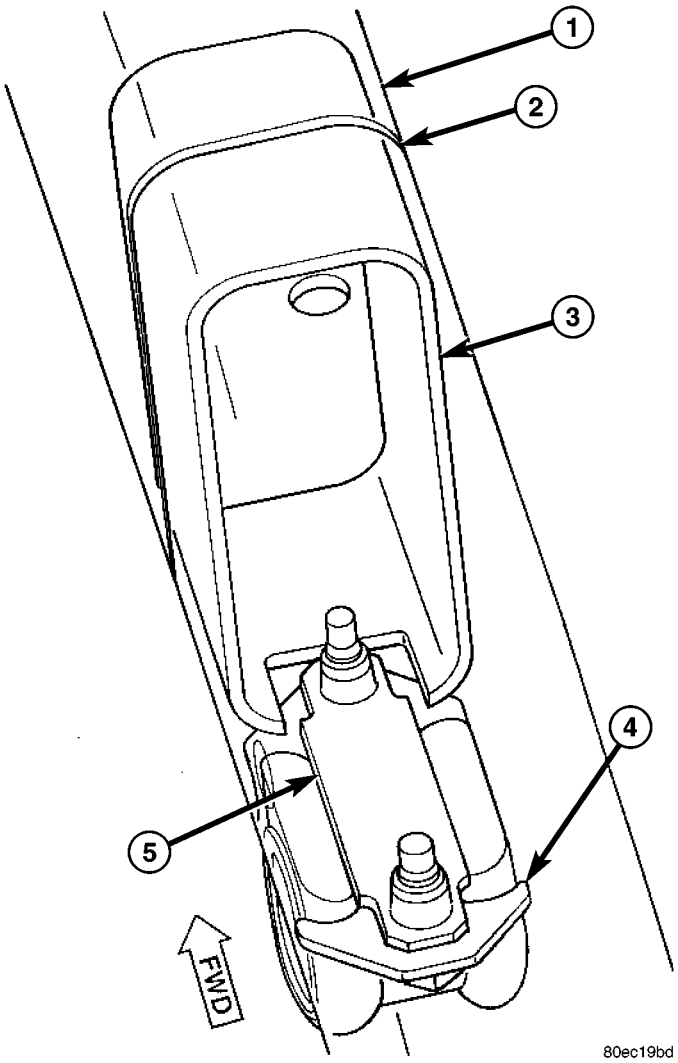

Fig. 10 4X2 SLEEVE INSTALLATION

5 - TAPPING PLATE

FRAME (Continued)

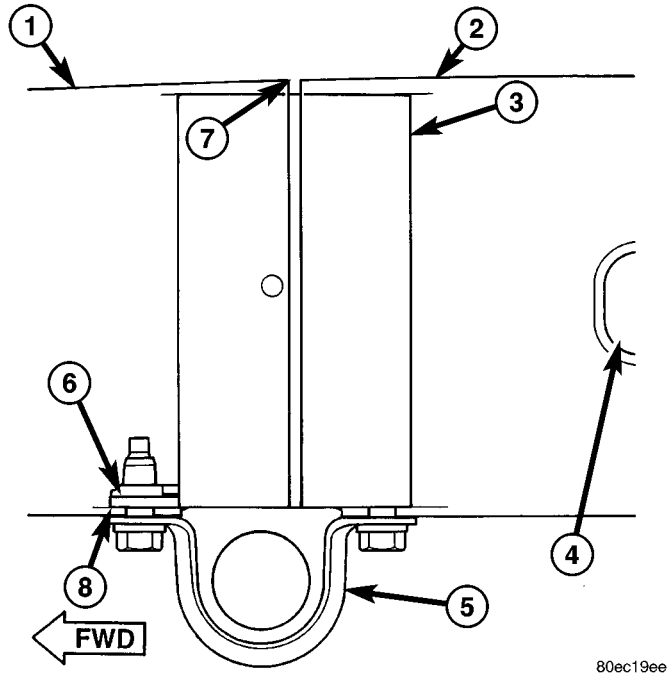

Fig. 11 4X4 TAPPING PLATE/SLEEVE INSTALLATION

1 - REPLACEMENT FRAME TIP
2 - FRAME RAIL
3 - SERVICE SLEEVE
4 - PLP
5 - SWAY BAR MOUNTING BRACKET
6 - TAPPING PLATE
7 - ROOT WELD GAP
8 - SLEEVE TAB

(20) Apply ring-fillet welds into the ring-fillet weld holes on the replacement frame tip (Fig. 13). (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS - WELDING)

(21) Install the upper FESM insulator onto the replacement tip and position the service sleeve/replacement tip into the existing frame rail.

(22) Loosely install the lower FESM insulator and cab mounting bolt.

(23) Using the appropriate measuring equipment, verify the front end sheet metal bracket's location in all three (X,Y, and Z) planes of space, and adjust if required. (Fig. 14)

CAUTION: Shield the surrounding area and components from exposure to the welding spatter and heat.

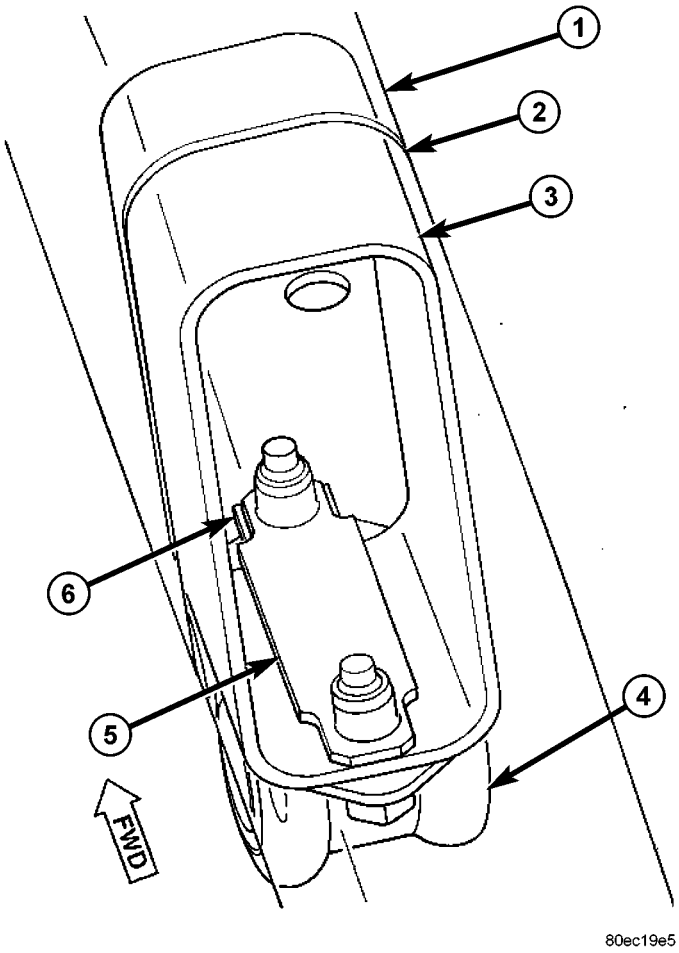

Fig. 12 4X4 TAPPING PLATE/SLEEVE INSTALLATION

1 - REPLACEMENT FRAME TIP
2 - ROOT WELD GAP
3 - SERVICE SLEEVE
4 - SWAY BAR MOUNTING BRACKET
5 - TAPPING PLATE
6 - SLEEVE TAB

(24) When correctly fitted and a weld root gap of 4 mm minimum to 6 mm maximum (0.16 in - 0.24 in) is established, tack the ring fillet welds to hold the tip in position, then complete the ring fillet welds.

NOTE: Ring-fillet welds may be filled in with weld material if an improved cosmetic appearance is desired.

FRAME (Continued)

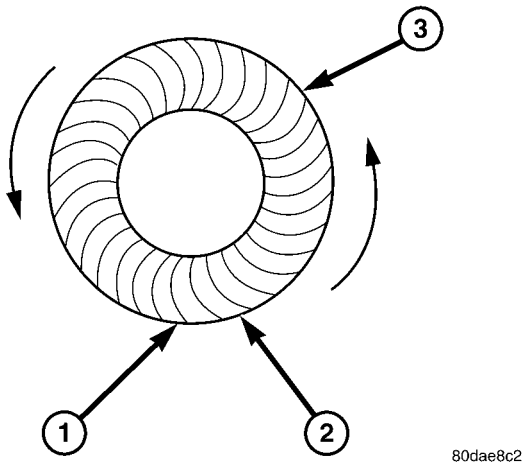

Fig. 13 RING FILLET WELD

1 - WELD START LOCATION
2 - WELD END LOCATION
3 - RING-FILLET WELD

(25) Confirm alignment of the replacement frame rail tip. (Fig. 14)

(26) Final welding should be performed in a skip (stitch) type method to minimize the heat buildup and frame distortion, utilizing the Weld Process Specifications at the end of this section. The preferred method is GMAW (MIG). (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS - WELDING)

(a) Apply root pass welds to the root joint one quadrant at a time, switching to the opposite side of the frame for each quadrant. (Fig. 8)

(b) Clean the welds of any flux and other impurities before proceeding with the cover pass welds.

(c) Apply the cover pass welds in the same manner as described above.

(27) Confirm alignment of the replacement frame rail tip. (Fig. 14)

NOTE: Any burned surface coatings will need to be removed prior to application of corrosion preventative coatings.

(28) Dress the welded area and apply corrosion resistant coatings inside and out.

(a) Apply etch-primer to the inside of the frame rail repair area.

(b) Inside the rail, inject a creeping wax based rust inhibitor compound through the existing holes in the frame ensuring 100% coverage including the space between the original frame rail and the reinforcing sleeve.

(c) Apply a durable top coat to the outside of the repair area.

(29) Tighten the front cab mounting bolt to the FESM bracket to 81 N·m (60 ft. lbs.).

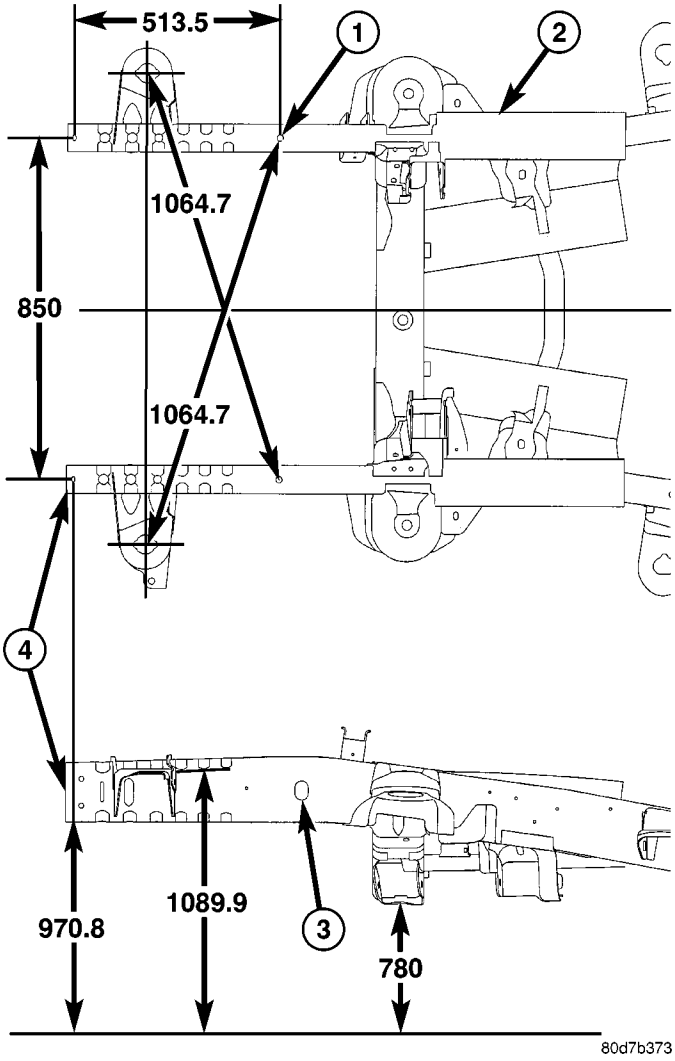

Fig. 14 FRAME TIP DIMENSIONS

1 - PLP POINT
2 - FRAME
3 - PLP POINT
4 - REPLACEMENT FRAME TIP

(30) Install the stabilizer bar. (Refer to 2 - SUSPENSION/FRONT/STABILIZER BAR - INSTALLATION)

(31) Install the front bumper. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION)

(32) Install the wire harness and ground strap if previously removed and install the bolt.

(a) If necessary, re-drill and tap the ground strap mounting hole

(33) Install the front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION)

FRAME (Continued)

SERVICE SLEEVE ASSEMBLY

NOTE: Two sleeve halves are included with each kit. Modifications as follow, are necessary to create the correct sleeve assembly for each application.

(1) On 4X2 models, the ″lower″ sleeve is made by cutting off the tab and cutting out a notch in the bottom sleeve portion. Round the corners of the cut out to keep stress cracks from forming. On 4X4 models the ″lower″ sleeve is used as provided. (Fig. 15)

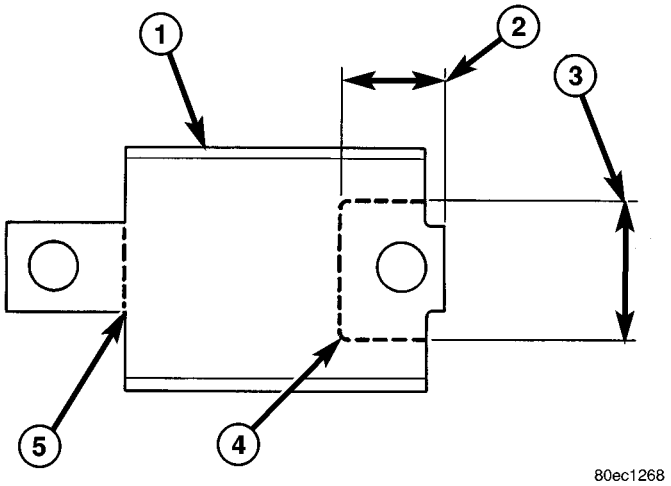

Fig. 15 4X2 LOWER SLEEVE CUT LOCATION

1 - SERVICE SLEEVE LOWER HALF
2 - CUT DIMENSION 27 mm (1.06 in.)
3 - CUT DIMENSION 36.1 mm (1.42 in)
4 - 4X2 CUTOUT
5 - FRONT TAB CUT LINE (4X2 ONLY)

(2) On both 4X2 and 4X4 models cut off the front tab on the upper sleeve portion. (Fig. 16)

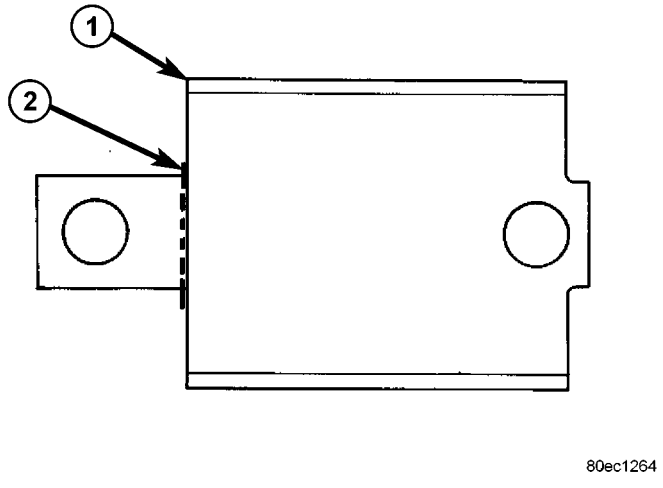

Fig. 16 UPPER SLEEVE CUT LOCATION

1 - SERVICE SLEEVE UPPER HALF
2 - CUT LOCATION

(3) The sleeve halves are shipped slightly oversized to allow custom fitting to each replacement frame rail tip. It is necessary to grind the mating surfaces to achieve the desired snug fit into the replacement tip (rail tube has increasing height rearward of the cut line). Once the two sleeve halves are fitted, bevel the edges 25° - 30°.

NOTE: Scribing a line 2 mm from the cut edge and then grinding back to the mark will simplify the bevel creation process and accuracy.

(4) Remove any burrs at the beveled edges.

(5) Using the Weld Process Specifications table (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS - WELDING), weld the two halves of the repair sleeve together. (Fig. 17)

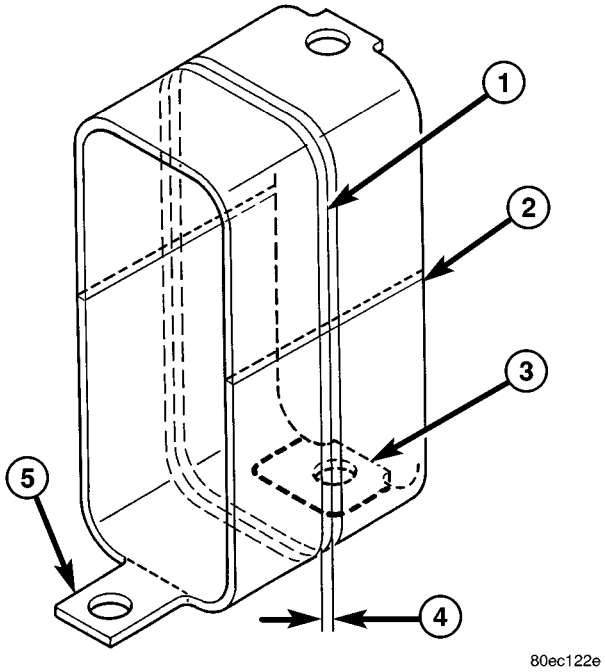

Fig. 17 SERVICE SLEEVE ASSEMBLY

1 - CENTERLINE SCRIBE MARK
2 - WELD SEAM
3 - REAR TAB (4X4 ONLY)
4 - SCRIBE LINE LOCATION 2 mm (0.08 in.)
5 - FRONT TAB (4X4 ONLY)

(6) Clean the welds of any flux and other impurities and grind smooth before proceeding with the installation of the sleeve.

(7) Find the centerline of the sleeve and scribe a centerline mark. Mark two additional lines 2 mm (0.08 in.) on either side of the centerline mark to help ensure the required 4 mm - 6 mm (0.16 in. - 0.24 in.) weld root gap. (Fig. 17)

FRAME (Continued)

STANDARD PROCEDURE - HYDROFORM FENDER RAIL REPAIR

CAUTION: This repair procedure assumes damage to the right or left hydroform fender rail (Fig. 18). Prior to any repairs, the vehicle must be mounted on the appropriate frame repair equipment ("frame rack"), checked with three dimensional measuring equipment, and necessary pull corrections made. If damage exists in the hydroform fender rail, or cab beyond the area covered by this service procedure after dimensional corrections are made, the hydroform must be replaced in its entirety. Refer to 23 - BODY/BODY STRUCTURE/WELD LOCATIONS - SPECIFICATIONS, when replacing the entire hydroform.

(1) Before proceding with this repair procedure review the required service warnings and precautions. (Refer to 13 - FRAME & BUMPERS/FRAME - WARNING)

(2) Disconnect and isolate the battery negative cable.

(3) Remove the front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL)

(4) Remove the fender. (Refer to 23 - BODY/EXTERIOR/FRONT FENDER - REMOVAL)

(5) Remove the A/C condenser, if required. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL)

(6) Remove the A/C lines, if required. Refer to the Heating and Air Conditioning section of the manual for recommended procedures.

(7) Remove the radiator assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL)

(8) Remove the air cleaner and support bracket, if required. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL)

(9) Remove the integrated power module. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - REMOVAL)

(10) Remove the bolts and position aside the wire harness and grounds, if required.

(11) Remove the upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/UPPER RADIATOR CROSSMEMBER - REMOVAL)

(12) Remove the headlamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL)

(13) Remove the front cab mount to the Front End Sheet Metal bracket (FESM) bolt.

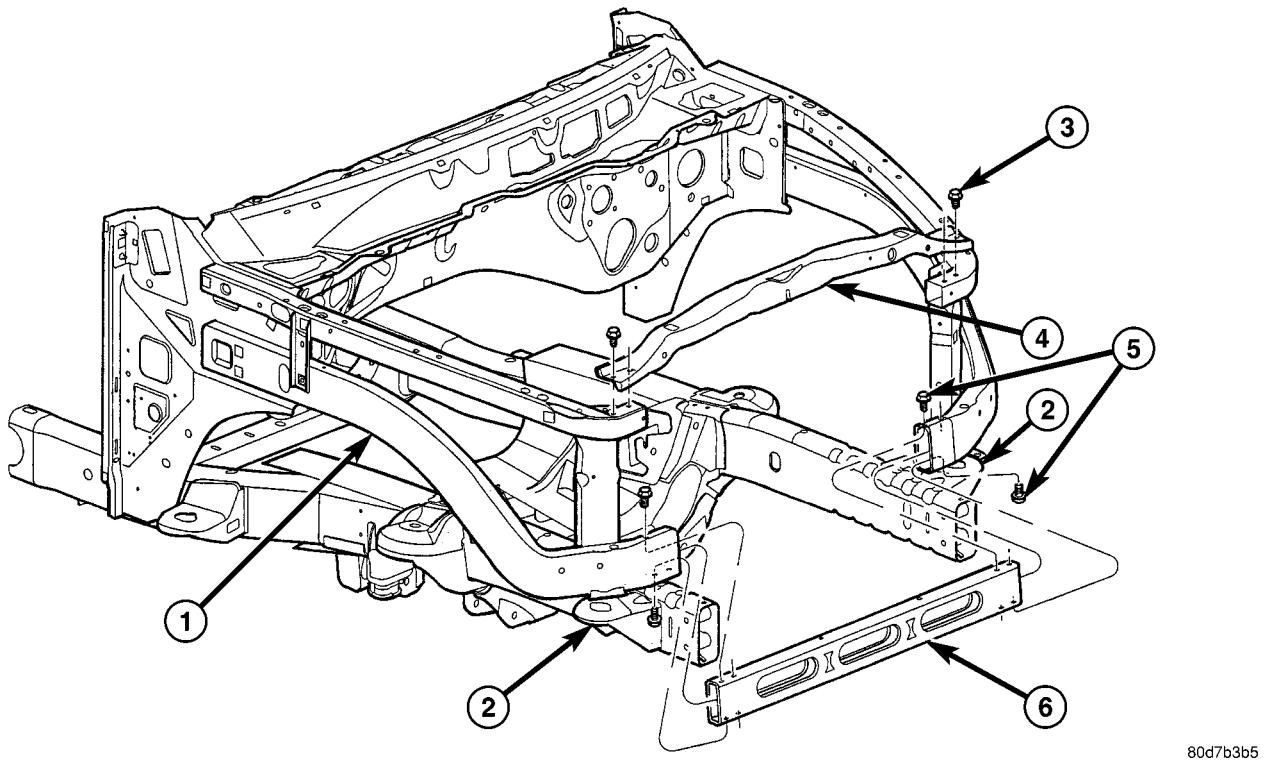

Fig. 18 HYDROFORM FENDER RAILS

1 - HYDROFORM FENDER RAIL
2 - FRONT END SHEET METAL BRACKET
3 - UPPER RADIATOR CROSSMEMBER BOLTS (4)
4 - UPPER RADIATOR CROSSMEMBER
5 - LOWER RADIATOR CROSSMEMBER BOLTS (8)
6 - LOWER RADIATOR CROSSMEMBER

FRAME (Continued)

(14) Remove the bolts attaching the lower radiator crossmember to the hydroform fender rail. (Fig. 18)

CAUTION: Do not use any flame or plasma cutting equipment to cut the frame in this procedure. The inaccurate and high temperatures achieved during flame or plasma cutting will change the metal characteristics and may weaken the frame and/or repair location.

(15) Using a reciprocating saw or equivalent, cut the fender rail and shotgun at a straight and square section of the hydroform and remove.

(16) Smooth and square the cut edges.

(17) Using the damaged structure as a reference cut the service part at the same location as the first cut. Smooth and square the cut edges.

NOTE: The repair structure should butt up to the remaining structure and provide the same overall vehicle geometry.

(18) Fabricate 51 mm (2.0 in.) long repair inserts using scrap from the old structure or the replacement part. It will be necessary to split the inserts on each of their four sides to fit into the hydroform.

(19) Remove any paint or e-coat from the inserts and also to the interior and exterior of the hydroforms.

(20) Cut plug weld holes as described below.

- On the upper rail, cut one 13 mm (0.5 in.) hole on each side of the rail, 25 mm (1.0 in.) from the butt joint of the tubes.
- On the lower rail, cut one 13 mm (0.5 in.) hole on the top and bottom sides of the rail 25 mm (1.0 in.) from the butt joint of the tube.
- On the lower rail, cut two 13 mm (0.5 in.) holes on the inner and outer sides of the rail 25 mm (1.0 in.) from the butt joint of the tube.

CAUTION: Shield the surrounding area and components from exposure to the welding spatter and heat.

(21) Install the insert 1” into the replacement part and tack into place with a weld. (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS - WELDING)

(22) Insert the service part into place and using the appropriate measuring equipment, verify the front end sheet metal bracket’s location in all three (X,Y, and Z) planes of space. (Fig. 19)

(23) Complete all 360° plug welds.

NOTE: Before the final welding, use three dimensional measuring equipment to ensure the part is in the correct location. Verify that tap plate extrusion at the bottom of the vertical post lines up with the isolator and hole in the frame perch mount. Also ensure the lower radiator closure tube is bolted into the forward shotgun ends.

(24) Complete welding by making a 360° butt weld around the fender rails.

(25) Metal finish the exposed welds on the hydroforms.

(26) Dress the welded area and apply corrosion resistant coatings inside and out.

(a) Inside the rail, inject a creeping wax based rust inhibitor compound to the inside of the hydroforms ensuring 100% coverage including the mating face between the fender rail sections and insert such that corrosion protection is restored in the internal cavity.

(b) Apply a durable top coat to the outside of the repair area.

(27) Install the front cab mount bolt if previously removed and tighten to 81 N·m (60 ft. lbs.).

(28) Install the lower radiator crossmember bolts and tighten to 28 N·m (21 ft. lbs.).

(29) Install the headlamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION)

(30) Install the upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/UPPER RADIATOR CROSSMEMBER - INSTALLATION)

(31) Install the wire harness and ground if previously removed and install the bolts.

(32) Install the integrated power module, if previously removed. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - INSTALLATION)

(33) Install the air cleaner bracket and air cleaner, if previously removed. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION)

(34) Install the radiator assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION)

(35) Install the A/C lines, if previously removed. Refer to the Heating and Air Conditioning section of the manual for the recommended procedures.

(36) Install the A/C condenser, if previously removed. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION)

(37) Install the fender. (Refer to 23 - BODY/EXTERIOR/FRONT FENDER - INSTALLATION)

(38) Install the front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION)

(39) Reconnect the battery ground.

FRAME (Continued)

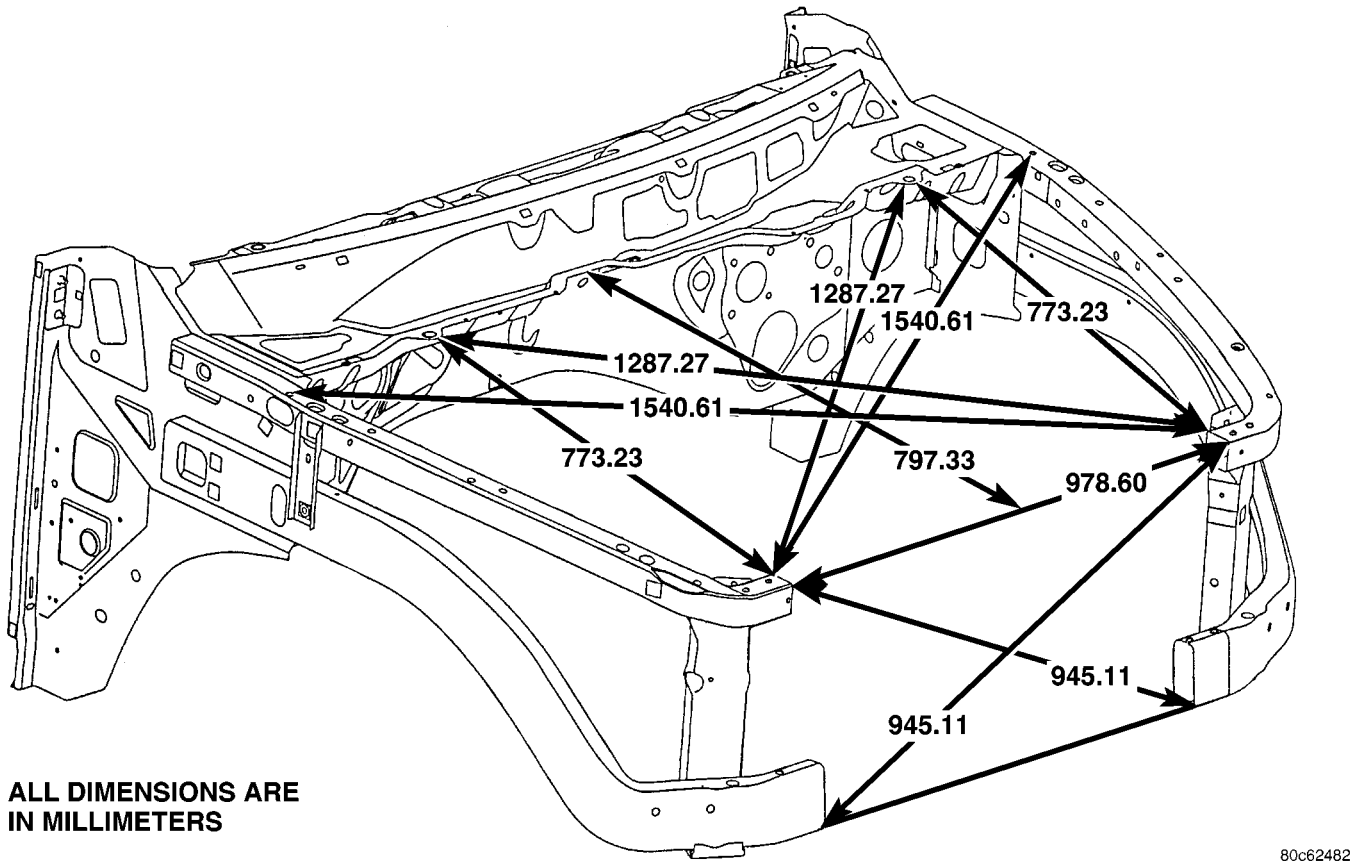

Fig. 19 ENGINE COMPARTMENT/FRONT STRUCTURE

STANDARD PROCEDURE - REAR FRAME H-SECTION REPLACEMENT

CAUTION: This procedure is designed to replace the H-section/spare tire support located at the rear of the frame assembly. Prior to any cutting, the vehicle must be mounted on the appropriate frame repair equipment ("frame rack"), checked with three dimensional measuring equipment, and the necessary pull corrections made. If damage remains in the frame beyond the area covered by this service part after the pull, the frame must be replaced in its entirety.

(1) Before proceding with this repair procedure review the required service warnings and precautions. (Refer to 13 - FRAME & BUMPERS/FRAME - WARNING)

(2) Disconnect and isolate the battery negative cable.

(3) Remove the cargo box. (Refer to 23 - BODY/EXTERIOR/CARGO BOX - REMOVAL)

(4) Remove the trailer hitch. (Refer to 13 - FRAME & BUMPERS/FRAME/TRAILER HITCH - REMOVAL)

(5) Raise and support the frame so the tires are off floor.

(6) Remove the shock absorbers. (Refer to 2 - SUSPENSION/REAR/SHOCK - REMOVAL)

(7) Remove the rear leaf spring shackle bolts and let the axle rest on the ground. (Fig. 20)

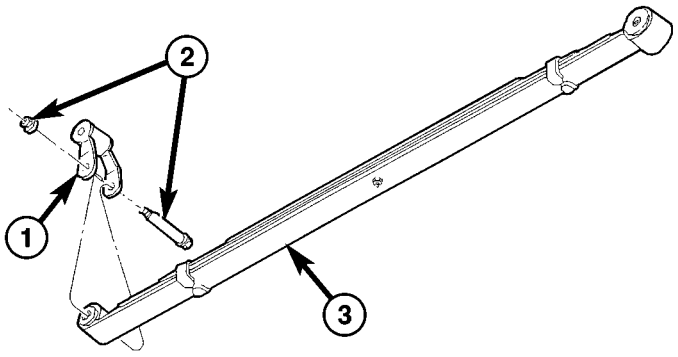

Fig. 20 REAR SPRING

1 - SPRING SHACKLE
2 - LEAF SPRING EYE BOLT/NUT
3 - REAR LEAF SPRING

(8) Remove the spare wheel.

FRAME (Continued)

(9) Remove the clip and remove the spare tire winch tube. (Fig. 21)

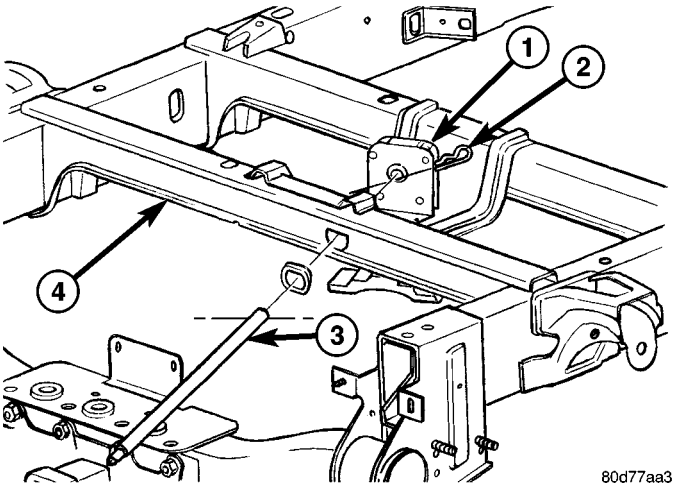

Fig. 21 SPARE TIRE WINCH TUBE

1 - SPARE TIRE WINCH ASSEMBLY
2 - HAIR PIN CLIP
3 - WINCH TUBE
4 - H-SECTION/SPARE WHEEL SUPPORT

(10) Remove the bolts and remove the spare tire winch. (Fig. 22)

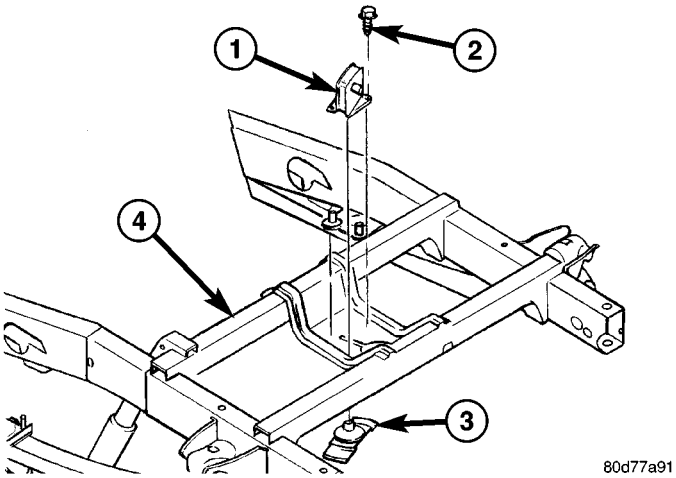

Fig. 22 SPARE TIRE WINCH ASSEMBLY

1 - SPARE TIRE WINCH ASSEMBLY
2 - BOLTS
3 - RETAINER BRACKET
4 - H-SECTION/SPARE WHEEL SUPPORT

(11) Position the wire harness forward of the work area.

CAUTION: Do not use any flame or plasma cutting equipment to cut the frame in this procedure. The inaccurate and high temperatures achieved during flame or plasma cutting will change the metal characteristics and may weaken the frame and/or repair location.

(12) Carefully remove the H-section welds using a grinder or equivalent tool.

(13) Remove the H-section and clean any remaining welds from the frame.

(14) Trial fit the replacement part.

(15) Remove all e-coat from within 25 mm (1.0 in.) of the weld area.

(16) Using the appropriate measuring equipment, position the replacement part and verify correct positioning in all three (X,Y, and Z) planes of space. (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS - FRAME DIMENSIONS)

CAUTION: Shield the surrounding area and components from exposure to the welding spatter and heat.

(17) Weld the replacement H-section into position. The welding should be performed in a skip (stitch) type method to minimize the heat buildup following I-CAR or the American Welding Society welding procedures and utilizing the process specifications at the end of this section. (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS - WELDING)

(18) Dress the welded area and apply corrosion resistant coatings inside and out.

(a) Inside the rail, inject a creeping wax based rust inhibitor compound through the existing holes in the frame ensuring 100% coverage including the mating face between the frame and replacement H-section.

(b) Apply a durable top coat to the outside of the repair area.

(19) Position the wiring harness back.

CAUTION: Inspect the tire winch assembly for damage. If any one or more of the following are evident, replace the winch assembly.

- **Indications of cracked or bulging plastic.**
- **Housing flanges are bent or cracked.**
- **If winch was loose before repair.**

(20) Install the spare tire winch and install the bolts. (Fig. 22)

(21) Tighten the bolts to 41 N·m (30 ft. lbs.).

(22) Install the spare tire winch tube and install the clip. (Fig. 21)

(23) Install the spare tire.

CAUTION: Check operation of the spare tire winch by manipulating it up and down. If the winch binds or jambs, replace the winch assembly.

(24) Lift the axle into position and install the rear shackle bolts. (Fig. 20)

(25) Tighten the bolts to 163 N·m (120 ft. lbs.).

FRAME (Continued)

(26) Install the lower shock absorber bolts. (Refer to 2 - SUSPENSION/REAR/SHOCK - INSTALLATION)

(27) Install the trailer hitch. (Refer to 13 - FRAME & BUMPERS/FRAME/TRAILER HITCH - INSTALLATION)

(28) Install the cargo box. (Refer to 23 - BODY/EXTERIOR/CARGO BOX - INSTALLATION)

(29) Reconnect the battery ground.

Flat & Overhead	Flat - Push or Drag	Flat - Push or Drag	Flat - Drag

***First choice - Gas Metal Arc Welding Process:** Butt joints - apply two layers (passes) of weld metal. First pass should only fill approximately ½ the thickness. Vertical position welds - maintain electrode wire at leading edge of weld puddle while traveling down hill to produce maximum penetration into the sleeve. These techniques work for FCAW as well.

****E7018** new electrodes may be exposed to the atmosphere for up to ten hours with no harmful effect. Reconditioning schedules should come from the manufacturer.

FRAME (Continued)

SPECIFICATIONS - FRAME DIMENSIONS

NOTE: Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

FRONT CROSSMEMBER

REMOVAL

(1) Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the front skid plate, if equipped. (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL)

(3) Remove the bolts and remove the crossmember. (Fig. 28) or (Fig. 29)

INSTALLATION

(1) Install the crossmember.

(2) Install the bolts;

- On light duty 2WD vehicles, tighten the bolts to 61 N·m (45 ft. lbs.).
- On light duty 4WD vehicles, tighten the bolts to 102 N·m (75 ft. lbs.).
- On heavy duty 2WD vehicles, tighten the bolts to 75 N·m (55 ft. lbs.).

(3) Install the front skid plate, if equipped. (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION)

(4) Install the transfercase skid plate. (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

TRAILER HITCH

REMOVAL

(1) Remove the rear bumper. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - REMOVAL)

(2) Remove the hitch bolts. (Fig. 35) and (Fig. 36)

(3) Disconnect all wire harness support push pins.

(4) Remove the rear two cargo box bolts and loosen the remaining bolts. (Refer to 23 - BODY/EXTERIOR/CARGO BOX - REMOVAL)

(5) Using a suitable lifting device, lift and support the rear of the cargo box and remove the hitch.

INSTALLATION

(1) Install the hitch onto the frame rails and make sure the locators on the inside of the hitch brackets are engaged with the holes in the top of the frame rails properly.

(2) Lower the cargo box and install the rear bolts. (Refer to 23 - BODY/EXTERIOR/CARGO BOX - INSTALLATION)

(3) Install the hitch bolts and tighten to 170 N·m (125 ft. lbs.).

(4) Connect all wire harness support push pins.

(5) Install the rear bumper. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - INSTALLATION)

FUEL DELIVERY - GAS

DESCRIPTION

The fuel delivery system consists of:

- a fuel pump module containing the electric fuel pump, fuel filter/fuel pressure regulator, fuel gauge sending unit (fuel level sensor) and a secondary fuel filter located at the bottom of the pump module
- fuel tubes/lines/hoses
- a combination fuel filter/fuel pressure regulator
- quick-connect fittings
- fuel injector rail
- fuel tank
- fuel tank filler/vent tube assembly
- fuel tank filler tube cap
- accelerator pedal
- throttle cable

Certain fuel delivery components can be found in (Fig. 1).

FUEL DELIVERY - GAS (Continued)

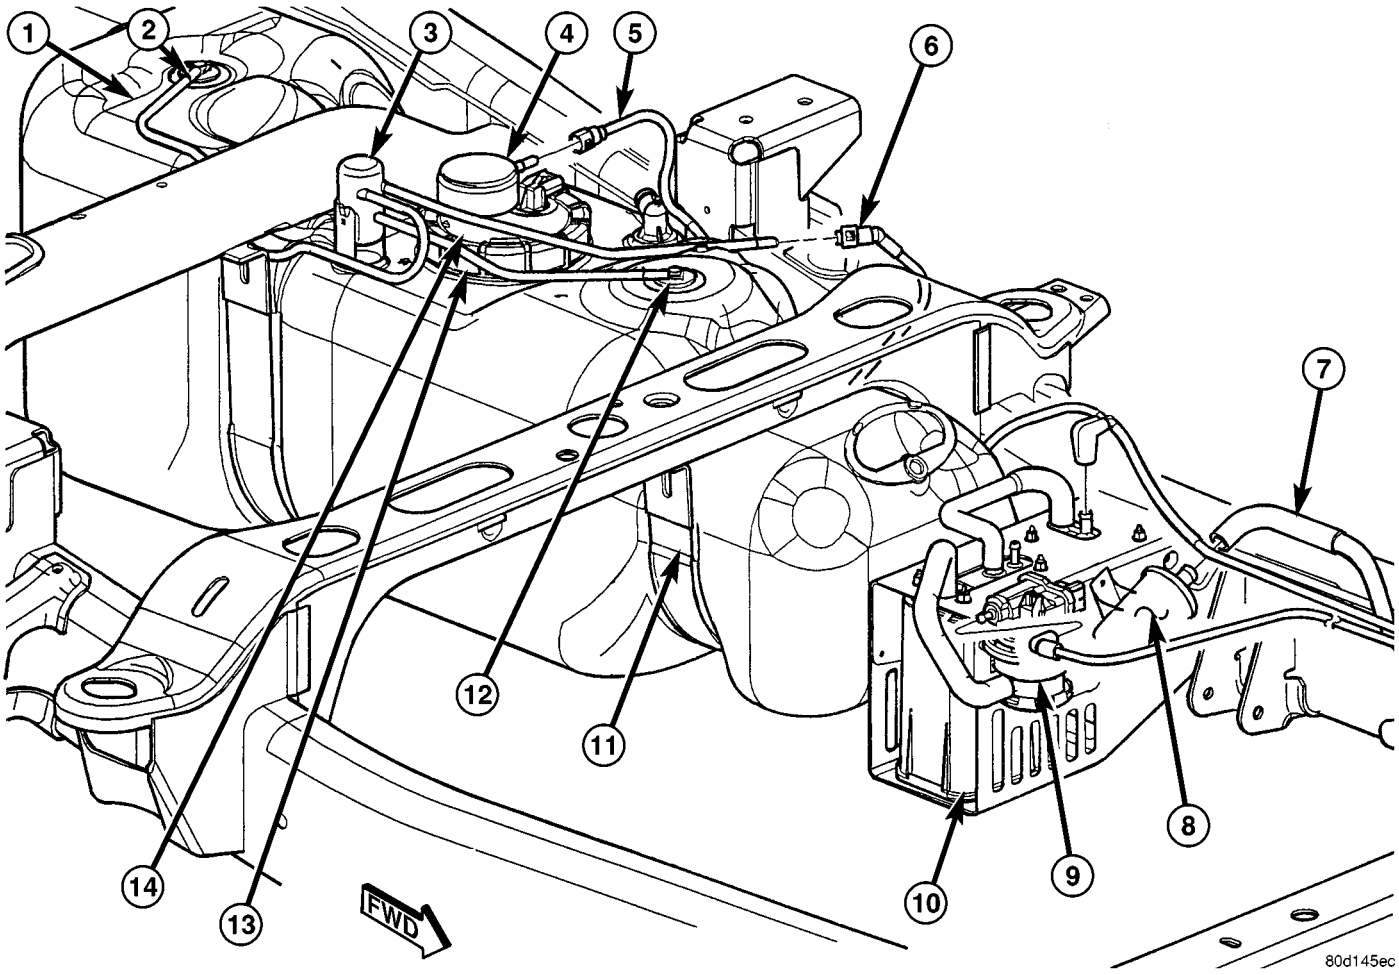

Fig. 1 FUEL DELIVERY COMPONENTS

1 - FUEL TANK
2 - CHECK VALVE
3 - LIQUID EXPANSION CHAMBER
4 - FUEL FILTER / FUEL PRESSURE REGULATOR
5 - QUICK-CONNECT FITTING AND FUEL LINE (TO ENGINE)
6 - EVAP LINE CONNECTION
7 - LEAK DETECTION PUMP FRESH AIR LINE
8 - LDP FRESH AIR FILTER
9 - LEAK DETECTION PUMP
10 - EVAP CANISTERS (2)
11 - FUEL TANK STRAPS (2)
12 - CHECK VALVE
13 - FUEL PUMP MODULE LOCK RING
14 - FUEL PUMP MODULE

OPERATION

Fuel is returned through the fuel pump module and back into the fuel tank through the fuel filter/ fuel pressure regulator. A separate fuel return line from the engine to the tank is not used.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module locknut/gasket, and fuel tank check valve (refer to Fuel Tank Check Valve for information).

A fuel filler/vent tube assembly using a pressure/ vacuum, 1/4 turn fuel filler cap is used. The fuel filler tube contains a flap door located below the fuel fill cap.

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE

Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.

(1) Remove fuel fill cap.

FUEL DELIVERY - GAS (Continued)

(2) Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.
(3) Start and run engine until it stalls.
(4) Attempt restarting engine until it will no longer run.
(5) Turn ignition key to OFF position.

CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.

(6) Unplug connector from any fuel injector.
(7) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.
(8) Connect other end of jumper wire to positive side of battery.
(9) Connect one end of a second jumper wire to remaining injector terminal.

CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.

(10) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.
(11) Place a rag or towel below fuel line quick-connect fitting at fuel rail.
(12) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.
(13) Return fuel pump relay to PDC.
(14) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB® scan tool must be used to erase a DTC.

FUEL FILTER/PRESSURE REGULATOR

DESCRIPTION

A combination fuel filter and fuel pressure regulator (Fig. 2) is used on all engines. It is located on the top of the fuel pump module. A separate frame mounted fuel filter is not used with any engine.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

FUEL FILTER/PRESSURE REGULATOR (Continued)

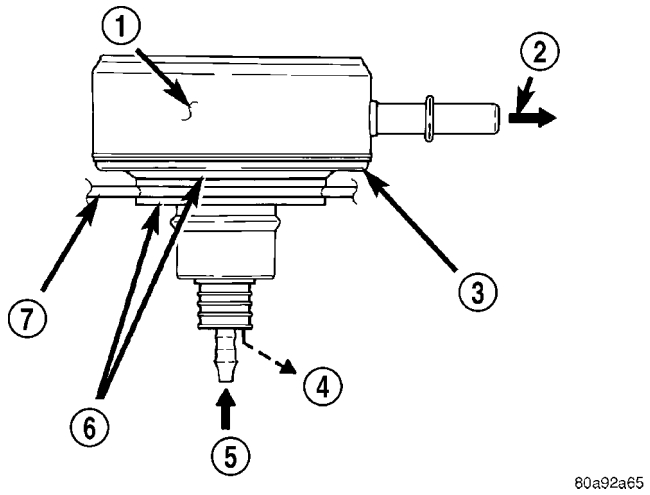

Fig. 2 SIDE VIEW - FILTER/REGULATOR

2 - FUEL FLOW TO FUEL INJECTORS
3 - FUEL FILTER/FUEL PRESSURE REGULATOR
4 - EXCESS FUEL BACK TO TANK
5 - FUEL INLET
6 - RUBBER GROMMET
7 - TOP OF PUMP MODULE

OPERATION

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is not controlled by engine vacuum or the Powertrain Control Module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 58 ± 2 psi at the fuel injectors. It contains a diaphragm, calibrated springs and a fuel return valve. The internal fuel filter (Fig. 2) is also part of the assembly.

Fuel is supplied to the filter/regulator by the electric fuel pump through an opening tube at the bottom of filter/regulator (Fig. 2).

The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet end of the electric fuel pump. **Refer to Fuel Pump - Description and Operation for more information.**

If fuel pressure at the pressure regulator exceeds approximately 60 psi, an internal diaphragm opens and excess fuel pressure is routed back into the tank through the bottom of pressure regulator.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

For Fuel Gauge Operation: A constant current source is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel pump module electrical connector unplugged). With the connectors plugged, output voltages will vary from about 0.6 volts at FULL, to about 8.6 volts at EMPTY (about 8.6 volts at EMPTY for Jeep models, and about 7.0 volts at EMPTY for Dodge Truck models).** The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

For OBD II Emission Monitor Requirements: The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

REMOVAL

The fuel level sending unit (fuel level sensor) and float assembly is located on the side of the fuel pump module (Fig. 3).

(1) Remove fuel pump module from fuel tank. Refer to Fuel Pump Module Removal/Installation.

(2) To remove sending unit from pump module, lift on plastic locking tab (Fig. 4) while sliding sending unit tracks.

(3) Disconnect 4–wire electrical connector (Fig. 3) from fuel pump module. Separate necessary sending unit wiring from connector using terminal pick / removal tool. Refer to Special Tools in 8W Wiring for tool part numbers.

8 - GASKET (SEAL)

INSTALLATION

(1) Connect necessary wiring into electrical connectors. Connect 4–wire electrical connector to pump module.

(2) Position sending unit to pump module. Slide and snap into place.

(3) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

FUEL LINES

DESCRIPTION

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM MAY BE UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS, LINES, OR MOST COMPONENTS, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

QUICK CONNECT FITTING

DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to Quick-Connect Fittings Removal/Installation for more information.

CAUTION: The interior components (o-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

Also refer to Fuel Tubes/Lines/Hoses and Clamps.

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Safety latch clips are used on certain components/lines. Certain fittings may require use of a special tool for disconnection.

DISCONNECTING

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSE, FITTING OR LINE, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

CAUTION: The interior components (o-rings, spacers) of some types of quick-connect fitting are not serviced separately. If service parts are not available, do not attempt to repair a damaged fitting or fuel line. If repair is necessary, replace complete fuel line assembly.

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) **2–Button Type Fitting:** This type of fitting is equipped with a push-button located on each side of quick-connect fitting (Fig. 5). Press on both buttons simultaneously for removal. Special tools are not required for disconnection.

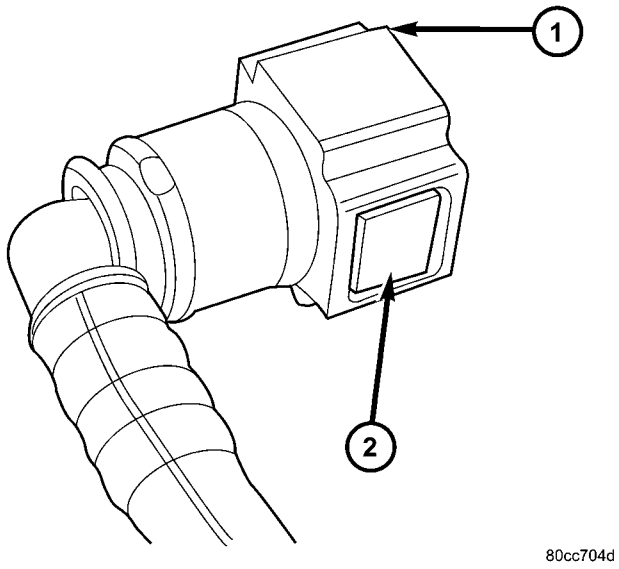

Fig. 5 2-BUTTON TYPE FITTING

1 - QUICK-CONNECT FITTING
2 - PUSH-BUTTONS (2)

(5) **Pinch-Type Fitting:** This fitting is equipped with two finger tabs. Pinch both tabs together while removing fitting (Fig. 6). Special tools are not required for disconnection.

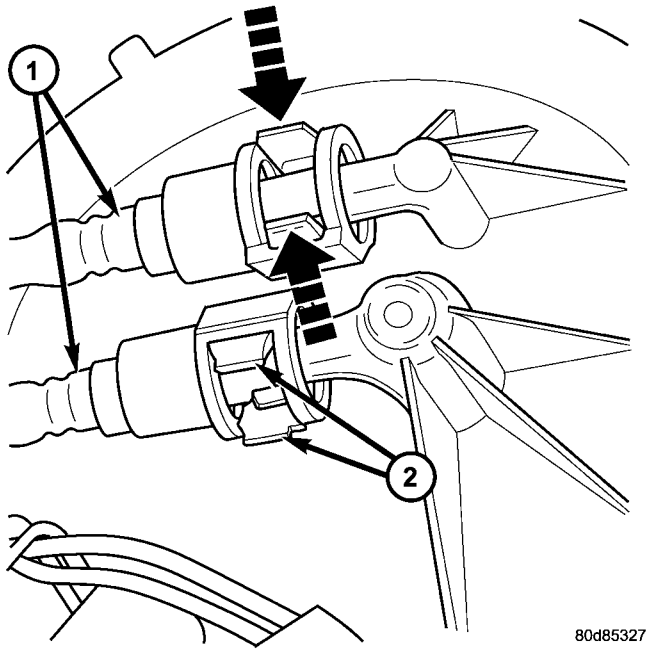

Fig. 6 PINCH TYPE QUICK-CONNECT FITTING

1 - QUICK-CONNECT FITTINGS
2 - PINCH TABS

QUICK CONNECT FITTING (Continued)

(6) **Single-Tab Type Fitting:** This type of fitting is equipped with a single pull tab (Fig. 7). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component. Special tools are not required for disconnection.

(a) Press release tab on side of fitting to release pull tab (Fig. 8). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

(b) While pressing release tab on side of fitting, use screwdriver to pry up pull tab (Fig. 8).

(c) Raise pull tab until it separates from quick-connect fitting (Fig. 9).

(7) **Two-Tab Type Fitting:** This type of fitting is equipped with tabs located on both sides of fitting (Fig. 10). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

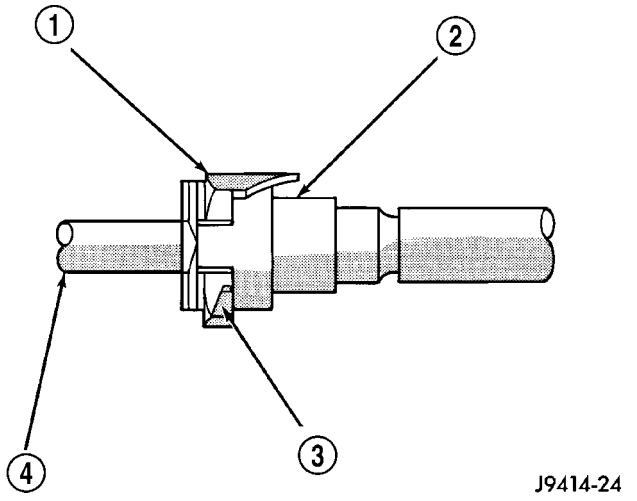

Fig. 7 SINGLE-TAB TYPE FITTING

1 - PULL TAB
2 - QUICK-CONNECT FITTING
3 - PRESS HERE TO REMOVE PULL TAB
4 - INSERTED TUBE END

(a) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 10) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.

(b) Pull fitting from fuel system component being serviced.

(c) The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

(8) **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 11) usually black in color.

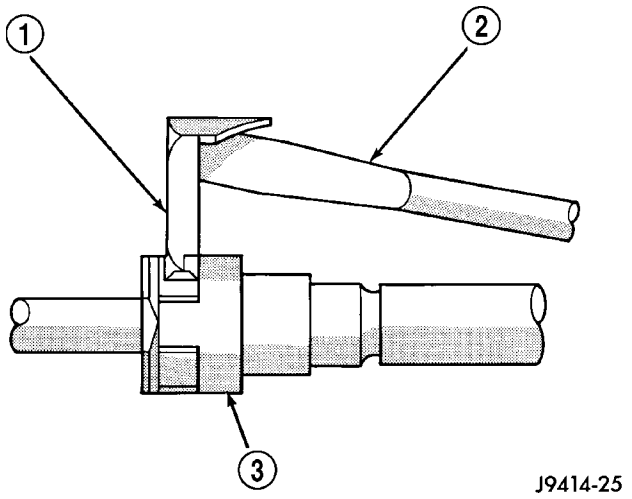

Fig. 8 DISCONNECTING SINGLE-TAB TYPE FITTING

2 - SCREWDRIVER
3 - QUICK-CONNECT FITTING

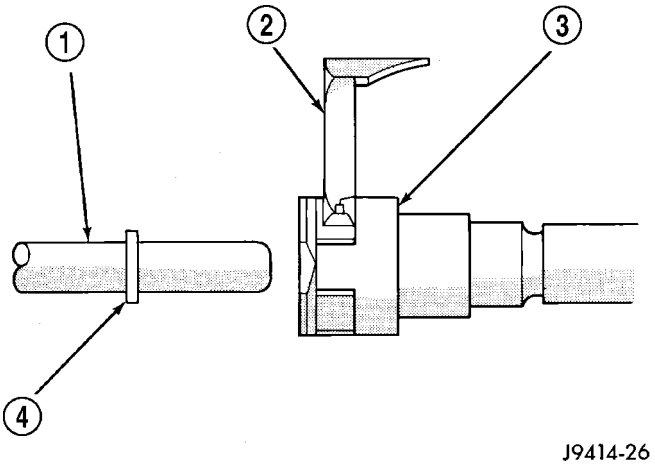

Fig. 9 REMOVING PULL TAB

1 - FUEL TUBE OR FUEL SYSTEM COMPONENT
2 - PULL TAB
3 - QUICK-CONNECT FITTING
4 - FUEL TUBE STOP

(a) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 11). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(b) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

6 - PUSH
7 - PUSH
8 - PUSH

(c) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(9) **Latch Clips:** Depending on vehicle model and engine, 2 different types of safety latch clips are used (Fig. 12) or (Fig. 13). Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

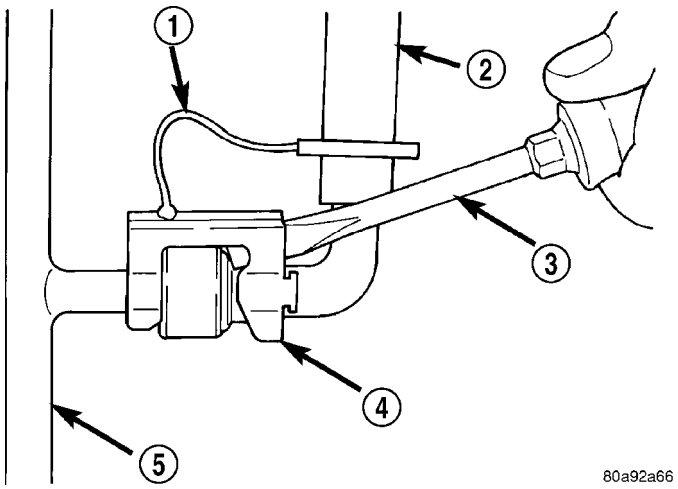

Fig. 12 LATCH CLIP-TYPE 1

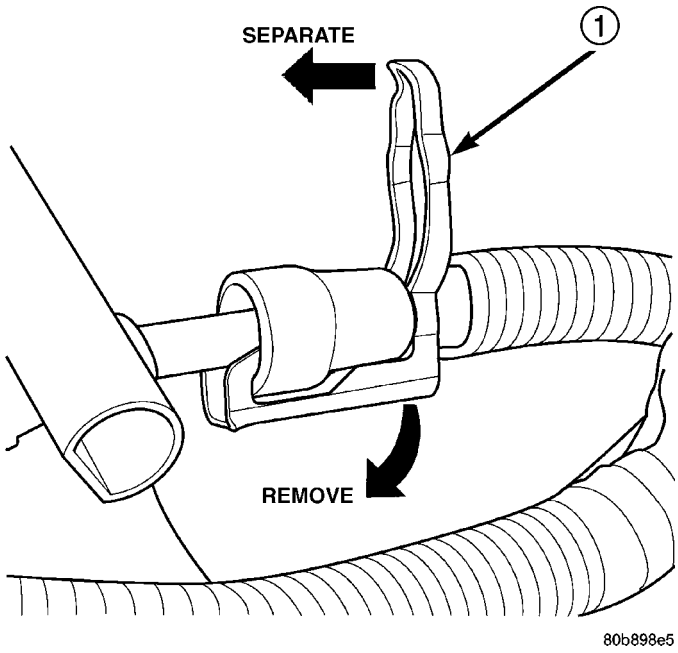

Fig. 13 LATCH CLIP-TYPE 2

1 - LATCH CLIP

(a) Type 1: Pry up on latch clip with a screwdriver (Fig. 12).

(b) Type 2: Separate and unlatch 2 small arms on end of clip (Fig. 13) and swing away from fuel line.

(c) Slide latch clip toward fuel rail while lifting with screwdriver.

QUICK CONNECT FITTING (Continued)

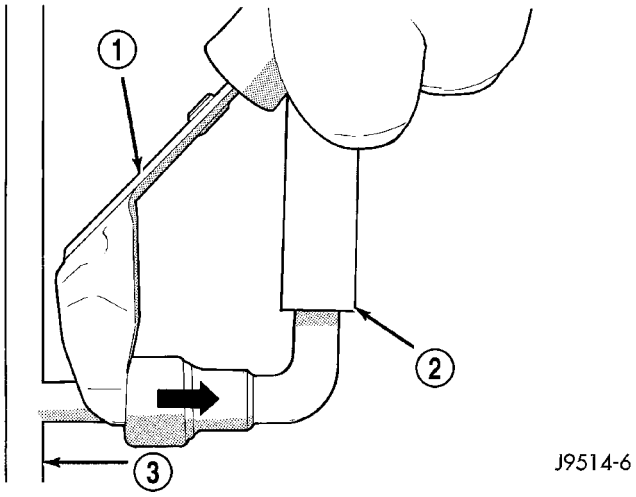

Fig. 14 FUEL LINE DISCONNECTION USING SPECIAL TOOL

1 - SPECIAL FUEL LINE TOOL
2 - FUEL LINE
3 - FUEL RAIL

(d) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 14). Use tool to release locking fingers in end of line.

(e) With special tool still inserted, pull fuel line from fuel rail.

(f) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(10) Disconnect quick-connect fitting from fuel system component being serviced.

CONNECTING

(1) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(2) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(3) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(4) Continue pushing until a click is felt.

(5) Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.

(6) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(7) Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**

(8) Connect negative cable to battery.

(9) Start engine and check for leaks.

FUEL PUMP

DESCRIPTION

The electric fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump. The electric fuel pump is not a separate, serviceable component.

OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The bottom section of the fuel pump module contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.**

The electric fuel pump is not a separate, serviceable component.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module assembly is located on the top of the fuel tank (Fig. 1). The complete assembly contains the following components:

- A combination fuel filter/fuel pressure regulator
- A separate fuel pick-up, or inlet filter
- An electric fuel pump
- A lockring to retain pump module to tank
- A soft gasket between tank flange and module
- A fuel gauge sending unit (fuel level sensor)
- Fuel line connection

The fuel gauge sending unit may be serviced separately. If the electrical fuel pump, primary inlet filter, fuel filter or fuel pressure regulator require service, the fuel pump module must be replaced.

OPERATION

Refer to Fuel Pump, Inlet Filter, Fuel Filter / Fuel Pressure Regulator and Fuel Gauge Sending Unit.

FUEL PUMP MODULE (Continued)

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING THE FUEL PUMP MODULE, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Drain and remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) The plastic fuel pump module locknut (Fig. 15) is threaded onto fuel tank. Install Special Tool 6856 to locknut and remove locknut (Fig. 16). The fuel pump module will spring up slightly when locknut is removed.

(3) Remove module from fuel tank.

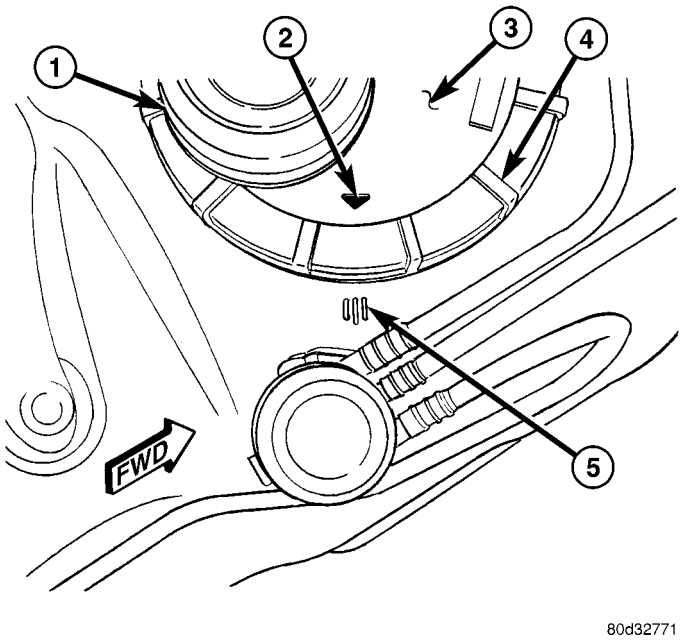

Fig. 15 FUEL PUMP MODULE (TOP)

1 - FUEL FILTER / FUEL PRESSURE REGULATOR
2 - ALIGNMENT ARROW
3 - TOP OF PUMP MODULE
4 - LOCKNUT
5 - ALIGNMENT MARKS

INSTALLATION

CAUTION: Whenever the fuel pump module is serviced, the rubber gasket must be replaced.

(1) Using a new gasket, position fuel pump module into opening in fuel tank.

(2) Position locknut over top of fuel pump module. Install locknut finger tight.

(3) Rotate module until embossed alignment arrow (Fig. 15) points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank. Also be sure fitting on fuel filter/fuel pressure regulator is pointed to drivers side of vehicle.

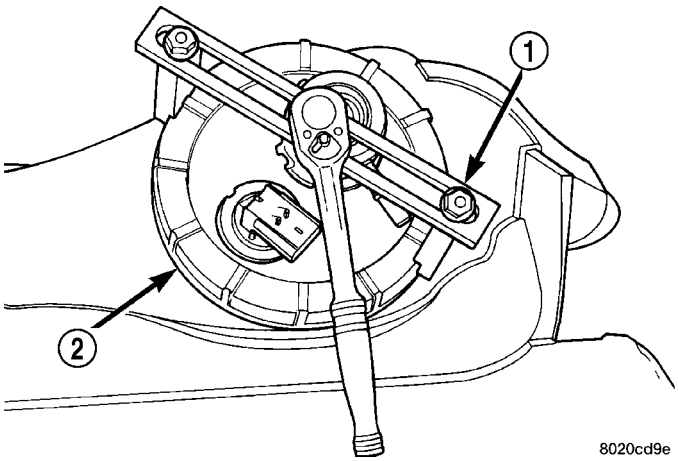

Fig. 16 LOCKNUT REMOVAL/INSTALLATION - TYPICAL

1 - SPECIAL TOOL 6856
2 - LOCKNUT

(4) Install Special Tool 6856 (Fig. 16) to locknut.

(5) Tighten locknut. Refer to Torque Specifications.

(6) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL RAIL

DESCRIPTION

The fuel injector rail is used to mount the fuel injectors to the engine.

OPERATION

High pressure from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

A quick-connect fitting with a safety latch clip is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

CAUTION: The left and right sections of the fuel rail are connected with either a flexible connecting hose, or joints. Do not attempt to separate the rail halves at these connecting hose or joints. Due to the design of the connecting hose or joint, it does not use any clamps. Never attempt to install a clamping device of any kind to the hose or joint. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose or joint.

FUEL RAIL (Continued)

REMOVAL

3.7L V-6

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tubes (Fig. 18). Due to design of tubes, it does not use any clamps. Never attempt to install a clamping device of any kind to tubes. When removing fuel rail assembly for any reason, be careful not to bend or kink tubes.

(1) Remove fuel tank filler tube cap.
(2) Perform Fuel System Pressure Release Procedure.
(3) Remove negative battery cable at battery.
(4) Remove air duct at throttle body air box.
(5) Remove air box at throttle body.
(6) Remove air resonator mounting bracket at front of throttle body (2 bolts).
(7) Disconnect fuel line latch clip and fuel line at fuel rail. A special tool will be necessary for fuel line disconnection. Refer to Quick-Connect Fittings.
(8) Remove necessary vacuum lines at throttle body.
(9) Disconnect electrical connectors at all 6 fuel injectors. To remove connector refer to (Fig. 17). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.
(10) Disconnect electrical connectors at all throttle body sensors.
(11) Remove 6 ignition coils. Refer to Ignition Coil Removal/Installation.
(12) Remove 4 fuel rail mounting bolts (Fig. 18).
(13) Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in cylinder head. Gently rock and pull **right** side of rail until injectors just start to clear cylinder head holes. Repeat this procedure (left/right) until all injectors have cleared cylinder head holes.
(14) Remove fuel rail (with injectors attached) from engine.
(15) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tubes (Fig. 19). Due to design of tubes, it does not use any clamps. Never attempt to install a clamping device of any kind to tubes. When removing fuel rail assembly for any reason, be careful not to bend or kink tubes.

(1) Remove fuel tank filler tube cap.
(2) Perform Fuel System Pressure Release Procedure.
(3) Remove negative battery cable at battery.
(4) Remove air duct at throttle body air box.
(5) Remove air box at throttle body.
(6) Remove air resonator mounting bracket at front of throttle body (2 bolts).
(7) Disconnect fuel line latch clip and fuel line at fuel rail. A special tool will be necessary for fuel line disconnection. Refer to Quick-Connect Fittings.
(8) Remove necessary vacuum lines at throttle body.
(9) Disconnect electrical connectors at all 8 fuel injectors. To remove connector refer to (Fig. 17). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.
(10) Disconnect electrical connectors at all throttle body sensors.
(11) Remove 8 ignition coils. Refer to Ignition Coil Removal/Installation.
(12) Remove 4 fuel rail mounting bolts (Fig. 19).
(13) Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in cylinder head. Gently rock and pull **right** side of rail until injectors just start to clear cylinder head holes. Repeat this procedure (left/right) until all injectors have cleared cylinder head holes.
(14) Remove fuel rail (with injectors attached) from engine.
(15) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

5.7L V-8

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tube (Fig. 20). Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When removing fuel rail assembly for any reason, be careful not to bend or kink tube.

(1) Remove fuel tank filler tube cap.

FUEL RAIL (Continued)

(2) Perform Fuel System Pressure Release Procedure.
(3) Remove negative battery cable at battery.
(4) Remove flex tube (air cleaner housing to engine).
(5) Remove air resonator box at throttle body.
(6) Disconnect all spark plug cables from all spark plugs and ignition coils. Do not remove cables from cable routing tray. Note original cable positions while removing (Fig. 22).
(7) Remove spark plug cable tray from engine by releasing 4 retaining clips (Fig. 21). Remove tray and cables from engine as an assembly.
(8) Disconnect electrical connectors at all 8 ignition coils. Refer to Ignition Coil Removal/Installation.
(9) Disconnect fuel line latch clip and fuel line at fuel rail. A special tool will be necessary for fuel line disconnection. Refer to Quick-Connect Fittings.
(10) Disconnect electrical connectors at all 8 fuel injectors. To remove connector refer to (Fig. 17). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.
(11) Disconnect electrical connectors at all throttle body sensors.
(12) Remove 4 fuel rail mounting bolts and hold-down clamps (Fig. 20).
(13) Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in intake manifold. Gently rock and pull **right** side of rail until injectors just start to clear intake manifold head holes. Repeat this procedure (left/right) until all injectors have cleared machined holes.
(14) Remove fuel rail (with injectors attached) from engine.
(15) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

INSTALLATION

3.7L V-6

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.
(2) Clean out fuel injector machined bores in intake manifold.
(3) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.
(4) Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.
(5) Guide each injector into cylinder head. Be careful not to tear injector o-rings.
(6) Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder.

10 - #6 COIL-TO- #1 SPARK PLUG (MARKED 1/6)
11 - #4 COIL-TO- #7 SPARK PLUG (MARKED 4/7)

(7) Install 4 fuel rail mounting bolts and tighten. Refer to torque specifications.

(8) Install 6 ignition coils. Refer to Ignition Coil Removal/Installation.

(9) Connect electrical connectors to throttle body.

(10) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 17). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(11) Connect necessary vacuum lines to throttle body.

(12) Install air resonator mounting bracket near front of throttle body (2 bolts).

(13) Connect fuel line latch clip and fuel line to fuel rail. Refer to Quick-Connect Fittings.

(14) Install air box to throttle body.

(15) Install air duct to air box.

(16) Connect battery cable to battery.

(17) Start engine and check for leaks.

4.7L V-8

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.

(2) Clean out fuel injector machined bores in intake manifold.

(3) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(4) Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.

(5) Guide each injector into cylinder head. Be careful not to tear injector o-rings.

(6) Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder. Push **left** fuel rail down until injectors have bottomed on cylinder head shoulder.

(7) Install 4 fuel rail mounting bolts and tighten. Refer to torque specifications.

(8) Install 8 ignition coils. Refer to Ignition Coil Removal/Installation.

(9) Connect electrical connectors to throttle body.

(10) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 17). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(11) Connect necessary vacuum lines to throttle body.

(12) Install air resonator mounting bracket near front of throttle body (2 bolts).

(13) Connect fuel line latch clip and fuel line to fuel rail. Refer to Quick-Connect Fittings.

(14) Install air box to throttle body.

FUEL RAIL (Continued)

(15) Install air duct to air box.
(16) Connect battery cable to battery.
(17) Start engine and check for leaks.

5.7L V-8

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.
(2) Clean out fuel injector machined bores in intake manifold.
(3) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.
(4) Position fuel rail/fuel injector assembly to machined injector openings in intake manifold.
(5) Guide each injector into intake manifold. Be careful not to tear injector o-rings.
(6) Push **right** side of fuel rail down until fuel injectors have bottomed on shoulders. Push **left** fuel rail down until injectors have bottomed on shoulders.
(7) Install 4 fuel rail holdown clamps and 4 mounting bolts. Refer to Torque Specifications.
(8) Position spark plug cable tray and cable assembly to intake manifold. Snap 4 cable tray retaining clips into intake manifold.
(9) Install all cables to spark plugs and ignition coils.
(10) Connect electrical connector to throttle body.
(11) Install electrical connectors to all 8 ignition coils. Refer to Ignition Coil Removal/Installation.
(12) Connect electrical connector to throttle body.
(13) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 17). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.
(14) Connect fuel line latch clip and fuel line to fuel rail. Refer to Quick-Connect Fittings.
(15) Install air resonator to throttle body (2 bolts).
(16) Install flexible air duct to air box.
(17) Connect battery cable to battery.
(18) Start engine and check for leaks.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module, and (if equipped) certain ORVR components.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

Two check (control) valves are mounted into the top of the fuel tank. Refer to Fuel Tank Check Valve for additional information.

An evaporation control system is connected to the fuel tank to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using a Leak Detection Pump (LDP) and/or an On-Board Refueling Vapor Recovery (ORVR) system. Refer to Emission Control System for additional information.

REMOVAL- EXCEPT DIESEL

Fuel Tank Draining

WARNING: THE FUEL SYSTEM MAY BE UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. THIS PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL TANK.

Two different procedures may be used to drain fuel tank: through the fuel fill fitting on tank, or using the DRB® scan tool. Due to a one-way check valve installed into the fuel fill opening fitting at the tank, the tank cannot be drained conventionally at the fill cap.

The quickest draining procedure involves removing the rubber fuel fill hose.

As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRB scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure for procedures. Attach end of special test hose tool number 6541, 6539, 6631 or 6923 at fuel rail disconnection (tool number will depend on model and/or engine application). Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty.

If electric fuel pump is not operating, fuel must be drained through fuel fill fitting at tank. Refer to following procedures.

(1) Release fuel system pressure.
(2) Raise vehicle.
(3) Thoroughly clean area around fuel fill fitting and rubber fuel fill hose at tank.
(4) If vehicle is equipped with 4 doors and a 6 foot (short) box, remove left-rear tire/wheel.
(5) Loosen clamp (Fig. 23) and disconnect rubber fuel fill hose at tank fitting. Using an approved gas holding tank, drain fuel tank through this fitting.

FUEL TANK (Continued)

Tank Removal

(1) Loosen clamp and disconnect rubber fuel vent hose (Fig. 23) at tank fitting.

(2) Support tank with a hydraulic jack.

(3) Remove 2 fuel tank strap nuts (Fig. 24) and remove both tank support straps.

(4) Carefully lower tank a few inches and disconnect fuel pump module electrical connector (Fig. 25) at top of tank. To disconnect electrical connector: Push upward on red colored tab to unlock. Push on black colored tab while removing connector.

(5) Disconnect fuel line at fuel filter / fuel pressure regulator (Fig. 25) by pressing on tabs at side of quick-connect fitting.

(6) Disconnect EVAP line at top of tank (Fig. 1).

(7) Continue to lower tank for removal.

(8) If fuel tank is to be replaced, remove fuel pump module from tank. Refer to Fuel Pump Module Removal/Installation procedures.

INSTALLATION - EXCEPT DIESEL

(1) If fuel tank is to be replaced, install fuel pump module into tank. Refer to Fuel Pump Module Removal/Installation procedures.

(2) Disconnect clamps and remove rubber fuel fill hose and fuel vent hose at fuel fill tube. Install these 2 hoses to 2 fuel tank fittings. Rotate hoses until paint marks on hoses line up with alignment marks (Fig. 26). Tighten both clamps.

(3) Position fuel tank to hydraulic jack.

(4) Raise tank until positioned near body.

(5) Connect EVAP line at tank (Fig. 1).

(6) Connect fuel pump module electrical connector (Fig. 25) at top of tank.

(7) Connect fuel line quick-connect fitting to fuel filter / fuel pressure regulator (Fig. 1) or (Fig. 25).

(8) Continue raising tank until positioned snug to body.

(9) Install and position both tank support straps. Install 2 fuel tank strap nuts (Fig. 24) and tighten. **Tighten rear strap nut first.** Refer to Torque Specifications.

(10) Connect rubber fill and vent hoses to fuel fill tube and tighten clamps.

(11) Lower vehicle.

(12) Fill fuel tank with fuel.

(13) Start engine and check for fuel leaks near top of module.

FUEL TANK (Continued)

INLET FILTER

REMOVAL

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 27). The fuel pump module is located inside of fuel tank.

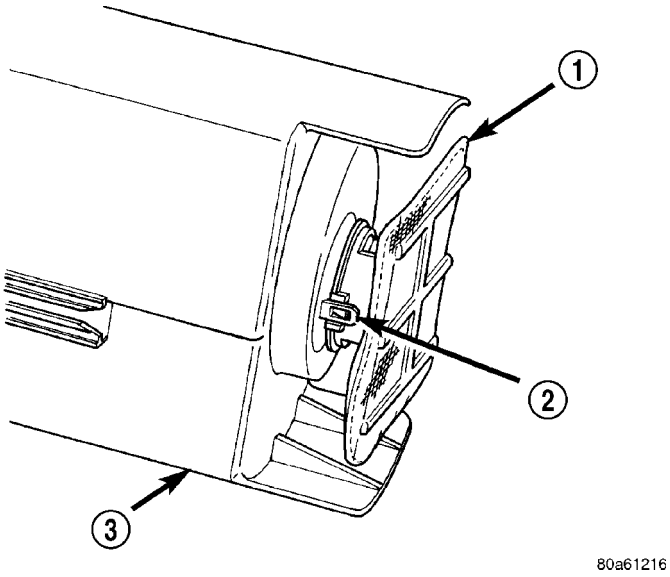

Fig. 27 FUEL PUMP INLET FILTER

1 - FUEL PUMP INLET FILTER
2 - LOCK TABS (2)
3 - FUEL PUMP MODULE (BOTTOM)

(1) Remove fuel tank. Refer to Fuel Tank Removal/ Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove filter by carefully prying 2 lock tabs at bottom of module with 2 screwdrivers. Filter is snapped to module.

(4) Clean bottom of pump module.

INSTALLATION

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 27). The fuel pump module is located inside of fuel tank.

(1) Snap new filter to bottom of module. Be sure o-ring is in correct position.

(2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Install fuel tank. Refer to Fuel Tank Removal/ Installation.

ACCELERATOR PEDAL

REMOVAL

The following procedure applies only to vehicles without the Adjustable Pedal Package (code XAP).

The accelerator pedal is serviced as a complete assembly including the bracket.

The accelerator cable is connected to the upper part of the accelerator pedal arm by a plastic retainer (clip) (Fig. 1). This plastic retainer snaps into the top of the accelerator pedal arm.

(1) From inside the vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of accelerator pedal arm (Fig. 1). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove 2 accelerator pedal mounting bracket nuts. Remove accelerator pedal assembly.

INSTALLATION

(1) Place accelerator pedal assembly over 2 studs.

(2) Install and tighten 2 mounting nuts. Refer to Torque Specifications.

(3) Slide throttle cable into opening slot in top of pedal arm.

(4) Push plastic cable retainer (clip) into accelerator pedal arm opening until it snaps into place.

(5) Before starting engine, operate accelerator pedal to check for any binding.

ACCELERATOR PEDAL (Continued)

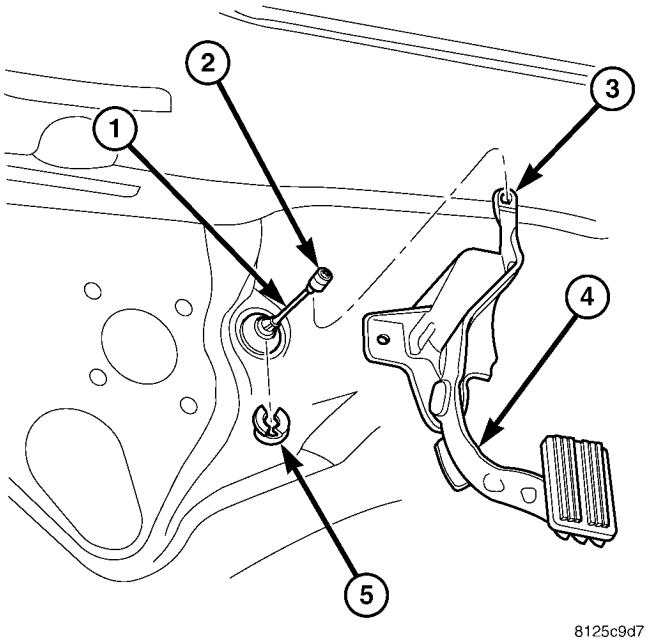

Fig. 1 ACCELERATOR PEDAL MOUNTING

1 - ACCELERATOR CABLE
2 - PLASTIC RETAINER (CLIP)
3 - THROTTLE PEDAL ARM
4 - PEDAL / BRACKET ASSEMBLY
5 - CABLE CLIP

ACCELERATOR PEDAL POSITION SENSOR

DESCRIPTION

The Accelerator Pedal Position Sensor (APPS) assembly is located under the vehicle battery tray. A cable connects the assembly to the accelerator pedal. A plastic cover with a movable door is used to cover the assembly.

The APPS is used only with the 5.7L V-8 engine.

OPERATION

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the Powertrain Control Module (PCM) with a DC voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal is translated (along with other sensors) to place the throttle plate (within the throttle body) to a pre-determined position.

A mechanical cable is used between the accelerator pedal and the APPS assembly. Although a cable is used between the pedal and APPS, a mechanical cable is not used at the throttle body. Throttle plate position is electrically determined.

REMOVAL

The APPS is serviced (replaced) as one assembly including the sensor, plastic housing and cable. The APPS assembly is located under the vehicle battery tray (Fig. 2). Access to APPS is gained from over top of left / front tire.

(1) Disconnect negative battery cable at battery.

(2) Disconnect APPS cable at accelerator pedal. Refer to Accelerator Pedal Removal / Installation.

(3) Remove wheel house liner at left / front wheel. Refer to Body.

(4) Gain access to APPS electrical connector by opening swing-down door (Fig. 3). Disconnect electrical connector.

(5) Remove 3 mounting bolts (Fig. 3).

(6) Remove APPS assembly from battery tray.

(7) If cable is to be separated at APPS, unsnap cable clip from ball socket (Fig. 4). Release cable from plastic housing by pressing on small cable release tab (Fig. 3).

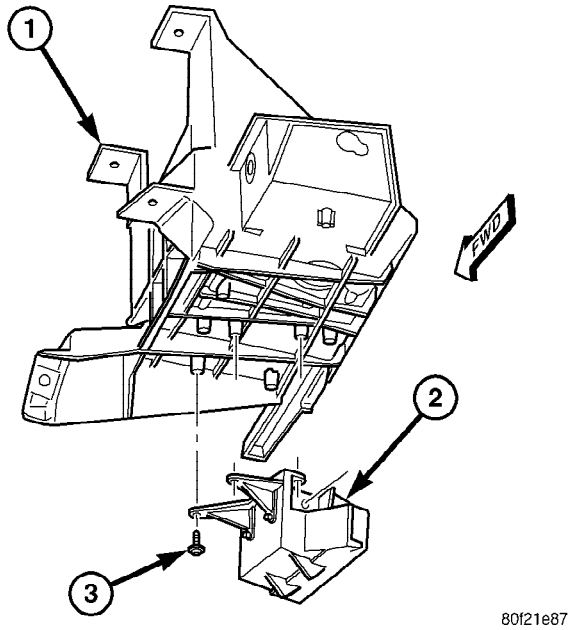

Fig. 2 APPS LOCATION

1 - BATTERY TRAY
2 - APPS LOCATION
3 - APPS MOUNTING BOLTS

INSTALLATION

(1) Install Accelerator Pedal Position Sensor (APPS) cable to accelerator pedal. Refer to Accelerator Pedal Removal / Installation.

(2) Connect electrical connector to APPS.

(3) If necessary, connect cable to APPS lever ball socket (snaps on).

(4) Snap APPS cable cover closed.

5 - CABLE

(5) Position APPS assembly to bottom of battery tray and install 3 bolts. Refer to Torque Specifications.

(6) Install wheelhouse liner. Refer to Body.

(7) **The 5.7L V-8 engine is equipped with a fully electronic accelerator pedal position sensor. If equipped with a 5.7L, also perform the following 3 steps:**

(a) Connect negative battery cable to battery.

(b) Turn ignition switch ON, but do not crank engine.

(c) Leave ignition switch ON for a minimum of 10 seconds. This will allow PCM to learn electrical parameters.

(d) The DRB III® Scan Tool may also be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Learn.

(8) If the previous step is not performed, a Diagnostic Trouble Code (DTC) will be set.

(9) If necessary, use DRB III® Scan Tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

CRANKSHAFT POSITION SENSOR

DESCRIPTION

3.7L V-6

The Crankshaft Position (CKP) sensor is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

4.7L V-8

The Crankshaft Position (CKP) sensor is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

5.7L V-8

The Crankshaft Position (CKP) sensor is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

OPERATION

3.7L V-6

Engine speed and crankshaft position are provided through the CKP (Crankshaft Position) sensor. The sensor generates pulses that are the input sent to the Powertrain Control Module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

CRANKSHAFT POSITION SENSOR (Continued)

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

A tonewheel (targetwheel) is bolted to the engine crankshaft (Fig. 5). This tonewheel has sets of notches at its outer edge (Fig. 5).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM.

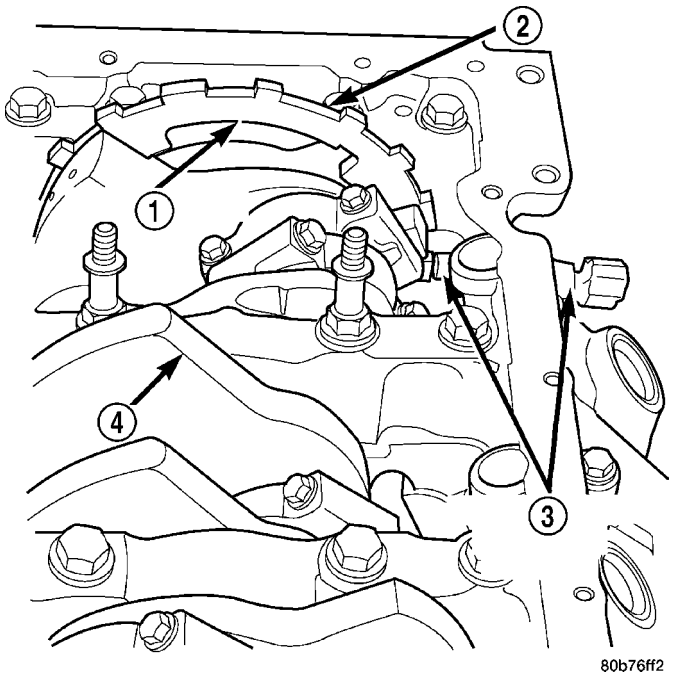

Fig. 5 CKP OPERATION - 3.7L V-6

1 - TONEWHEEL

4.7L V-8

Engine speed and crankshaft position are provided through the crankshaft position sensor. The sensor generates pulses that are the input sent to the powertrain control module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On the 4.7L V–8 engine, a tonewheel is bolted to the engine crankshaft (Fig. 6). This tonewheel has sets of notches at its outer edge (Fig. 6).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM.

(2) Apply a small amount of engine oil to sensor o-ring.

(3) Install sensor into engine block with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

(4) Install mounting bolt and tighten to 28 N·m (21 ft. lbs.) torque.

(5) Connect electrical connector to sensor.

(6) Lower vehicle.

4.7L V-8

(1) Clean out machined hole in engine block.

(2) Apply a small amount of engine oil to sensor o-ring.

(3) Install sensor into engine block with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

(4) Install mounting bolt and tighten to 28 N·m (21 ft. lbs.) torque.

(5) Connect electrical connector to sensor.

(6) Lower vehicle.

5.7L V-8

(1) Clean out machined hole in engine block.

(2) Apply a small amount of engine oil to sensor o-ring.

(3) Install sensor into engine block with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

(4) Install mounting bolt and tighten to 28 N·m (21 ft. lbs.) torque.

(5) Connect electrical connector to sensor.

(6) Lower vehicle.

FUEL INJECTOR

DESCRIPTION

An individual fuel injector (Fig. 11) is used for each individual cylinder.

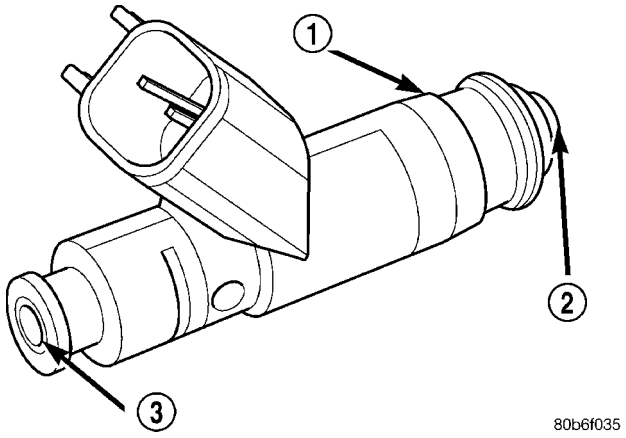

Fig. 11 FUEL INJECTOR

1 - FUEL INJECTOR
2 - NOZZLE
3 - TOP (FUEL ENTRY)

OPERATION

OPERATION - FUEL INJECTOR

The top (fuel entry) end of the injector (Fig. 11) is attached into an opening on the fuel rail.

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil

FUEL INJECTOR (Continued)

stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

OPERATION - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shutdown the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

REMOVAL

(1) Remove fuel rail. Refer to Fuel Injector Rail Removal.

(2) Disconnect clip(s) that retain fuel injector(s) to fuel rail (Fig. 12).

INSTALLATION

(1) Install fuel injector(s) into fuel rail assembly and install retaining clip(s).

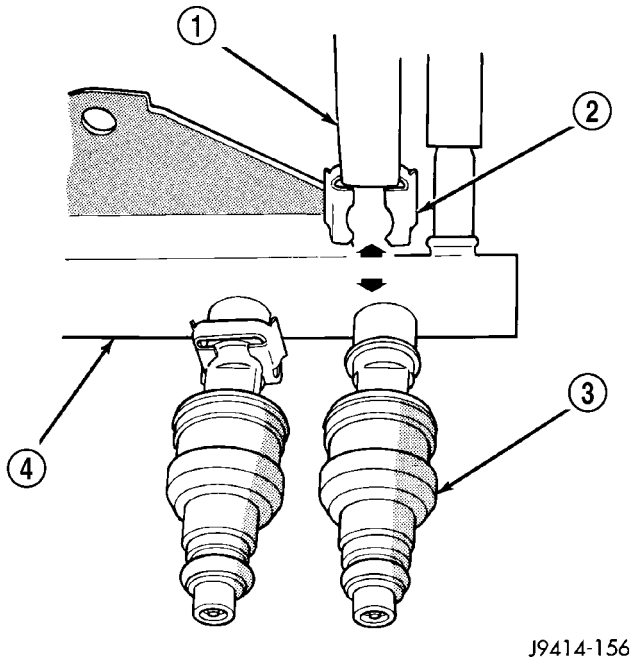

Fig. 12 INJECTOR RETAINING CLIP

1 - PLIERS
2 - INJECTOR CLIP
3 - FUEL INJECTOR - TYPICAL
4 - FUEL RAIL - TYPICAL

(2) If same injector(s) is being reinstalled, install new o-ring(s).

(3) Apply a small amount of clean engine oil to each injector o-ring. This will aid in installation.

(4) Install fuel rail. Refer to Fuel Rail Installation.

(5) Start engine and check for fuel leaks.

FUEL PUMP RELAY

DESCRIPTION

The 5–pin, 12–volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

OPERATION

The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shutdown the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

FUEL PUMP RELAY (Continued)

REMOVAL

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 13). Refer to label on PDC cover for relay location.

(1) Remove PDC cover.

(2) Remove relay from PDC.

(3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.

(4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

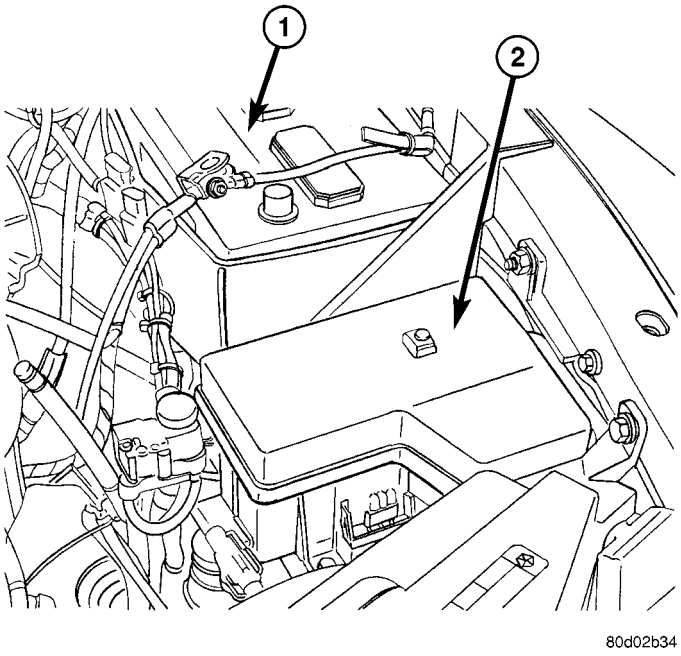

Fig. 13 PDC LOCATION

1 - BATTERY
2 - INTEGRATED POWER MODULE (IPM)

INSTALLATION

The fuel pump relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

(1) Install relay to PDC.

(2) Install cover to PDC.

IDLE AIR CONTROL MOTOR

DESCRIPTION

A separate IAC motor is not used with the 5.7L V-8 engine.

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

OPERATION

A separate IAC motor is not used with the 5.7L V-8 engine.

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

IDLE AIR CONTROL MOTOR (Continued)

IAC Stepper Motor Program: The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a ″No-Load″ engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

REMOVAL

3.7L V-6

The Idle Air Control (IAC) motor is located on the side of the throttle body (Fig. 14).

(1) Remove air resonator box at throttle body.
(2) Disconnect electrical connector from IAC motor.
(3) Remove two mounting bolts (screws).
(4) Remove IAC motor from throttle body.

4.7L V-8

The Idle Air Control (IAC) motor is located on the side of the throttle body (Fig. 15).

(1) Remove air resonator box at throttle body.
(2) Disconnect electrical connector from IAC motor.
(3) Remove two mounting bolts (screws).
(4) Remove IAC motor from throttle body.

5.7L V-8

The IAC motor is not serviceable on the 5.7L V-8 engine.

INTAKE AIR TEMPERATURE SENSOR

DESCRIPTION

The 2–wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5–volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

REMOVAL

3.7L V-6

The intake manifold air temperature (IAT) sensor is installed into the left side of intake manifold plenum (Fig. 16).

(1) Disconnect electrical connector from IAT sensor.

(2) Clean dirt from intake manifold at sensor base.

(3) Gently lift on small plastic release tab (Fig. 16) or (Fig. 17) and rotate sensor about 1/4 turn counterclockwise for removal.

(4) Check condition of sensor o-ring.

(3) Position sensor into intake manifold and rotate clockwise until past release tab.

(4) Install electrical connector.

MAP SENSOR

DESCRIPTION

3.7L V-6

The Manifold Absolute Pressure (MAP) sensor is mounted into the front of the intake manifold with 2 screws.

4.7L V-8

The Manifold Absolute Pressure (MAP) sensor is mounted into the front of the intake manifold with 2 screws.

5.7L V-8

The Manifold Absolute Pressure (MAP) sensor is mounted to the front of the intake manifold air plenum box.

OPERATION

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure

MAP SENSOR (Continued)

- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops 0.10 in. Hg. If a storm goes through, it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

REMOVAL

3.7L V-6

The Manifold Absolute Pressure (MAP) sensor is mounted into the front of the intake manifold (Fig. 21). An o-ring is used to seal the sensor to the intake manifold (Fig. 22).

(1) Disconnect electrical connector at sensor.
(2) Clean area around MAP sensor.
(3) Remove 2 sensor mounting screws.
(4) Remove MAP sensor from intake manifold.
(5) Check condition of sensor o-ring (Fig. 22).

4.7L V-8

The MAP sensor is located on the front of the intake manifold (Fig. 23). An o-ring seals the sensor to the intake manifold.

(1) Disconnect electrical connector at sensor.
(2) Clean area around MAP sensor.
(3) Remove 2 sensor mounting bolts (Fig. 23).

5.7L V-8

The Manifold Absolute Pressure (MAP) sensor is mounted to the front of the intake manifold air plenum box (Fig. 24).

(1) Disconnect electrical connector at sensor by sliding release lock out (Fig. 25). Press down on lock tab for removal.

(2) Rotate sensor 1/4 turn counter-clockwise for removal.

(3) Check condition of sensor o-ring.

INSTALLATION

3.7L V-6

The Manifold Absolute Pressure (MAP) sensor is mounted into the front of the intake manifold (Fig. 21). An o-ring is used to seal the sensor to the intake manifold (Fig. 22).

(1) Clean MAP sensor mounting hole at intake manifold.

(2) Check MAP sensor o-ring seal for cuts or tears.

(3) Position sensor into manifold.

(4) Install MAP sensor mounting bolts (screws). Refer to Torque Specifications.

(5) Connect electrical connector.

4.7L V-8

The MAP sensor is located on the front of the intake manifold (Fig. 23). An o-ring seals the sensor to the intake manifold (Fig. 22).

(1) Clean MAP sensor mounting hole at intake manifold.

(2) Check MAP sensor o-ring seal for cuts or tears.

(3) Position sensor into manifold.

MAP SENSOR (Continued)

(4) Install MAP sensor mounting bolts (screws). Refer to Torque Specifications.
(5) Connect electrical connector.

5.7L V-8

The Manifold Absolute Pressure (MAP) sensor is mounted to the front of the intake manifold air plenum box (Fig. 24).
(1) Clean MAP sensor mounting hole at intake manifold.
(2) Check MAP sensor o-ring seal for cuts or tears.
(3) Position sensor into manifold.
(4) Rotate sensor 1/4 turn clockwise for installation.
(5) Connect electrical connector.

OXYGEN SENSOR

DESCRIPTION

The Oxygen Sensors (O2S) are attached to, and protrude into the vehicle exhaust system. Depending on the engine or emission package, the vehicle may use a total of either 2 or 4 sensors.

Federal Emission Packages : Two sensors are used: upstream (referred to as 1/1) and downstream (referred to as 1/2). With this emission package, the upstream sensor (1/1) is located just before the main catalytic convertor. The downstream sensor (1/2) is located just after the main catalytic convertor.

California Emission Packages: On this emissions package, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the right upstream sensor (2/1) is located in the right exhaust downpipe just before the mini-catalytic convertor. The left upstream sensor (1/1) is located in the left exhaust downpipe just before the mini-catalytic convertor. The right downstream sensor (2/2) is located in the right exhaust downpipe just after the mini-catalytic convertor, and before the main catalytic convertor. The left downstream sensor (1/2) is located in the left exhaust downpipe just after the mini-catalytic convertor, and before the main catalytic convertor.

REMOVAL

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

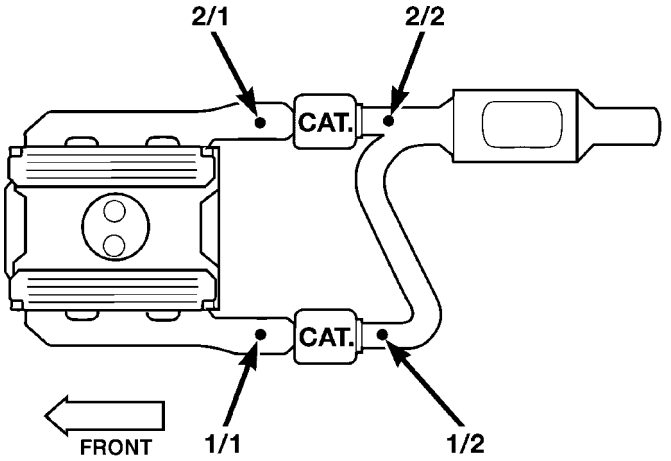
Refer to (Fig. 26) or (Fig. 27) for typical O2S (oxygen sensor) locations.

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

(1) Raise and support vehicle.
(2) Disconnect wire connector from O2S sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

(3) Remove O2S sensor with an oxygen sensor removal and installation tool.
(4) Clean threads in exhaust pipe using appropriate tap.



80bfe0e8

Fig. 27 O2 SENSOR SYSTEM - WITH 2 SENSORS

1 - POST CATALYST OXYGEN SENSOR (1/3)
2 - PRE-CATALYST OXYGEN SENSOR (1/2)

OXYGEN SENSOR (Continued)

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to threads of a new oxygen sensor.**

(1) Install O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.

(2) Connect O2S sensor wire connector.

(3) Lower vehicle.

PTO SWITCH

DESCRIPTION

This Powertrain Control Module (PCM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

OPERATION

The input is used only to tell the PCM (or ECM-Diesel) that the PTO has been engaged. The PCM (or ECM) will disable (temporarily shut down) certain OBD II diagnostic trouble codes when the PTO is engaged.

JTEC and NGC Engine Controllers: When the aftermarket PTO switch has been engaged, a 12V + signal is sent through circuit G113 to PCM pin A13. The PCM will then sense and determine that the PTO has been activated.

CM 845 or CM 848 Diesel Engine Controllers: When the aftermarket PTO switch has been engaged, a 12V + signal is sent through circuit G113 to ECM pin B38. The ECM will then sense and determine that the PTO has been activated.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

5.7L V-8 Engine:

The throttle body on the 5.7L engine is an electrically controlled unit. A mechanical cable is not used to connect the throttle body to the accelerator pedal. The Accelerator Pedal Position Sensor (APPS) along with inputs from other sensors sets the throttle blade to pre-determined positions.

Except 5.7L V-8 Engine:

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

REMOVAL

3.7L V-6

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

(1) Remove air cleaner tube at throttle body.

(2) Disconnect throttle body electrical connectors at IAC motor and TPS.

(3) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section for removal/installation procedures.

(4) Disconnect necessary vacuum lines at throttle body.

(5) Remove 3 throttle body mounting bolts (Fig. 28).

(6) Remove throttle body from intake manifold.

(7) Check condition of old throttle body-to-intake manifold o-ring (Fig. 29).

4.7L V-8

(1) Remove air duct and air resonator box at throttle body.

(2) Disconnect throttle body electrical connectors at IAC motor and TPS (Fig. 30).

(3) Remove vacuum line at throttle body.

(4) Remove all control cables from throttle body (lever) arm. Refer to Accelerator Pedal and Throttle Cable.

(5) Remove three throttle body mounting bolts (Fig. 30).

(6) Remove throttle body from intake manifold.

5.7L V-8

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

(1) Remove air duct and air resonator box at throttle body.

THROTTLE BODY (Continued)

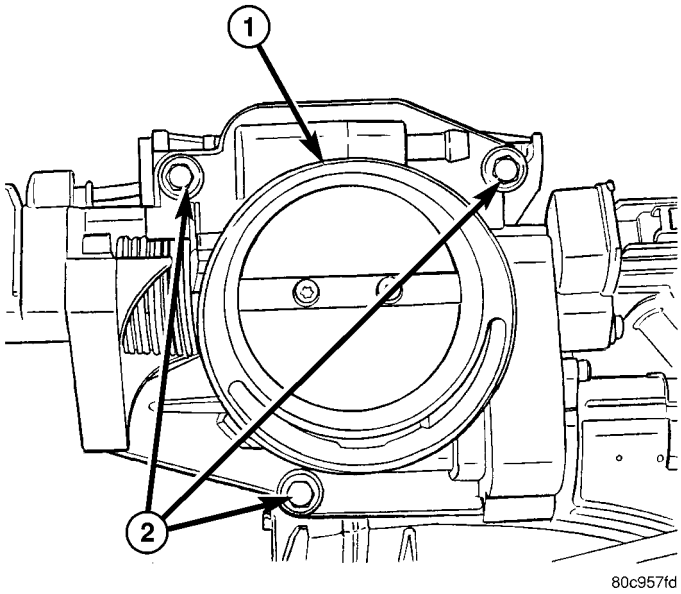

Fig. 28 THROTTLE BODY MOUNTING BOLTS - 3.7L V-6

1 - THROTTLE BODY
2 - MOUNTING BOLTS (3)

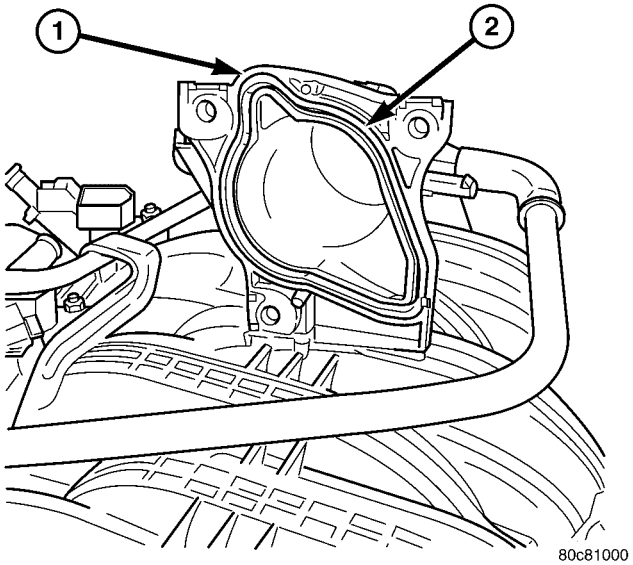

Fig. 29 THROTTLE BODY O-RING - 3.7L V-6

1 - INTAKE MANIFOLD
2 - THROTTLE BODY O-RING

(2) Disconnect electrical connector at throttle body (Fig. 31).

(3) Remove 4 throttle body mounting bolts (Fig. 31).

(4) Remove throttle body from intake manifold.

(5) Check condition of throttle body o-ring (Fig. 32).

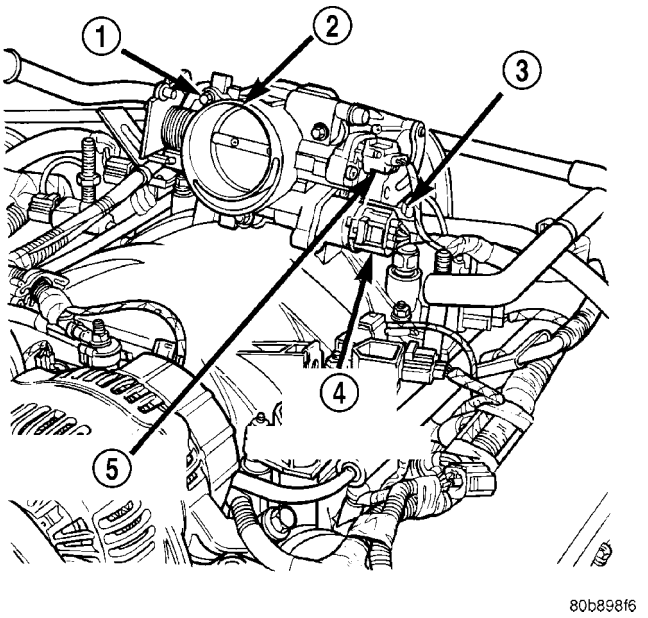

Fig. 30 THROTTLE BODY MOUNTING BOLTS - 4.7L V-8

1 - MOUNTING BOLTS (3)
2 - THROTTLE BODY
3 - IAT SENSOR CONNECTOR
4 - IAC MOTOR CONNECTOR
5 - TPS CONNECTOR

(6) If the throttle body has been changed, the following procedure must be performed:

(a) Disconnect negative battery cable from battery. Leave cable disconnected for approximately 90 seconds.

(b) Reconnect cable to battery.

(c) Turn ignition switch ON, but do not crank engine.

(d) Leave ignition switch ON for a minimum of 10 seconds. This will allow PCM to learn throttle body electrical parameters.

INSTALLATION

3.7L V-6

(1) Check condition of throttle body-to-intake manifold o-ring. Replace as necessary.

(2) Clean mating surfaces of throttle body and intake manifold.

(3) Install throttle body-to-intake manifold o-ring.

(4) Install throttle body to intake manifold.

(5) Install 3 mounting bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.

(6) Install control cables.

(7) Install electrical connectors.

(8) Install necessary vacuum lines.

(9) Install air plenum.

THROTTLE BODY (Continued)

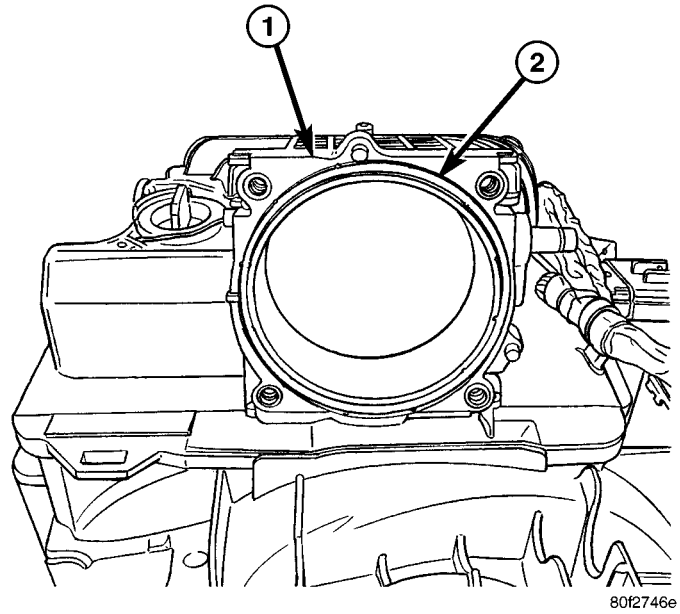

Fig. 32 5.7L V-8 THROTTLE BODY O-RING

1 - INTAKE MANIFOLD
2 - THROTTLE BODY O-RING

4.7L V-8

(1) Clean throttle body-to-intake manifold o-ring.
(2) Clean mating surfaces of throttle body and intake manifold.
(3) Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
(4) Install three mounting bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.
(5) Install control cables.
(6) Install vacuum line to throttle body.
(7) Install electrical connectors.
(8) Install air plenum.

5.7L V-8

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

(1) Clean and check condition of throttle body-to-intake manifold o-ring.
(2) Clean mating surfaces of throttle body and intake manifold.
(3) Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
(4) Install 4 mounting bolts. Refer to Torque Specifications.
(5) Install electrical connector.
(6) Install air plenum.
(7) **If the throttle body has been changed, the following procedure must be performed:**
(a) Disconnect negative battery cable from battery. Leave cable disconnected for approximately 90 seconds.
(b) Reconnect cable to battery.
(c) Turn ignition switch ON, but do not crank engine.
(d) Leave ignition switch ON for a minimum of 10 seconds. This will allow PCM to learn throttle body electrical parameters.

THROTTLE CONTROL CABLE

REMOVAL

3.7L V-6

CAUTION: Be careful not to damage or kink cable core wire (within cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm (Fig. 1). Plastic cable retainer snaps into top of pedal arm.
(2) Remove cable core wire at pedal arm.
(3) From inside vehicle, remove metal clip holding cable to dashpanel (Fig. 1).

THROTTLE CONTROL CABLE (Continued)

(4) Remove air resonator box at throttle body.
(5) Unsnap cable from dashpanel routing clip.
(6) Remove cable housing from dash panel and pull into engine compartment.
(7) Hold throttle in wide open position. While held in this position, slide throttle cable pin (Fig. 33) from throttle body bellcrank.
(8) Using a pick or small screwdriver, press release tab (Fig. 34) to release plastic cable mount from bracket. **Press on tab only enough to release cable from bracket. If tab is pressed too much, it will be broken.** Slide plastic mount (Fig. 34) towards right side of vehicle to remove throttle cable from throttle body bracket.
(9) Remove throttle cable from vehicle.

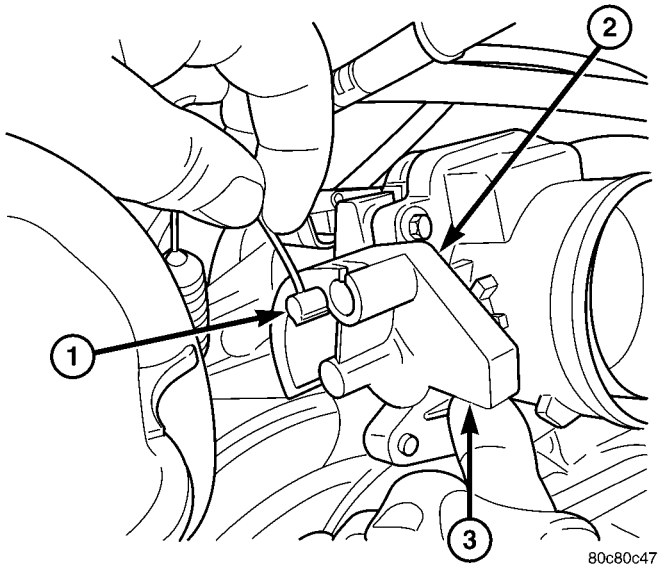

Fig. 33 THROTTLE CABLE PIN - 3.7L V-6

3 - PUSH UP HERE

4.7L V-8

CAUTION: Be careful not to damage or kink cable core wire (within cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm (Fig. 1). Plastic cable retainer (clip) snaps into pedal arm.
(2) Remove cable core wire at pedal arm.
(3) From inside vehicle, remove cable clip holding cable to dashpanel (Fig. 1).
(4) Remove air box at throttle body.
(5) Unsnap cable from dashpanel routing clip.
(6) Remove cable housing from dash panel and pull into engine compartment.

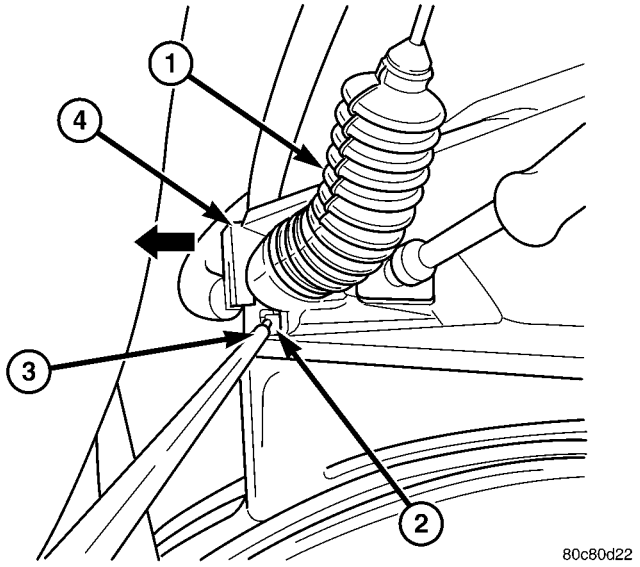

Fig. 34 THROTTLE CABLE RELEASE TAB - 3.7L V-6

1 - THROTTLE CABLE
2 - RELEASE TAB
3 - PICK OR SCREWDRIVER
4 - PLASTIC CABLE MOUNT

(7) Using finger pressure only, disconnect accelerator cable connector at throttle body bellcrank pin by pushing connector off bellcrank pin towards front of vehicle (Fig. 35). **DO NOT try to pull connector off perpendicular to bellcrank pin. Connector will be broken.**
(8) Lift accelerator cable from top of cable cam (Fig. 35).
(9) Press tab (Fig. 36) to release plastic cable mount from bracket. **Press on tab only enough to release cable from bracket. If tab is pressed too much, it will be broken.** Slide plastic mount (Fig. 36) towards passenger side of vehicle to remove cable from bracket.
(10) Remove throttle cable from vehicle.

5.7L V-8

The Throttle Control Cable on the 5.7L V-8 engine connects the accelerator pedal to the Accelerator Pedal Position Sensor (APPS). A separate mechanical cable is not routed to the throttle body.

CAUTION: Be careful not to damage or kink cable core wire (within cable sheathing) while servicing accelerator pedal, cables or APPS.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 1). The plastic cable retainer snaps into pedal arm.
(2) Remove cable core wire at pedal arm.

THROTTLE CONTROL CABLE (Continued)

4 - OFF
5 - ACCELERATOR CABLE CONNECTOR
6 - CABLE CAM
7 - BELLCRANK

(3) Remove APPS. Refer to Accelerator Pedal Position Sensor (APPS) Removal / Installation.

(4) From inside vehicle, remove cable clip (Fig. 1).

(5) Remove cable housing from dash panel and pull cable into engine compartment.

(6) Remove cable housing at APPS bracket by pressing on release tab with a small screwdriver. **To prevent cable housing breakage, press on tab only enough to release cable from APPS bracket.**

INSTALLATION

3.7L V-6

(1) Slide accelerator cable plastic mount into throttle body mounting bracket. Continue sliding until release tab (Fig. 34) is aligned to hole in mounting bracket.

(2) Hold throttle in wide open position. While held in this position, slide throttle cable pin (Fig. 33) into throttle body bellcrank.

(3) Push cable housing into rubber grommet and through opening in dash panel.

(4) From inside vehicle, install metal clip holding cable to dashpanel (Fig. 1).

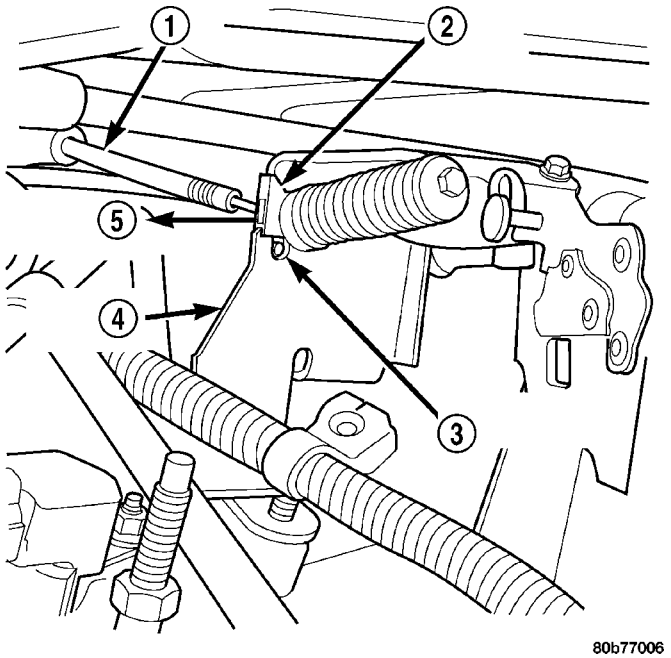

Fig. 36 ACCELERATOR CABLE RELEASE TAB - 4.7L V-8

1 - ACCELERATOR CABLE
2 - PLASTIC CABLE MOUNT
3 - PRESS TAB FOR REMOVAL
4 - CABLE BRACKET
5 - SLIDE FOR REMOVAL

(5) From inside vehicle, slide throttle cable core wire into opening (slot) in top of pedal arm.

(6) Push plastic cable retainer (clip) into pedal arm opening until it snaps in place.

(7) Install air resonator tube to throttle body.

(8) Before starting engine, operate accelerator pedal to check for any binding.

4.7L V-8

(1) Slide accelerator cable plastic mount into bracket. Continue sliding until tab (Fig. 36) is aligned to hole in mounting bracket.

(2) Route accelerator cable over top of cable cam.

(3) Connect cable end to throttle body bellcrank pin (snaps on rearward).

(4) Slide rubber grommet away from plastic cable housing.

(5) Install rubber grommet into dash panel until seated.

(6) Push cable housing into rubber grommet and through opening in dash panel.

(7) From inside vehicle, install clip holding cable to dashpanel (Fig. 1).

(8) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.

(9) Push cable retainer (clip) into pedal arm opening until it snaps in place.

(10) Snap cable into dashpanel routing clip.

THROTTLE CONTROL CABLE (Continued)

(11) Install air resonator tube to throttle body.
(12) Before starting engine, operate accelerator pedal to check for any binding.

5.7L V-8

(1) Attach cable to Accelerator Pedal Position Sensor (APPS). Refer to APPS Removal / Installation.
(2) Push cable housing into rubber grommet and through opening in dash panel.
(3) From inside vehicle, install clip holding cable to dashpanel (Fig. 1).
(4) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.
(5) Push cable retainer (clip) into pedal arm opening until it snaps in place.
(6) Before starting engine, operate accelerator pedal to check for any binding.
(7) If necessary, use DRB III® Scan Tool to erase any APPS Diagnostic Trouble Codes (DTC's) from PCM.

THROTTLE POSITION SENSOR

DESCRIPTION

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade shaft.

The 5.7L V-8 engine does not use a separate TPS on the throttle body.

OPERATION

The 5.7L V-8 engine does not use a separate Throttle Position Sensor (TPS) on the throttle body.

The 3–wire TPS provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
- Deceleration fuel lean out
- Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
- A/C WOT cutoff (certain automatic transmissions only)

REMOVAL

3.7L V6

The Throttle Position Sensor (TPS) is mounted to the throttle body (Fig. 37), or (Fig. 38).

(1) Remove air resonator tube at throttle body.
(2) Disconnect TPS electrical connector.
(3) Remove 2 TPS mounting screws.
(4) Remove TPS.

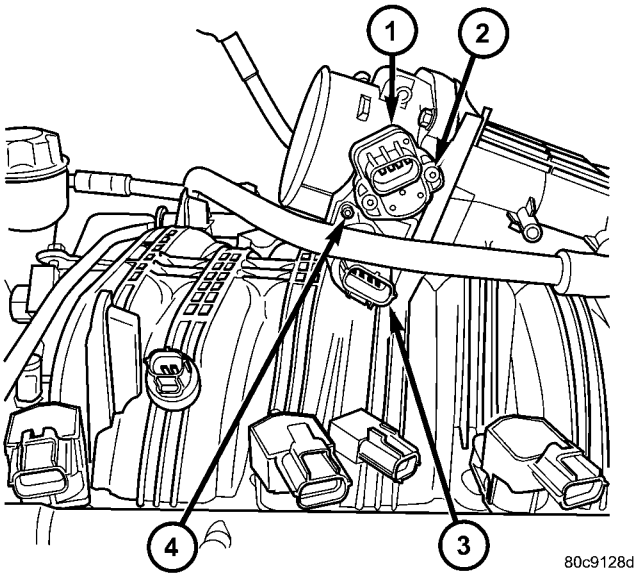

Fig. 37 TPS LOCATION - 3.7L V-6

1 - THROTTLE POSITION SENSOR (TPS)
2 - MOUNTING SCREWS

THROTTLE POSITION SENSOR (Continued)

INSTALLATION

3.7L V-6

The Throttle Position Sensor (TPS) is mounted to the throttle body (Fig. 37).

The throttle shaft end of throttle body slides into a socket in TPS (Fig. 40). The TPS must be installed so that it can be rotated a few degrees. (If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs). The TPS will be under slight tension when rotated.

(1) Install TPS and retaining screws.
(2) Tighten screws to 7 N·m (60 in. lbs.) torque.
(3) Connect TPS electrical connector to TPS.
(4) Manually operate throttle (by hand) to check for any TPS binding before starting engine.
(5) Install air cleaner tube to throttle body.

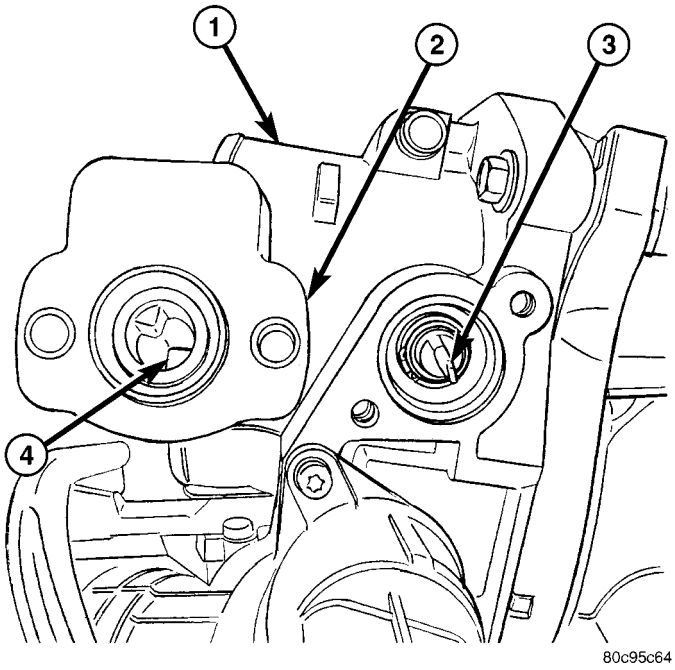

Fig. 40 TPS INSTALLATION - 3.7L

1 - THROTTLE BODY
2 - TPS
3 - THROTTLE BODY SHAFT
4 - SOCKET LOCATING TANGS

4.7L V-8

The throttle shaft end of throttle body slides into a socket in TPS (Fig. 41). The TPS must be installed so that it can be rotated a few degrees. If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs. The TPS will be under slight tension when rotated.

(1) Install TPS and two retaining bolts.
(2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
(3) Manually operate throttle control lever by hand to check for any binding of TPS.
(4) Connect TPS electrical connector to TPS.
(5) Install air duct/air box to throttle body.

FUEL DELIVERY - DIESEL

DESCRIPTION - DIESEL FUEL SYSTEM

The fuel system used on the Cummins engine is an electronically controlled, Bosch HPCR (High-Pressure Common Rail) system. The HPCR system consists of five main components:

- Electric Fuel Transfer (lift) Pump
- Fuel Pump/Gear Pump (attached to fuel injection pump)
- High-Pressure Fuel Injection Pump
- Fuel Injection Rail
- Fuel Injectors

Also to be considered as part of the overall fuel system are:

- Accelerator Pedal
- Air Cleaner Housing/Element
- Fuel Drain Manifold (passage)
- Fuel Drain Valve (at filter)
- Fuel Filter/Water Separator
- Fuel Heater
- Fuel Heater Relay
- Fuel Level (gauge) Sending Unit
- Fuel Pressure Limiting Valve
- Fuel Tank
- Fuel Tank Module (containing fuel gauge sending unit and separate fuel filter located at bottom of tank module)
- Fuel Tank Filler/Vent Tube Assembly
- Fuel Tank Filler Tube Cap
- Fuel Tubes/Lines/Hoses
- High-Pressure Fuel Injector Lines
- In-Tank Fuel Filter (at bottom of fuel tank module)
- Low-Pressure Fuel Supply Lines
- Low-Pressure Fuel Return Line
- Overflow Valve
- Quick-Connect Fuel Line Fittings
- Throttle Cable
- Water Draining (maintenance)
- Water-In-Fuel (WIF) Sensor

The fuel injection pump supplies high pressure to the fuel rail independent of engine speed. This high pressure fuel is then accumulated in the fuel rail. High pressure fuel is constantly supplied to the injectors by the fuel rail. The Engine Control Module (ECM) controls the fueling and timing of the engine by actuating the injectors.

Fuel enters the system from the electric fuel transfer (lift) pump, which is attached to the fuel filter assembly. Fuel is forced through the fuel filter element and then enters the Fuel Pump/Gear Pump, which is attached to the rear of the fuel injection pump. The Fuel Pump/Gear Pump is a low-pressure pump and produce pressures ranging from 551.5 kpa (80 psi) to 1241 kpa (180) psi. Fuel then enters the fuel injection pump. Low pressure fuel is then supplied to the FCA (Fuel Control Actuator).

The FCA is an electronically controlled solenoid valve. The ECM controls the amount of fuel that enters the high-pressure pumping chambers by opening and closing the FCA based on a demanded fuel pressure. The FPS (Fuel Pressure Sensor) on the fuel rail monitors the actual fuel pressure and provides it as an input to the ECM. When the actuator is opened, the maximum amount of fuel is being supplied to the fuel injection pump. Any fuel that does not enter the injection pump is directed to the overflow valve. The overflow valve regulates how much excess fuel is used for lubrication of the pump and how much is returned to the tank through the drain manifold.

Fuel entering the injection pump is pressurized to between 300-1600 bar (4351-23,206 psi) by three radial pumping chambers. The pressurized fuel is then supplied to the fuel rail.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 160,000 KPA (23,206 PSI). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Certain fuel system components can be found in (Fig. 1), or (Fig. 2).

STANDARD PROCEDURE

STANDARD PROCEDURES - WATER DRAINING AT FUEL FILTER

Refer to Fuel Filter/Water Separator removal/installation for procedures.

STANDARD PROCEDURES - CLEANING FUEL SYSTEM PARTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

STANDARD PROCEDURE - FUEL SYSTEM PRIMING

A certain amount of air becomes trapped in the fuel system when fuel system components on the supply and/or high-pressure side are serviced or replaced. Fuel system priming is accomplished using the electric fuel transfer (lift) pump.

Servicing or replacing fuel system components will not require fuel system priming.

The fuel transfer (lift) pump is self-priming: When the key is first turned on (without cranking engine), the pump operates for approximately 1 to 2 second and then shuts off. The pump will also operate for up to 25 seconds after the starter is quickly engaged, and then disengaged without allowing the engine to start. The pump shuts off immediately if the key is on and the engine stops running.

(1) Turn key to CRANK position and quickly release key to ON position before engine starts. This will operate fuel transfer pump for approximately 25 seconds.

(2) Crank engine. If the engine does not start after 25 seconds, turn key OFF. Repeat previous step until engine starts.

(3) Fuel system priming is now completed.

(4) Attempt to start engine. If engine will not start, proceed to following steps. **When engine does start, it may run erratically and be noisy for a few minutes. This is a normal condition.**

CAUTION: Do not engage the starter motor for more than 30 seconds at a time. Allow two minutes between cranking intervals.

(5) Perform previous fuel priming procedure steps using fuel transfer pump. Be sure fuel is present at fuel tank.

(6) Crank the engine for 30 seconds at a time to allow fuel system to prime.

WARNING: THE FUEL INJECTION PUMP SUPPLIES EXTREMELY HIGH FUEL PRESSURE TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. DO NOT LOOSEN FUEL FITTINGS WHILE ENGINE IS RUNNING.

WARNING: ENGINE MAY START WHILE CRANKING STARTER MOTOR.

FUEL FILTER / WATER SEPARATOR

DESCRIPTION

The fuel filter/water separator assembly is located on left side of engine above the starter motor. The assembly also includes the fuel heater, Water-In-Fuel (WIF) sensor, and fuel transfer pump.

OPERATION

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

Refer to the maintenance schedules in the owners manual for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator Removal/Installation section.

A Water-In-Fuel (WIF) sensor is attached to the side of fuel filter housing. Refer to Water-In-Fuel Sensor Description/Operation.

The fuel heater is installed into the top of the filter/separator housing. Refer to Fuel Heater Description/Operation.

REMOVAL

Refer to maintenance schedules in this manual, or the owners manual for recommended fuel filter replacement intervals.

Draining water from fuel filter/water separator housing:

The housing drain valve (Fig. 3) serves two purposes. One is to **partially** the drain filter housing of excess water. The other is to **completely** the drain housing for fuel filter, drain valve, heater element, , water-in-fuel sensor replacement or transfer pump replacement.

The filter housing should be partially drained whenever the water-in-fuel warning lamp remains illuminated. (Note that lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

(1) A drain hose (Fig. 3) is located at the bottom of drain valve. Place drain pan under drain hose.

(2) **With engine not running,** rotate drain valve handle counter-clockwise (rearward) to OPEN (DRAIN) position. Hold drain valve open until all water and contaminants have been removed and clean fuel exits.

(3) If drain valve, fuel heater element or Water-In-Fuel (WIF) sensor is being replaced, drain housing completely. Dispose of mixture in drain pan according to applicable regulations.

(4) After draining operation, rotate valve handle clockwise (forward) to the CLOSE position.

(5) **Fuel Filter Replacement:** The fuel filter is located inside of the fuel filter housing.

(a) Clean all debris from around canister.

(b) Remove filter lid (Fig. 4) using a socket. Attach socket to large hex on top of lid (Fig. 4). Rotate counter-clockwise for removal. Remove o-ring. Discard o-ring.

(c) Remove filter element by twisting element sideways from filter lid.

(6) **Water-In-Fuel (WIF) Sensor Replacement:** The WIF sensor is located on the side of the fuel filter housing (Fig. 3).

(a) Disconnect electrical connector at sensor.

(b) Clean area around sensor.

(c) Remove sensor by rotating counter-clockwise.

(d) Check condition of sensor o-ring. Replace if damaged.

(7) **Fuel Heater Element Replacement:** The heater element is located in the fuel filter housing (Fig. 3).

(a) Remove fuel filter. See previous steps.

(b) Disconnect electrical connector.

(c) Remove two T-15 Torx head mounting screws from fuel heater element.

(d) Remove fuel heater.

(8) **Drain Valve Replacement:** The drain valve assembly is located on the side of the fuel filter housing (Fig. 3).

(a) Disconnect drain hose from the fuel drain valve.

(b) Remove 4 drain valve mounting screws (T-15 Torx head).

(c) Remove drain valve from filter housing.

INSTALLATION

Refer to maintenance schedules for recommended fuel filter replacement intervals.

(1) Thoroughly clean inside of filter housing, filter cap and all related components.

(2) **Fuel Filter:**

(a) **The engine has a self-priming low-pressure fuel system. Refer to Standard Procedures-Fuel System Priming.**

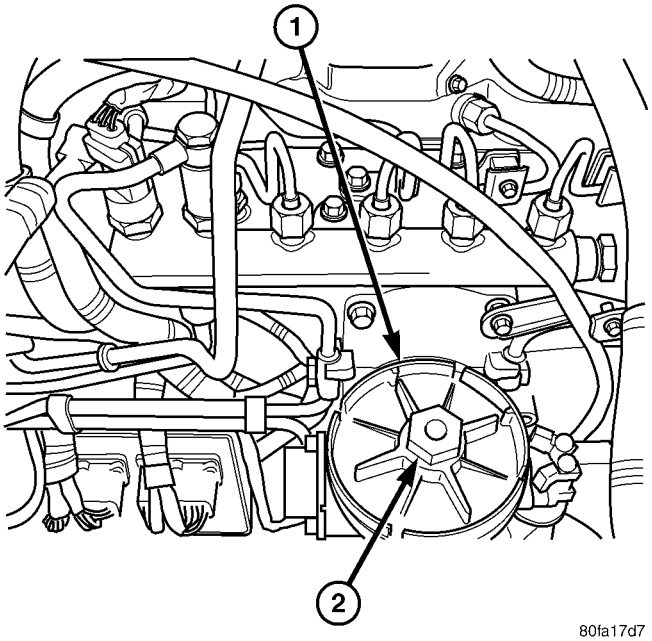

Fig. 4 FILTER COVER (LID)

1 - FILTER COVER
2 - ATTACH SOCKET HERE

(b) Install new o-ring to canister lid and lubricate o-ring with clean engine oil.

(c) Position new element to canister lid. Place this assembly into canister by rotating clockwise.

(d) Tighten cap to 34 N·m (25 ft. lbs.) torque. Do not overtighten cap.

(3) **Water-In-Fuel (WIF) Sensor:**

(a) Install new o-ring seal to WIF sensor.

(b) Apply a light film of clean oil to o-ring seal.

(c) Install sensor into housing.

(d) Tighten sensor to 2.5 N·m (25 in. lbs.) torque.

(e) Connect electrical connector to WIF sensor.

(4) **Fuel Heater Element:**

(a) Install fuel heater into fuel filter housing.

(b) Install fuel heater thermostat into fuel filter housing.

(c) Install fuel heater mounting screws and tighten to 1-1.5 N·m (13 in. lbs.) torque.

(d) Connect electrical connector to fuel heater thermostat.

(e) Install new filter cover O-ring onto fuel filter housing cover and lubricate with clean engine oil.

(f) Tighten fuel filter housing cover (lid) to 34 N·m (25 ft. lbs.).

(5) **Drain Valve:**

(a) Install 2 new o-rings to valve and filter housing.

(b) Lubricate with silicon grease.

(c) Install fuel drain valve.

(d) Install 4 mounting screws and tighten to 1–1.5 N·m (8–13 in. lbs.) torque.

(e) Connect drain hose to drain valve.

(6) Start engine and check for leaks.

FUEL HEATER

DESCRIPTION

The fuel heater assembly is located on the side of the fuel filter housing (Fig. 3).

The heater/element assembly is equipped with a temperature sensor (thermostat) that senses fuel temperature. This sensor is attached to the fuel heater/element assembly.

OPERATION

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

When the temperature is below 45 ±8 degrees F, the temperature sensor allows current to flow to the heater element warming the fuel. When the temperature is above 75 ±8 degrees F, the sensor stops current flow to the heater element.

Battery voltage to operate the fuel heater element is supplied from the ignition switch and through the fuel heater relay. Also refer to Fuel Heater Relay.

FUEL HEATER (Continued)

The fuel heater element and fuel heater relay are not computer controlled.

The heater element operates on 12 volts, 300 watts at 0 degrees F.

DIAGNOSIS AND TESTING - FUEL HEATER

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

NOTE: The fuel heater element, fuel heater relay and fuel heater temperature sensor are not controlled by the Engine Control Module (ECM).

A malfunctioning fuel heater can cause a wax build-up in the fuel filter/water separator. Wax build-up in the filter/separator can cause engine starting problems and prevent the engine from revving up. It can also cause blue or white fog-like exhaust. If the heater is not operating in cold temperatures, the engine may not operate due to fuel waxing.

The fuel heater assembly is located on the side of fuel filter housing.

The heater assembly is equipped with a built-in fuel temperature sensor (thermostat) that senses fuel temperature. When fuel temperature drops below 45 degrees ± 8 degrees F, the sensor allows current to flow to built-in heater element to warm fuel. When fuel temperature rises above 75 degrees ± 8 degrees F, the sensor stops current flow to heater element (circuit is open).

Voltage to operate fuel heater element is supplied from ignition switch, through fuel heater relay (also refer to Fuel Heater Relay), to fuel temperature sensor and on to fuel heater element.

The heater element operates on 12 volts, 300 watts at 0 degrees F. As temperature increases, power requirements decrease.

A minimum of 7 volts is required to operate the fuel heater. The resistance value of the heater element is less than 1 ohm (cold) and up to 1000 ohms warm.

TESTING

(1) Disconnect electrical connector from thermostat (Fig. 3).

Ambient temperature must be below the circuit close temperature. If necessary, induce this ambient temperature by placing ice packs on thermostat to produce an effective ambient temperature below circuit close temperature.

Measure resistance across two pins. Operating range is 0.3 — 0.45 Ohms.

(2) If resistance is out of range, remove thermostat and check resistance across terminal connections of heater. The heater can be checked at room temperature. Operating range is 0.3 - 0.45 Ohms.

(3) Replace heater if resistance is not within operating range.

(4) If heater is within operating range, replace heater thermostat.

REMOVAL

REMOVAL/INSTALLATION

The fuel heater/element/sensor assembly is located inside of the fuel filter housing. Refer to Fuel Filter/Water Separator Removal/Installation for procedures.

FUEL HEATER RELAY

DESCRIPTION

The fuel heater relay is located in Power Distribution Center (PDC) (Fig. 5). Refer to label on inside of PDC cover for relay location.

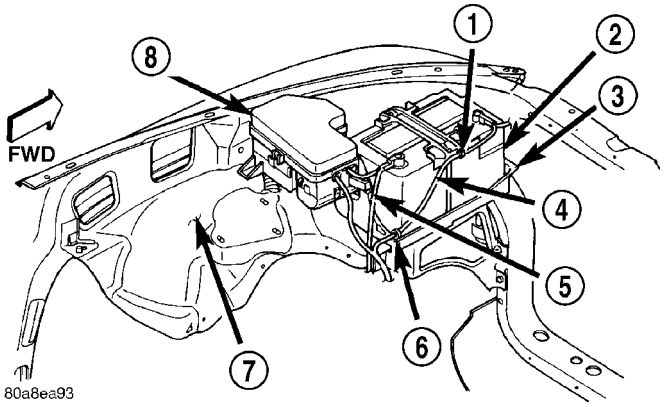

Fig. 5 POWER DISTRIBUTION CENTER LOCATION

1 - CLIP
2 - BATTERY
3 - TRAY
4 - NEGATIVE CABLE
5 - POSITIVE CABLE
6 - CLIP
7 - FENDER INNER SHIELD
8 - POWER DISTRIBUTION CENTER

OPERATION

Battery voltage to operate the fuel heater element is supplied from the ignition switch through the fuel heater relay. **The fuel heater element and fuel heater relay are not computer controlled.**

REMOVAL

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 6). Refer to label under PDC cover for relay location.

(1) Remove PDC cover.

(2) Remove relay from PDC.

FUEL HEATER RELAY (Continued)

(3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.

(4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

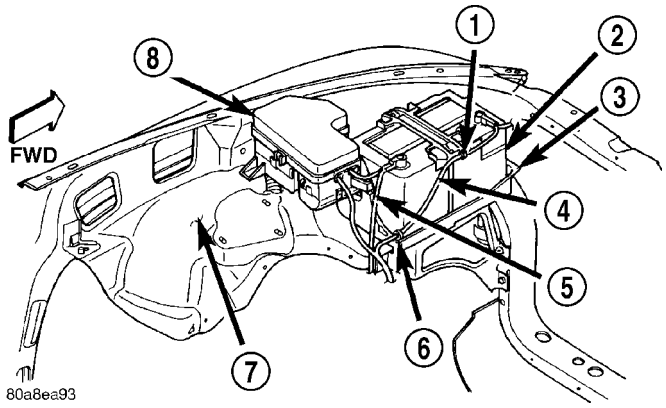

Fig. 6 POWER DISTRIBUTION CENTER LOCATION

1 - CLIP
2 - BATTERY
3 - TRAY
4 - NEGATIVE CABLE
5 - POSITIVE CABLE
6 - CLIP
7 - FENDER INNER SHIELD
8 - POWER DISTRIBUTION CENTER

INSTALLATION

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 6). Refer to label under PDC cover for relay location.

(1) Install relay to PDC.

(2) Install cover to PDC.

FUEL INJECTION PUMP

DESCRIPTION

A Robert Bosch high-pressure fuel injection pump is used. The pump is attached to the back of the timing gear cover at the left / rear side of the engine.

OPERATION

The fuel injection pump supplies high pressure to the fuel rail independent of engine speed. This high pressure is then accumulated in the fuel rail. High pressure fuel is constantly supplied to the injectors by the fuel rail. The Engine Control Module (ECM) controls the fueling and timing of the engine by actuating the injectors.

Fuel enters the system from the electric fuel transfer (lift) pump, which is attached to the fuel filter assembly. Fuel is forced through the fuel filter element and then enters the Fuel Pump/Gear Pump, which is attached to the rear of the fuel injection pump. The Fuel Pump/Gear Pump is a low-pressure pump and produce pressures ranging from 551.5 kpa (80 psi) to 1241 kpa (180) psi. Fuel then enters the fuel injection pump. Low pressure fuel is then supplied to the FCA (Fuel Control Actuator).

The FCA is an electronically controlled solenoid valve. The ECM controls the amount of fuel that enters the high-pressure pumping chambers by opening and closing the FCA based on a demanded fuel pressure. The FPS (Fuel Pressure Sensor) on the fuel rail provides the actual fuel pressure. When the actuator is opened, the maximum amount of fuel is being supplied to the fuel injection pump. Any fuel that does not enter the injection pump is directed to the cascade overflow valve. The cascade overflow valve regulates how much excess fuel is used for lubrication of the pump and how much is returned to the tank through the drain manifold.

Fuel entering the injection pump is pressurized to between 300-1600 bar (4351-23206 psi) by three radial pumping chambers. The pressurized fuel is then supplied to the fuel rail.

DIAGNOSIS AND TESTING - FUEL INJECTION PUMP TIMING

With the Bosch injection pump, there are no mechanical adjustments needed or necessary to accomplish fuel injection timing. All timing and fuel adjustments are electrically made by the engine mounted Engine Control Module (ECM).

FUEL INJECTION PUMP (Continued)

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

(1) Disconnect both negative battery cables at both batteries. Cover and isolate ends of both cables.

(2) Remove intake manifold air intake tube (above injection pump) and its rubber connector hose (Fig. 7).

(3) Remove accessory drive belt.

(4) Thoroughly clean the rear of injection pump, and attachment points for its 3 fuel lines (Fig. 8). Also clean the opposite ends of these same 3 lines at their attachment points.

(5) Disconnect Fuel Control Actuator (FCA) electrical connector at rear of injection pump (Fig. 9).

CAUTION: Whenever a fuel line fitting is connected to a secondary fitting, always use a back-up wrench on the secondary fitting. Do not allow the secondary fitting to rotate.

(6) Remove fuel line (injection pump-to-fuel pressure limiting valve).

(7) Remove fuel line (injection pump-to-fuel rail). Use back-up wrench on fitting at fuel pump.

(8) Remove fuel line (injection pump-to-fuel filter housing).

(9) Remove fuel pump drive gear access cover (plate) with a 3/8” drive ratchet. Plate is threaded to timing gear cover (Fig. 10).

(10) Remove fuel pump drive gear mounting nut and washer.

(11) Attach C3428B, or L4407A (or equivalent) gear puller (Fig. 11) to pump drive gear with 2 bolts, and separate gear from pump (a keyway is not used on this particular injection pump). Leave drive gear hanging loose within timing gear cover.

(12) Remove 3 injection pump mounting nuts (Fig. 12), and remove pump from engine.

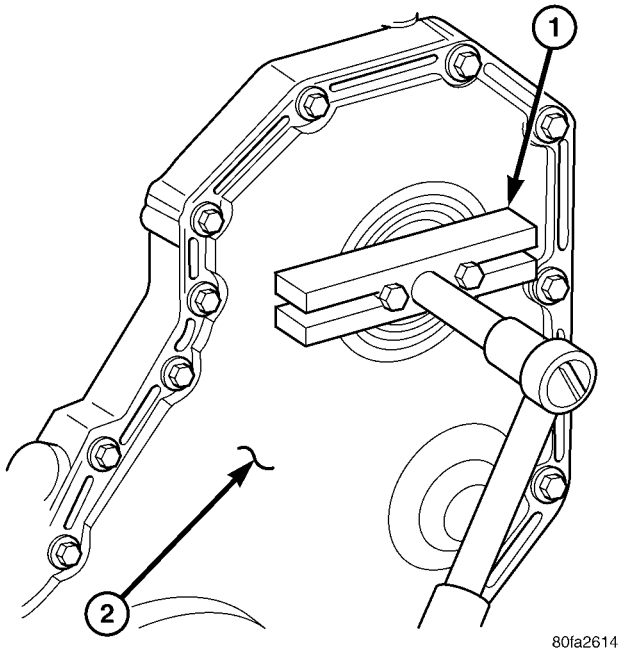

Fig. 11 DRIVE GEAR REMOVAL

1 - FRONT TIMING GEAR COVER
2 - GEAR PULLER TOOL

INSTALLATION

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

(1) Inspect pump mounting surfaces at pump and mounting flange for nicks, cuts or damage. Inspect o-ring surfaces for nicks, cuts or damage.

(2) Clean injection pump mounting flange at gear housing. Also clean front of injection pump.

(3) Install new rubber o-ring into machined groove (Fig. 12) at pump mounting area.

(4) Apply clean engine oil **to injection pump o-ring only.**

The machined tapers on both injection pump shaft and injection pump gear must be absolutely dry, clean and free of any dirt or oil film.

FUEL INJECTION PUMP (Continued)

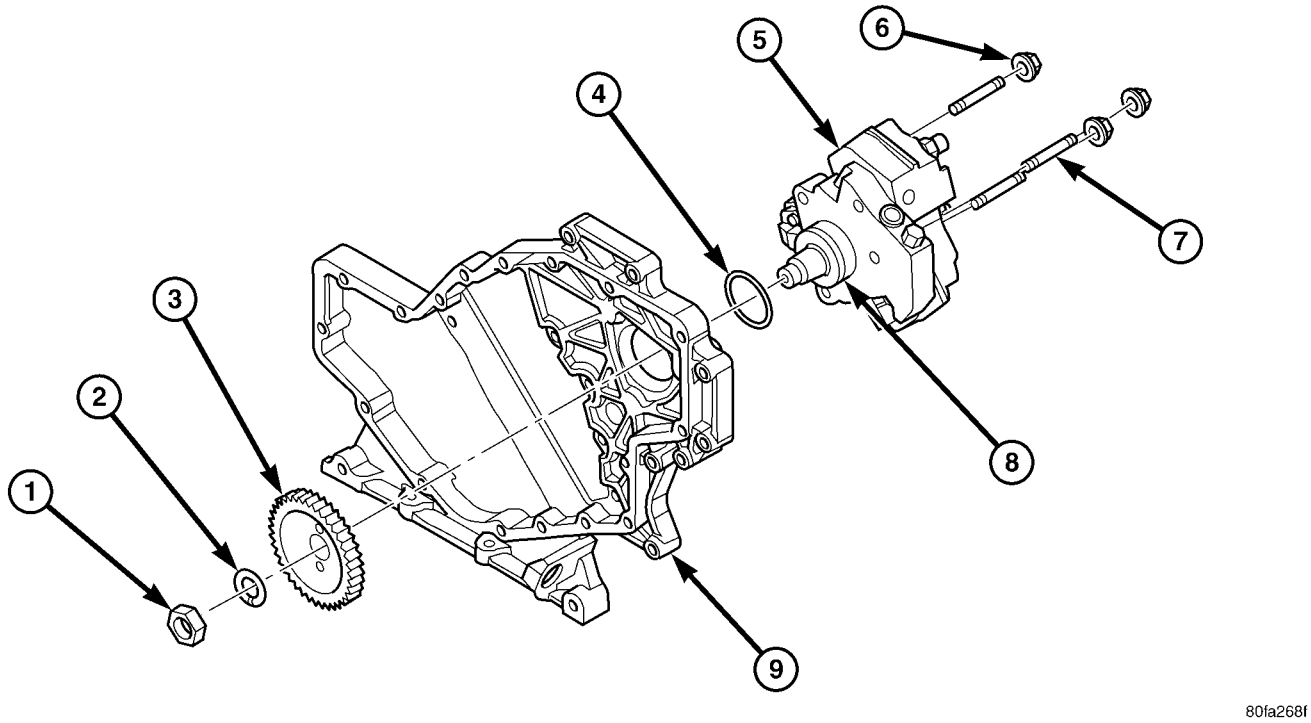

Fig. 12 FUEL INJECTION PUMP REMOVAL/INSTALLATION

1 - PUMP DRIVE GEAR NUT
2 - WASHER
3 - PUMP DRIVE GEAR
4 - RUBBER O-RING
5 - FUEL INJECTION PUMP
6 - PUMP MOUNTING NUTS (3)
7 - PUMP MOUNTING STUDS (3)
8 - O-RING MACHINED GROOVE
9 - FRONT TIMING GEAR HOUSING

This will ensure proper gear-to-shaft tightening.

(5) Clean pump gear and pump shaft at machined tapers with an evaporative type cleaner such as brake cleaner.

(6) Position injection pump to mounting flange on gear housing while aligning injection pump shaft through back of injection pump gear.

(7) After pump is positioned flat to mounting flange, install 3 pump mounting nuts and tighten **finger tight only.** Do not attempt a final tightening at this time. **Do not attempt to tighten (pull) pump to gear housing using mounting nuts. Damage to pump or gear cover may occur. The pump must be positioned flat to its mounting flange before attempting to tighten 3 mounting nuts.**

(8) To prevent damage or cracking of components, install and tighten nuts in the following sequence:

(a) Install injection pump shaft washer and nut to pump shaft. Tighten nut **finger tight only.**

(b) Do preliminary (light) tightening of injection pump shaft nut.

(c) Tighten 3 injection pump mounting nuts to 24 N·m (18 ft. lbs.).

(d) Do a final tightening of pump shaft nut to 105 N·m (77 ft. lbs.).

(9) Install drive gear access cover (plate) using a 3/8” drive ratchet. Plate is threaded to timing gear cover. Tighten to 8 N·m (71 in. lbs.) torque.

(10) Install fuel line (injection pump-to-pressure limiting valve). Tighten bolts to 24 N·m (18 ft. lbs.) torque.

(11) Install fuel line (injection pump-to-fuel rail).

(a) Tighten fitting at fuel pump to 37 N·m (27 ft. lbs.) torque. Use a back-up wrench.

(b) Tighten fitting at fuel rail to 37 N·m (27 ft. lbs.) torque.

(12) Install fuel line (injection pump-to-fuel filter housing). Tighten to 24 N·m (18 ft. lbs.) torque.

(13) Connect Fuel Control Actuator (FCA) electrical connector to rear of injection pump.

(14) Install intake manifold air intake tube (above injection pump). Tighten clamps.

(15) Install accessory drive belt.

(16) Install cooling fan shroud.

(17) Install cooling fan assembly.

(18) Connect both negative battery cables to both batteries.

(19) Check system for fuel or engine oil leaks.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel tank module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel tank module on diesel powered models has 2 different circuits (wires). Two of these circuits are used at the fuel gauge sending unit for fuel gauge operation. The diesel engine does not have a fuel tank module mounted electric fuel pump. The electric fuel pump (fuel transfer pump) is mounted to the engine.

For Fuel Gauge Operation: A constant input voltage source of about 12 volts (battery voltage) is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Engine Control Module (ECM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel tank module electrical connector unplugged). With the connectors plugged, output voltages will vary from about .6 volts at FULL, to about 7.0 volts at EMPTY.** The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the ECM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the ECM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the ECM, the ECM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

REMOVAL

REMOVAL/INSTALLATION

For diesel removal and installation procedures, refer to the gas section of Fuel System/Fuel Delivery. See Fuel Level Sending Unit/Sensor Removal/Installation.

FUEL LINES

DESCRIPTION

Low-Pressure Lines Are:

- the fuel supply line from fuel tank to fuel transfer (lift) pump.
- the fuel return line back to fuel tank.
- the fuel drain (manifold) line at rear of cylinder head.
- the fuel supply line from fuel filter to fuel injection pump.
- the fuel injection pump return line.

High-Pressure Lines Are:

- the fuel line from fuel injection pump to fuel rail.
- the 6 fuel lines from fuel rail up to injector connector tubes

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 160,000 KPA (23,206 PSI). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

OPERATION

High-Pressure Lines

CAUTION: The high-pressure fuel lines must be held securely in place in their holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel (under pressure) of up to approximately 160,000 kPa (23,206 PSI) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

FUEL LINES (Continued)

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING - HIGH-PRESSURE FUEL LINE LEAKS

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES OF UP TO 160,000 kPa (23,206 PSI), USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND OR A FINGER NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Start the engine. Move the cardboard (Fig. 13) over the suspected high-pressure fuel line leak, and check for fuel spray onto the cardboard. If line is leaking, retorque line. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

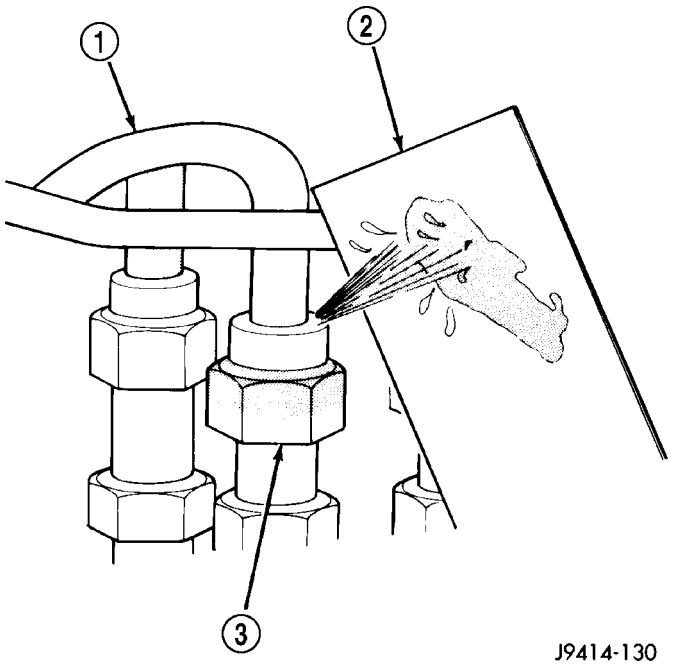

Fig. 13 TYPICAL TEST FOR LEAKS USING CARDBOARD

1 - HIGH-PRESSURE LINE
2 - CARDBOARD
3 - TYPICAL HIGH-PRESSURE FITTING

(2) Thoroughly clean fuel lines at both ends.

(3) If removing fuel line at either #1 or #2 cylinder, the intake manifold air heater elements must first be removed from top of intake manifold. Refer to Intake Air Heater Removal / Installation for procedures.

(4) If removing fuel line at #6 cylinder, a bracket (Fig. 14) is located above fuel line connection at cylinder head. Two bolts secure this bracket to rear of cylinder head. The upper bolt hole is slotted. Loosen (but do not remove) these 2 bracket bolts. Tilt bracket down to gain access to #6 fuel line connection.

(5) Remove engine lift bracket (if necessary).

(6) Remove necessary insulated fuel line support clamps (Fig. 15) and bracket bolts at intake manifold. DO NOT remove insulators from fuel lines.

(7) Place shop towels around fuel lines at fuel rail and injectors. If possible, do not allow fuel to drip down side of engine.

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINES ATTACHED TO A SEPARATE FITTING (Fig. 16) , USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

(8) Carefully remove each fuel line from engine. Note position of each while removing. **Do not bend lines while removing.**

FUEL LINES (Continued)

INSTALLATION

All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: Anytime a high-pressure line is removed from the engine, its fuel connector nut at the cylinder head must first be retorqued. Refer to Torque Specifications.

(1) Tighten fuel lines at high pressure injector connector. Refer to Torque Specifications.
(2) Position fuel line support clamp(s) to fuel line(s). Install clamp nuts/bolts and tighten finger tight.
(3) Position proper fuel line to proper injector on engine. Tighten fittings hand tight at both ends of line.
(4) Tighten fuel lines at fuel rail. Refer to Torque Specifications.
(5) Tighten clamp/support nuts and bolts. Refer to Torque Specifications.
(6) Install engine lifting bracket and bolt. Refer to Torque Specifications.
(7) If fuel line at either #1 or #2 cylinder has been replaced, install intake manifold air heater elements to top of intake manifold. Refer to Intake Air Heater Removal / Installation for procedures.
(8) If fuel line at #6 cylinder has been replaced, tilt metal bracket upward and tighten 2 bolts at rear of cylinder head. Refer to Torque Specifications.
(9) Install remaining fuel line support clamps and bracket bolts at intake manifold. Refer to Torque Specifications.
(10) Connect both negative battery cables to both batteries.
(11) Prime fuel system. Refer to Fuel System Priming.
(12) Check lines/fittings for leaks.

FUEL PRESSURE SENSOR

DESCRIPTION

The fuel pressure sensor is mounted vertically near the top/center of the fuel rail.

OPERATION

The fuel pressure sensor monitors actual high-pressure within the fuel rail. An output signal from this sensor (relating to fuel pressure) is sent to the Engine Control Module (ECM).

REMOVAL

The fuel pressure sensor is mounted vertically near the top/center of the fuel rail (Fig. 17).
(1) Disconnect electrical connector at sensor.
(2) Remove sensor from fuel rail.
(3) Inspect sensor sealing ring and its sealing surface.

4 - FUEL PRESSURE SENSOR
5 - TOP OF INTAKE HEATER MANIFOLD

FUEL PRESSURE SENSOR (Continued)

INSTALLATION

(1) Inspect fuel pressure sensor sealing surface.
(2) Lubricate sensor threads with clean diesel fuel.
(3) Install sensor into fuel rail.
(4) To prevent leaks, sensor **must** be tightened to prescribed torque. Refer to Torque Specifications.
(5) Connect electrical connector to sensor.
(6) Start engine and check for fuel leaks.

FUEL PRESSURE LIMITING VALVE

DESCRIPTION

The fuel pressure limiting valve is located on the top of the fuel rail.

OPERATION

Fuel pressure at the fuel rail is monitored by the fuel rail pressure sensor. If fuel pressure becomes excessive, the pressure limiting valve opens and vents excess pressure into the fuel drain circuit.

REMOVAL

The fuel pressure limiting valve is located on the top of the fuel rail (Fig. 18).

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

(1) Thoroughly clean area at pressure limiting valve.
(2) Remove banjo bolt (Fig. 18) at banjo fitting.
(3) Remove pressure limiting valve from fuel rail.

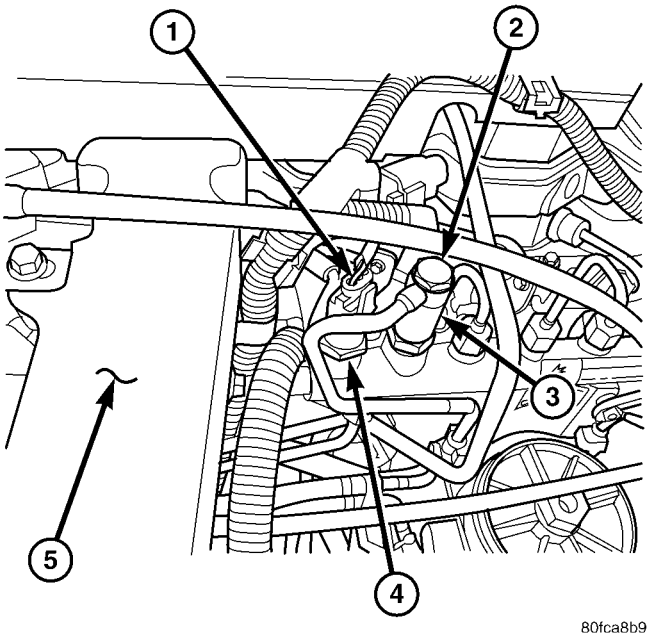

Fig. 18 FUEL PRESSURE SENSOR/FUEL PRESSURE LIMITING VALVE

1 - ELEC. CONNECTOR
2 - BANJO BOLT
3 - FUEL PRESSURE LIMITING VALVE
4 - FUEL PRESSURE SENSOR
5 - TOP OF INTAKE HEATER MANIFOLD

INSTALLATION

(1) Be sure both top of manifold and limiting valve are clean.
(2) Install valve. Refer to Torque Specifications.
(3) Assemble banjo bolt and new sealing washers to limiting valve.
(4) Tighten banjo bolt. Refer to Torque Specifications.

FUEL TANK

DESCRIPTION - DIESEL

The fuel tank is similar to the tank used with gasoline powered models. The tank is equipped with a separate fuel return line and a different fuel tank module for diesel powered models. A fuel tank mounted, electric fuel pump is not used with diesel powered models. Refer to Fuel Tank Module for additional information.

REMOVAL - DIESEL

Fuel Tank Draining

Due to a one-way check valve installed into the fuel fill opening fitting at the tank, the tank cannot be drained conventionally at the fill cap.

(1) Raise vehicle.

(2) If vehicle is equipped with 4 doors and a 6 foot (short) box, remove left-rear tire/wheel.

(3) Thoroughly clean area at top of fuel tank around fuel tank module.

(4) Remove rubber cap from auxiliary fitting on top of tank module (Fig. 19).

(5) Drain fuel tank by attaching drain hose from an approved draining station to auxiliary fitting on top of tank module (Fig. 19).

Tank Removal

(1) Loosen clamp and disconnect rubber fuel fill hose at tank.

(2) Support tank with a hydraulic jack.

(3) Remove 2 fuel tank strap nuts (Fig. 20) and remove both tank support straps.

(4) Carefully lower tank a few inches and disconnect fuel pump module electrical connector (Fig. 19) at top of tank. To disconnect electrical connector: Push upward on red colored tab to unlock. Push on black colored tab while removing connector.

(5) Disconnect fuel supply and return lines at fuel tank module (Fig. 19). Refer to Quick-Connect Fittings for procedures.

(6) Continue to lower tank for removal.

(7) If fuel tank is to be replaced, remove fuel tank module from tank. Refer to Fuel Tank Module Removal/Installation procedures.

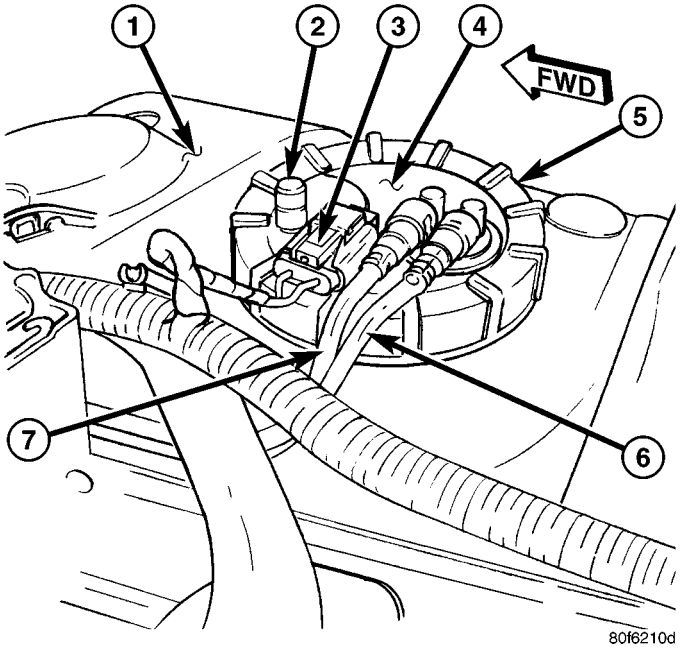

Fig. 19 FUEL TANK MODULE - DIESEL

1 - TOP OF FUEL TANK
2 - AUX. FITTING
3 - ELEC. CONNECTOR
4 - FUEL TANK MODULE (TOP)
5 - LOCKNUT
6 - FUEL SUPPLY LINE
7 - FUEL RETURN LINE

INSTALLATION - DIESEL

(1) If fuel tank is to be replaced, install fuel tank module into tank. Refer to Fuel Tank Module Removal/Installation procedures.

(2) Position fuel tank to hydraulic jack.

(3) Raise tank until positioned near body.

(4) Connect fuel tank module electrical connector at top of tank.

(5) Connect fuel supply and return lines to tank module.

(6) Continue raising tank until positioned snug to body.

(7) Install and position both tank support straps. Install 2 fuel tank strap nuts and tighten. **Tighten rear strap nut first.** Refer to Torque Specifications.

(8) Remove hydraulic jack.

(9) Connect rubber fill hose to fuel fill tube and tighten clamp.

(10) Install tire / wheel (if necessary).

(11) Lower vehicle.

(12) Fill fuel tank with fuel.

(13) Start engine and check for fuel leaks near top of module.

FUEL TANK (Continued)

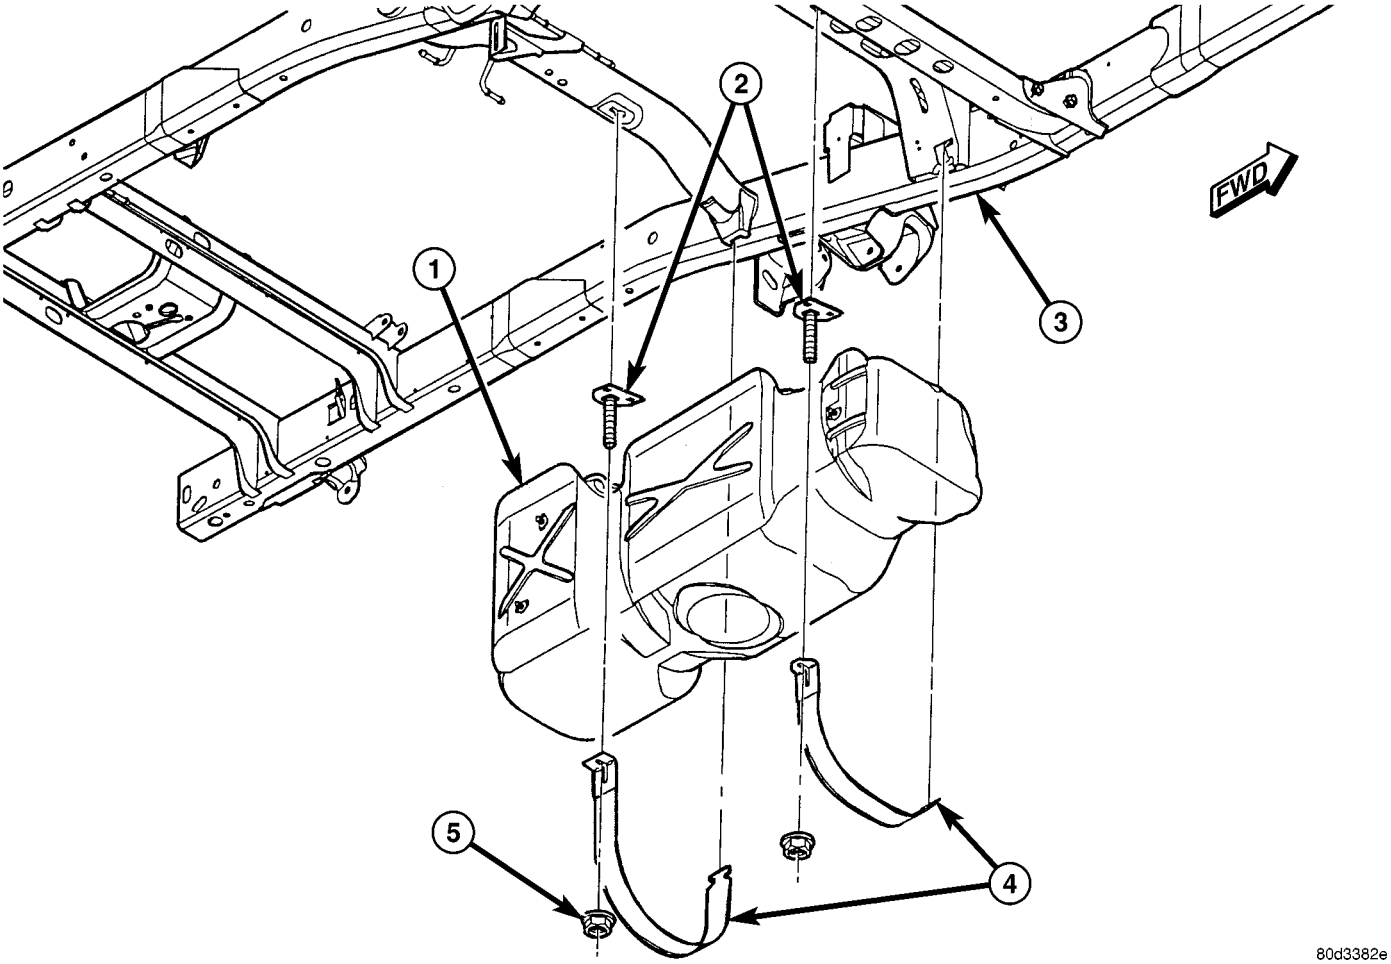

Fig. 20 FUEL TANK MOUNTING

1 - FUEL TANK
2 - STRAP MOUNTING STUDS
3 - VEHICLE FRAME
4 - MOUNTING STRAPS
5 - STRAP NUTS

FUEL TANK MODULE

DESCRIPTION

An electric fuel pump is **not used** in the fuel tank module for diesel powered engines. Fuel is supplied by the engine mounted fuel transfer (lift) pump.

The fuel tank module is installed in the top of the fuel tank (Fig. 21). The fuel tank module contains the following components:

- Fuel reservoir
- A separate in-tank fuel filter
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection
- Fuel return line connection
- Auxiliary non-pressurized fitting

OPERATION

Refer to Fuel Gauge Sending Unit.

REMOVAL

(1) Drain and remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Thoroughly clean area around tank module at top of tank.

(3) The plastic fuel tank module locknut is threaded onto fuel tank. Install Special Tool 6856 to locknut and remove locknut (Fig. 22). The fuel tank module will spring up when locknut is removed.

(4) Remove module from fuel tank.

FUEL TANK MODULE (Continued)

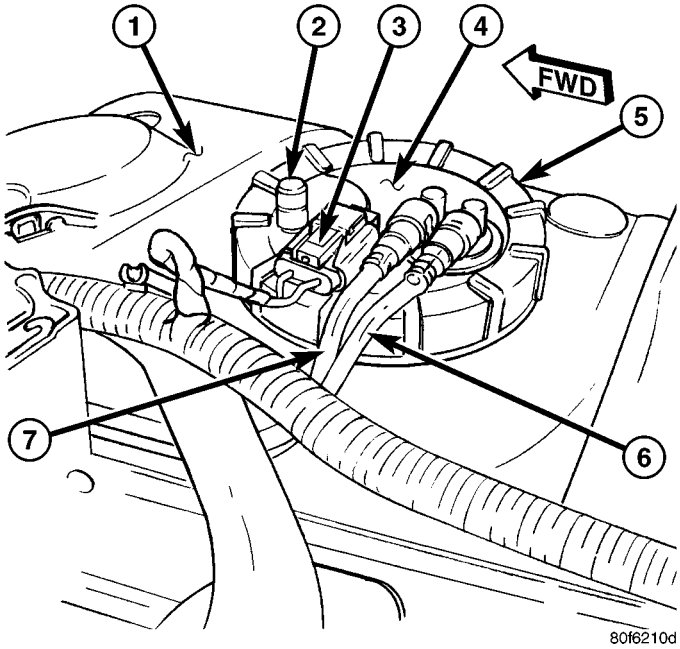

Fig. 21 FUEL TANK MODULE - DIESEL

2 - AUX. FITTING
3 - ELEC. CONNECTOR
4 - FUEL TANK MODULE (TOP)
5 - LOCKNUT
6 - FUEL SUPPLY LINE
7 - FUEL RETURN LINE

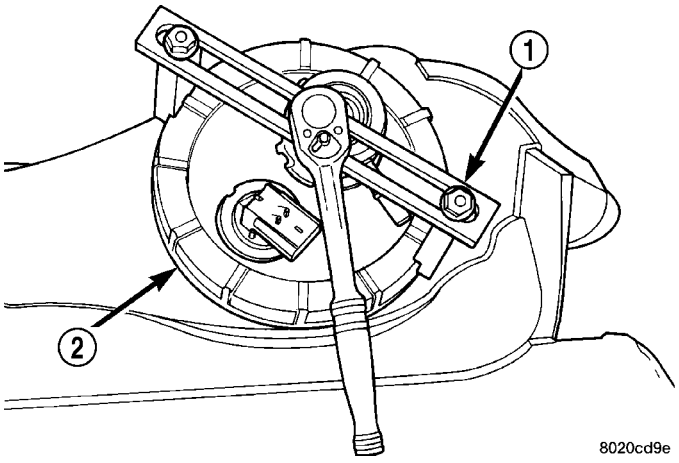

Fig. 22 LOCKNUT REMOVAL/INSTALLATION - TYPICAL MODULE

1 - SPECIAL TOOL 6856
2 - LOCKNUT

INSTALLATION

CAUTION: Whenever the fuel tank module is serviced, the rubber gasket must be replaced.

(1) Thoroughly clean locknut and locknut threads at top of tank.

(2) Using new gasket, carefully position fuel tank module into opening in fuel tank.

(3) Position locknut over top of fuel tank module. Install locknut finger tight.

(4) When looking down at tank from drivers side of tank, the fuel line connectors and fuel gauge electrical connector should all be pointed to drivers side of vehicle. Rotate and align if necessary before tightening locknut. **This step must be performed to prevent the module's float from contacting side of fuel tank.**

(5) Tighten locknut to 24 - 44 N·m (18 - 32 ft. lbs.) torque.

(6) Install fuel tank. Refer to Fuel Tank Removal/ Installation.

FUEL TRANSFER PUMP

DESCRIPTION

The fuel transfer pump (fuel lift pump) is attached to the rear of the fuel filter/water separator housing. The 12–volt electric pump is operated and controlled by the Engine Control Module (ECM).

OPERATION

The purpose of the fuel transfer pump is to supply (transfer) a low-pressure fuel source: **from** the fuel tank, **through** the fuel filter/water separator and **to** the fuel injection pump. Here, the low-pressure is raised to a high-pressure by the fuel injection pump for operation of the high-pressure fuel injectors. Check valves within the pump, control direction of fuel flow and prevent fuel bleed-back during engine shut down.

Maximum current flow to the pump is 5 amperes.

With the engine running, the pump has a 100 percent duty-cycle.

The transfer pump is self-priming: When the key is first turned on (without cranking engine), the pump will operate for approximately 2 seconds and then shut off. The pump will also operate for up to 25 seconds after the starter is engaged, and then disengaged and the engine is not running. The pump shuts off immediately if the key is on and the engine stops running.

The fuel volume of the transfer pump will always provide more fuel than the fuel injection pump requires. Excess fuel is returned from the injection pump through an overflow valve, and then back to the fuel tank.

REMOVAL

The fuel transfer pump (fuel lift pump) is attached to the rear of the fuel filter/water separator housing (Fig. 23).

FUEL TRANSFER PUMP (Continued)

(1) Drain fuel from fuel filter housing. Refer to Fuel Filter/Water Separator - Removal. See Draining.

(2) Disconnect electrical connector (Fig. 23) from fuel transfer pump.

(3) Disconnect fuel tank supply line from fuel transfer pump extension line. This is done at disconnection point at inside of left inner frame rail (Fig. 24). Refer to quick-connect fittings for procedures.

(4) Remove 4 pump mounting bolts (hex-allen), and remove pump from fuel filter housing.

(5) Confirm that transfer pump o-ring is also removed from fuel filter housing.

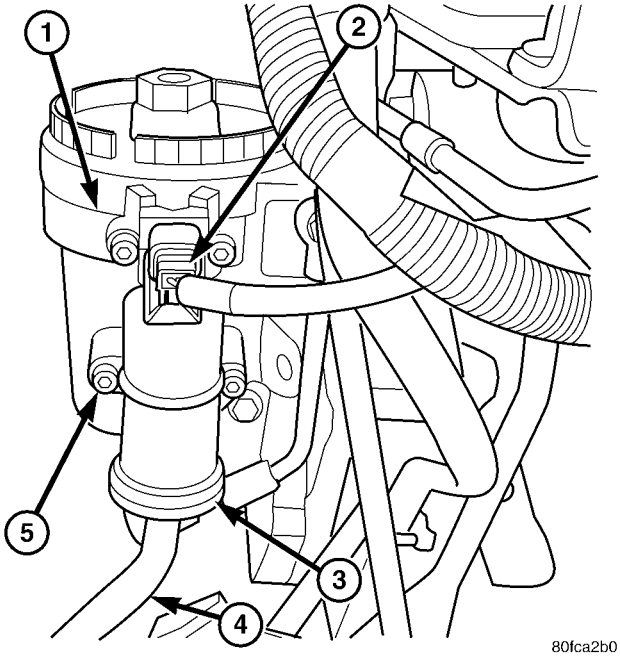

Fig. 23 FUEL TRANSFER (LIFT) PUMP

1 - FILTER HOUSING
2 - ELEC. CONNECTOR
3 - FUEL TRANSFER (LIFT) PUMP
4 - FUEL LINE EXTENTION
5 - MOUNTING BOLTS (4)

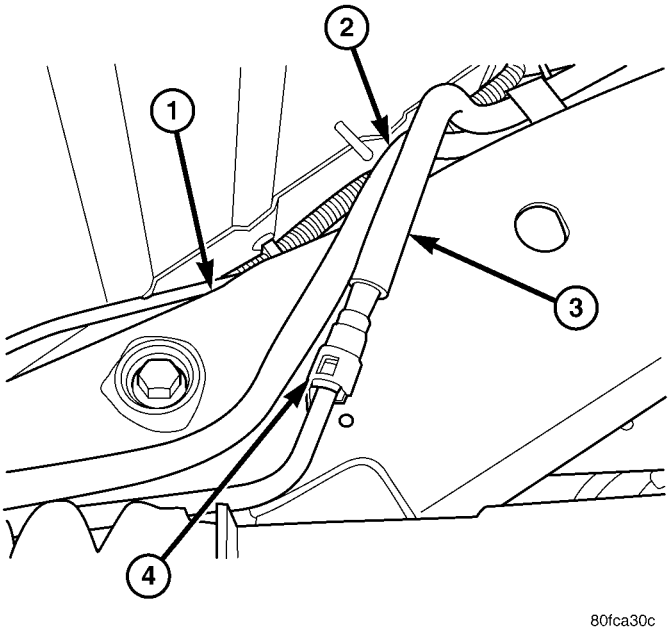

Fig. 24 TRANSFER PUMP FUEL LINE CONNECT

1 - LEFT INNER FRAME RAIL
2 - FUEL RETURN LINE
3 - FUEL SUPPLY LINE
4 - QUICK-CONNECT FITTING

INSTALLATION

(1) Install a new o-ring to fuel transfer pump.

(2) Lubricate o-ring and OD of transfer pump inlet connector.

(3) Position fuel transfer pump onto fuel filter housing. **Do not use mounting bolts to draw transfer pump to filter housing.**

(4) Be sure pump is positioned flat to fuel filter housing. Install mounting bolts and evenly tighten to 7 N·m (61 in. lbs.).

(5) Connect fuel line extension at fuel supply line.

(6) Connect electrical connector to pump.

(7) **Prime System:** Cycle key to actuate transfer pump, or use DRB Scan Tool to actuate transfer pump. Check for leaks.

(8) Operate engine and check for fuel leaks.

CASCADE OVERFLOW VALVE

DESCRIPTION

The cascade overflow valve is located on the top/rear side of the fuel injection pump (Fig. 25).

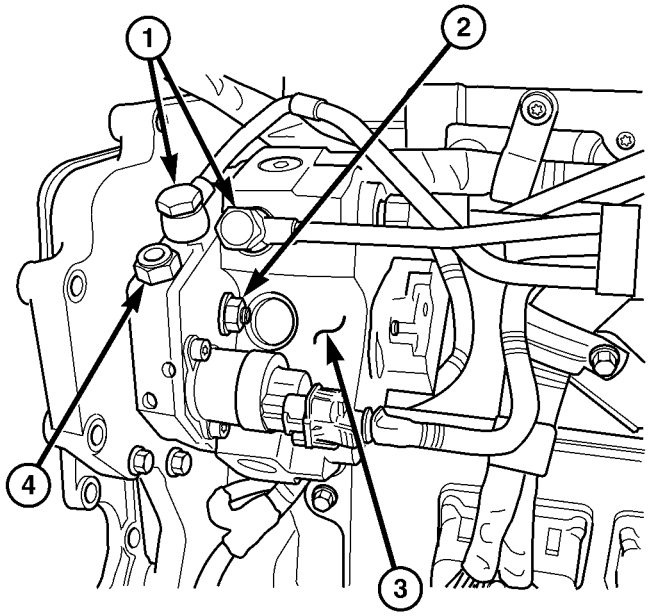

Fig. 25 OVERFLOW VALVE

1 - BANJO BOLTS
2 - PUMP MOUNTING NUTS (3)
3 - FUEL INJECTION PUMP
4 - CASCADE OVERFLOW VALVE

OPERATION

When the fuel control actuator (FCA) is opened, the maximum amount of fuel is being delivered to the fuel injection pump. The cascade valve regulates how much excess fuel is used for lubrication of the injection pump, and is also used to route excess fuel through the drain circuit and back into the fuel tank.

REMOVAL

REMOVAL/INSTALLATION

The cascade overflow valve is not serviced separately.

WATER IN FUEL SENSOR

DESCRIPTION

The Water-In-Fuel (WIF) sensor is located on the side of the fuel filter/water separator canister (Fig. 26).

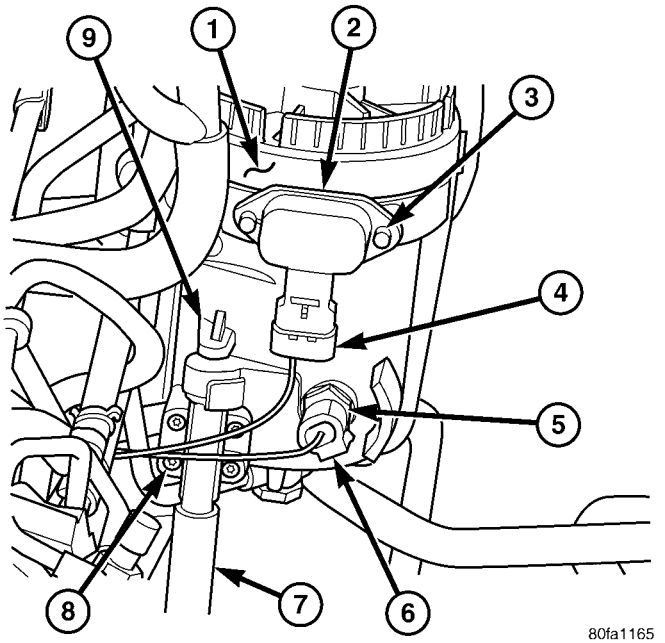

Fig. 26 FILTER HOUSING

1 - FILTER HOUSING
2 - FUEL HEATER AND THERMOSTAT
3 - FUEL HEATER MOUNTING SCREWS
4 - FUEL HEATER ELEC. CONNECTOR
5 - WIF SENSOR
6 - WIF SENSOR ELEC. CONNECTOR
7 - DRAIN HOSE
8 - DRAIN VALVE MOUNTING SCREWS
9 - DRAIN VALVE

OPERATION

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CCD bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input while the engine is running.

REMOVAL

The Water-In-Fuel (WIF) sensor is located at the side of fuel filter/water separator canister. Refer to Fuel Filter/Water Separator Removal/Installation for WIF sensor removal/installation procedures.

FUEL DRAIN CIRCUIT

OPERATION

The Fuel Drain Circuit incorporates several sources of fuel return. Fuel travels from the fuel tank to the fuel transfer pump and is forced through the fuel filter. This fuel then travels into the fuel injection pump. It then goes to a fuel drain line and returns back to the fuel tank.

The fuel that flows to the fuel pump is pressurized by a gear pump and internally transferred to the fuel injection pump. At this point the fuel is channeled into two passages. One passage sends fuel to the FCA (Fuel Control Actuator). The other passage sends fuel to the cascade overflow valve. The overflow valve sends some fuel to a lubrication passage. The rest of the fuel is sent to a drain passage which connects to an external fuel line.

Fuel that travels through the FCA is pressurized by the fuel injection pump and sent through an external high pressure fuel line to the fuel rail. At the fuel rail, fuel is sent to the fuel injectors. If fuel pressure in the fuel rail becomes excessive, the pressure limiting valve opens and sends fuel through an external fuel line.

At the fuel injector, fuel that is not injected is used for lubrication of the fuel injectors. This fuel then travels through an internal passage that is connected to the rear of the cylinder head, an then into an external fuel line. This line is connected to the vehicles fuel return line, and returns excess fuel to the fuel tank.

ACCELERATOR PEDAL POSITION SENSOR

DESCRIPTION

Engine Mounted Sensor: The APPS assembly is located at the top-left-front of the engine. A plastic cover is used to cover the assembly. The actual sensor is located behind its mounting bracket.

Battery Tray Mounted Sensor: The Accelerator Pedal Position Sensor (APPS) assembly is located under the vehicle battery tray. A cable connects the assembly to the accelerator pedal. A plastic cover with a movable door is used to cover the assembly.

OPERATION

Engine Mounted Sensor: The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the Engine Control Module (ECM) with a DC voltage signal proportional to the angle, or position of the accelerator pedal.

Battery Tray Mounted Sensor: The APPS provides the ECM with two DC voltage signals which change as the position of the accelerator changes. One of the DC voltage signals will be half the voltage of the other signal.

REMOVAL

Engine Mounted Sensor :

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket. The APPS assembly is located at left-front of engine below plastic cable/lever/linkage cover (Fig. 1).

ACCELERATOR PEDAL POSITION SENSOR (Continued)

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 3) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

(1) Disconnect both negative battery cables at both batteries.

(2) Remove cable cover (Fig. 1). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 1). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(3) Using finger pressure only, disconnect end of speed control servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 2). **DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(4) Using two small screwdrivers, pry throttle cable connector socket from throttle lever ball (Fig. 2). **Be very careful not to bend throttle lever arm.**

(5) Disconnect transmission control cable at lever arm (if equipped). Refer to 21, Transmission.

(6) Squeeze pinch tabs on speed control cable (Fig. 2) and pull cable rearward to remove from cable mounting bracket.

(7) Squeeze pinch tabs on throttle cable (Fig. 2) and pull cable rearward to remove from cable mounting bracket.

(8) Refer to 21, Transmission for transmission control cable removal procedures.

(9) Disconnect wiring harness clip (Fig. 3) at bottom of bracket.

(10) Remove 6 mounting bolts (Fig. 3) and partially remove APPS assembly from engine. After assembly is partially removed, disconnect electrical connector from bottom of sensor by pushing on connector tab (Fig. 4).

(11) Remove APPS assembly from engine.

Battery Tray Mounted Sensor :

The APPS is serviced (replaced) as one assembly including the sensor, plastic housing and cable. The APPS assembly is located under the left (drivers side) vehicle battery tray (Fig. 5). Access to APPS is gained from over top of left / front tire.

(1) Disconnect negative battery cable at battery.

(2) Disconnect APPS cable at accelerator pedal. Refer to Accelerator Pedal Removal / Installation.

(3) Remove wheel house liner at left / front wheel. Refer to Body.

INSTALLATION

Engine Mounted Sensor :

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket.

(1) Snap electrical connector into bottom of sensor.

(2) Position APPS assembly to engine and install 6 bolts. Tighten bolts to 24 N·m (18 ft. lbs.) torque.

(3) Connect wiring harness clip at bottom of bracket.

(4) Refer to Group 21, Transmission for transmission control cable installation procedures.

(5) Install speed control cable into mounting bracket. Be sure pinch tabs have secured cable.

(6) Install throttle cable into mounting bracket. Be sure pinch tabs have secured cable.

(7) Connect throttle cable at lever (snaps on).

(8) Connect speed control cable to lever by pushing cable connector rearward onto lever pin while holding lever forward.

(9) Install cable cover.

(10) Connect both negative battery cables to both batteries.

(11) If necessary, use DRB III® Scan Tool to erase any Diagnostic Trouble Codes (DTC's) from ECM.

Battery Tray Mounted Sensor :

(1) Install Accelerator Pedal Position Sensor (APPS) cable to accelerator pedal. Refer to Accelerator Pedal Removal / Installation.

(2) Connect electrical connector to APPS.

(3) If necessary, connect cable to APPS lever ball socket (snaps on).

(4) Snap APPS cable cover closed.

(5) Position APPS assembly to bottom of battery tray and install 3 bolts. Refer to Torque Specifications.

(6) Install wheelhouse liner. Refer to Body.

(7) Perform the following procedure:

(a) Connect negative battery cables to both batteries.

(b) Turn key switch ON, but do not crank engine.

(c) Leave key switch ON for a minimum of 10 seconds. This will allow ECM to learn electrical parameters.

(8) If necessary, use DRB III® Scan Tool to erase any Diagnostic Trouble Codes (DTC's) from ECM.

CAMSHAFT POSITION SENSOR

DESCRIPTION

The Camshaft Position Sensor (CMP) on the 5.9L diesel engine is located below the fuel injection pump. It is bolted to the back of the timing gear housing.

OPERATION

The diesel Camshaft Position Sensor (CMP) contains a hall effect device. A rotating target wheel (tonewheel) for the CMP is located on the camshaft gear. This hall effect device detects notches located on the back side of the camshaft gear. As the camshaft gear rotates, the notches pass the tip of the CMP.

When the leading edge of the notch passes the tip of the CMP, the following occurs: The interruption of magnetic field causes the voltage to switch high resulting in a signal of approximately 5 volts.

When the trailing edge of the notch passes the tip of the CMP, the following occurs: The change of the magnetic field causes the signal voltage to switch low to 0 volts.

The CMP (Fig. 8) provides a signal to the Engine Control Module (ECM) at all times when the engine is running. The ECM uses the CMP information primarily on engine start-up. Once the engine is running, the ECM uses the CMP as a backup sensor for engine speed. The Crankshaft Position Sensor (CKP)

CAMSHAFT POSITION SENSOR (Continued)

is the primary engine speed indicator for the engine after the engine is running.

3 - ELECTRONIC CONTROL MODULE (ECM)
4 - ECM ELEC. CONNECTOR
5 - CMP ELEC. CONNECTOR
6 - CMP MOUNTING BOLT
7 - BACK OF TIMING GEAR HOUSING

REMOVAL

The Camshaft Position Sensor (CMP) on the 5.9L diesel engine is located below the fuel injection pump. It is bolted to the back of the timing gear housing (Fig. 9).

(1) Disconnect electrical connector at CMP sensor (Fig. 9).

(2) Remove sensor mounting bolt.

(3) Carefully twist sensor from timing gear housing.

(4) Check condition of sensor o-ring.

INSTALLATION

(1) Clean out machined hole in back of timing gear housing (cover).

(2) Apply a small amount of engine oil to sensor o-ring.

(3) Install sensor into timing gear housing (cover) with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to back of timing chain housing (cover). If sensor is not flush, damage to sensor mounting tang may result.

(4) Install mounting bolt and tighten. Refer to Torque Specifications.

(5) Connect electrical connector to sensor.

CRANKSHAFT POSITION SENSOR

DESCRIPTION

The Crankshaft Position Sensor (CKP) on the diesel engine is attached at the front / left side of the engine next to the engine harmonic balancer (crankshaft damper).

OPERATION

The Crankshaft Position Sensor (CKP) is the primary engine speed indicator for the engine after the engine is running (Fig. 10). The CKP contains a hall effect device. A rotating, notched target wheel (tonewheel) for the CKP is located on the engine harmonic balancer (Fig. 11). This hall effect device detects notches located on the tonewheel. As the tonewheel rotates, the notches pass the tip of the CKP.

CRANKSHAFT POSITION SENSOR (Continued)

When the leading edge of the tonewheel notch passes the tip of the CKP, the following occurs: The interruption of magnetic field causes the voltage to switch high resulting in a signal of approximately 5 volts.

When the trailing edge of the tonewheel notch passes the tip of the CKP, the following occurs: The change of the magnetic field causes the signal voltage to switch low to 0 volts.

The Camshaft Position Sensor (CMP) also provides a signal to the Engine Control Module (ECM) at all times when the engine is running. The ECM uses this CMP information primarily on engine start-up. Once the engine is running, the ECM uses the CMP as a backup sensor for engine speed.

REMOVAL

(1) Raise and support vehicle

(2) Disconnect electrical connector at CKP sensor (Fig. 12).

(3) Remove 1 sensor mounting bolt.

(4) Remove CKP sensor.

INSTALLATION

(1) Position and install CKP sensor to engine.

(2) Install 1 sensor mounting bolt and tighten to 9 N·m (80 in. lbs.) torque.

(3) Install electrical connector to CKP sensor (Fig. 12).

FUEL CONTROL ACTUATOR

DESCRIPTION

The Fuel Control Actuator (FCA) is located at the rear of the high-pressure, fuel injection pump (Fig. 13).

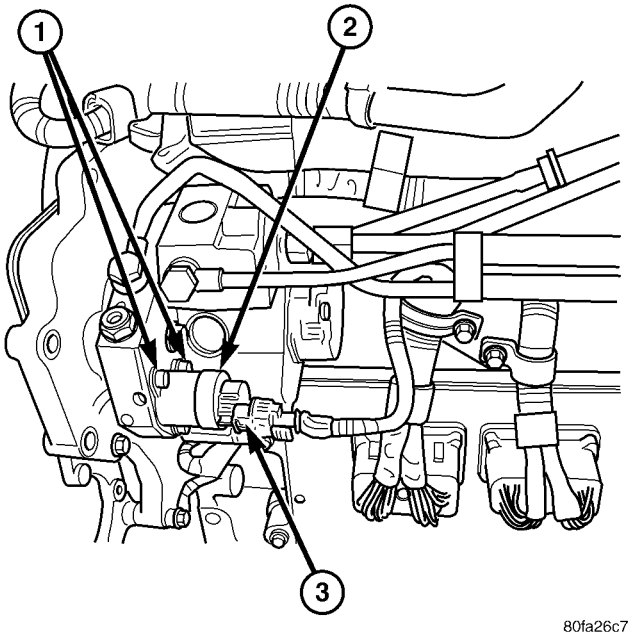

Fig. 13 FUEL CONTROL ACTUATOR

1 - ACTUATOR MOUNTING BOLTS
2 - FCA (FUEL CONTROL ACTUATOR)
3 - ACTUATOR ELECTRICAL CONNECTOR

OPERATION

The Fuel Control Actuator (FCA) is an electronically controlled solenoid valve. The ECM controls the amount of fuel that enters the high-pressure pumping chambers by opening and closing the FCA based on a demanded fuel pressure. When the FCA is opened, the maximum amount of fuel is being supplied to the fuel injection pump. Any fuel that does not enter the injection pump is directed to the cascade overflow valve. The cascade overflow valve regulates how much excess fuel is used for lubrication of the pump and how much is returned to the fuel tank through the drain manifold.

An audible click from the FCA is normal when operating the key from the ON to the OFF position.

REMOVAL

The Fuel Control Actuator (FCA) is a non-servicable part.

FUEL INJECTOR

DESCRIPTION

Six individual, solenoid actuated high-pressure fuel injectors are used (Fig. 14). The injectors are vertically mounted into a bored hole in the top of the cylinder head. This bored hole is located between the intake/exhaust valves. High-pressure connectors (Fig. 15), mounted into the side of the cylinder head, connect each fuel injector to each high-pressure fuel line.

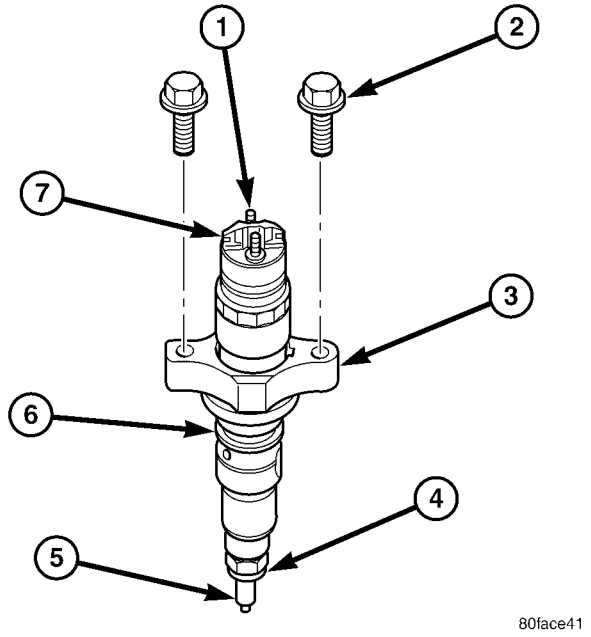

Fig. 14 FUEL INJECTOR - DIESEL

1 - SOLENOID ELECTRICAL CONNECTOR STUDS
2 - MOUNTING BOLTS
3 - MOUNTING PLATES
4- COPPER SEALING WASHER
5 - INJECTOR TIP
6 - INJECTOR O-RING
7 - INJECTOR ELECTRICAL SOLENOID

OPERATION

High-pressure fuel is supplied from the injection pump, through a high-pressure fuel line, into a fuel rail, through high-pressure lines, through steel connectors and into the solenoid actuated fuel injector. The ECM actuates the solenoid causing the needle valve to rise and fuel flows through the spray holes in the nozzle tip into the combustion chamber.

Each fuel injector is connected to the fuel rail by a high-pressure fuel line and a steel connector. This steel connector is positioned into the cylinder head and sealed with an o-ring. The connector is retained in the cylinder head by a nut (fitting) that is threaded into the cylinder head.

FUEL INJECTOR (Continued)

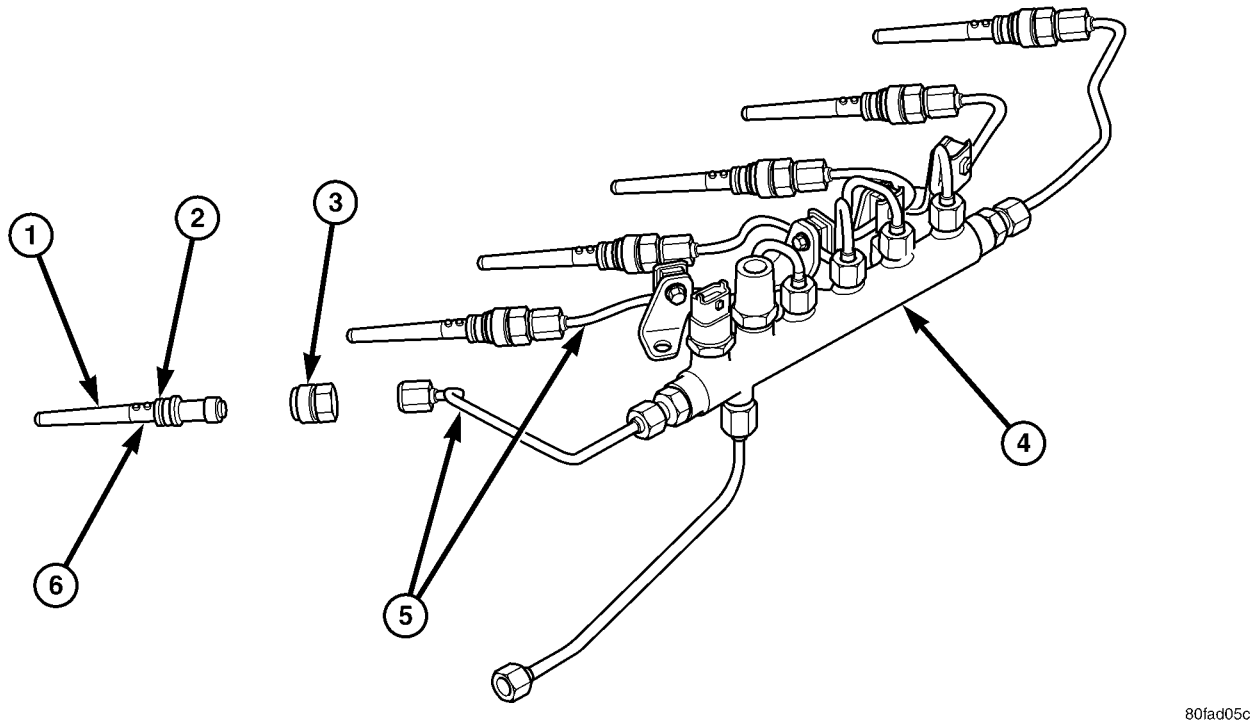

Fig. 15 HIGH-PRESSURE CONNECTOR

1 - HIGH-PRESSURE CONNECTOR (TO FUEL INJECTOR)
2 - O-RING
3 - CONNECTOR RETAINER
4 - FUEL RAIL
5 - HIGH-PRESSURE FUEL LINES
6 - LOCATING PINS

The torquing force of this threaded nut (fitting) provides a sealing pressure between the fuel line connector and the fuel injector. **Retaining nut torque is very critical.** If the nut (fitting) is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If the fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside the cylinder head and will not be visible. The result will be a possible fuel injector miss-fire and low power, or a no-start condition.

The fuel injectors use hole type nozzles. High-pressure flows into the side of the injector, the ECM activates the solenoid causing the injector needle to lift and fuel to be injected. The clearances in the nozzle bore are extremely small and any dirt or contaminants will cause the injector to stick. Because of this, it is very important to do a thorough cleaning of any lines before opening up any fuel system component. Always cover or cap any open fuel connections before a fuel system repair is performed.

Each fuel injector connector tube contains an edge filter that is designed to beak up small contaminants before entering the fuel injector. **The edge filters are not a substitute for proper cleaning and covering of all fuel system components during repair.**

The bottom of each fuel injector is sealed to the cylinder head with a **1.5mm** thick copper shim (gasket). The correct thickness shim must always be reinstalled after removing an injector.

Fuel pressure in the injector circuit decreases after injection. The injector needle valve is immediately closed and fuel flow into the combustion chamber is stopped. Exhaust gases are prevented from entering the injector nozzle by the needle valve.

REMOVAL

CAUTION: Refer to Cleaning Fuel System Parts.

Six individual, solenoid actuated high-pressure fuel injectors are used (Fig. 14). The injectors are vertically mounted into a bored hole in the top of the cylinder head. This bored hole is located between the intake/exhaust valves. High-pressure connectors (Fig. 15), mounted into the side of the cylinder head, connect each fuel injector to each high-pressure fuel line.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

(2) Remove breather assembly.

FUEL INJECTOR (Continued)

(3) Remove valve cover. Refer to Engines for procedures.

(4) Remove necessary high pressure fuel line connecting necessary fuel injector rail to high pressure connector. Refer to Fuel Line Removal for procedures.

(5) A connector retainer (nut) (Fig. 15) is used on each connector tube. Remove this nut(s) by unthreading from cylinder head.

(6) Using special high-pressure connector removal tool #9015 (Fig. 16), or (Fig. 17) remove necessary high-pressure connector(s) from cylinder head. Tool #9015 threads onto connector tube. Use tool to pry connector tube(s) from cylinder head.

(7) Remove necessary exhaust rocker arm assembly(s).

(8) Disconnect injector solenoid wire nuts at top of injectors (Fig. 18).

(9) Remove 2 fuel injector hold-down clamp bolts at each injector being removed.

(10) **USING TOOL #9010:**

(a) Special Tool #9010 (Fig. 19) is equipped with 2 clamshell clamps, a sliding retainer sleeve to retain the clamshell clamps, a 2–piece mounting stud, and a pivoting handle. **Do not attempt to remove the fuel injector with any other device. Damage to injector will occur.**

(b) The rocker housing (Fig. 18) is bolted to the top of cylinder head. The mounting stud from tool #9010 was meant to temporarily replace a rocker housing mounting bolt. Remove the necessary rocker housing mounting bolt. These mounting bolts are located at the center of each of the 3 rocker housing support bridges.

(c) Install and tighten 2–piece mounting stud to rocker housing. If removing the #6 fuel injector, separate the 2–piece mounting stud. Install lower half of mounting stud to center of rocker housing bridge. Install upper half of mounting stud to lower half.

(d) Position tool handle to mounting stud and install handle nut. Leave handle nut loose to allow a pivoting action.

(e) Position lower part of clamshell halves to sides of fuel injector (wider shoulder to bottom). The upper part of clamshell halves should also be positioned into machined shoulder on the handles pivoting head.

(f) Slide the retainer sleeve over pivoting handle head to lock clamshell halves together.

(g) Be sure handle pivot nut is loose.

(h) Depress handle downward to remove fuel injector straight up from cylinder head bore.

(11) Remove and discard injector sealing washer. This should be located on tip of injector (Fig. 20) or (Fig. 21).

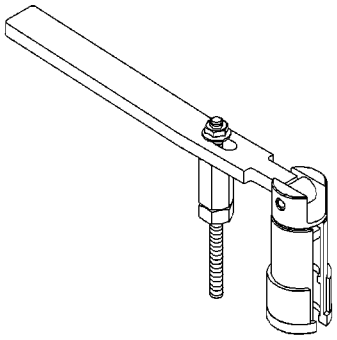

Fig. 19 FUEL INJECTOR REMOVER - #9010

INSTALLATION

(1) **Inspect fuel injector:**

(a) Look for burrs on injector inlet.

(b) Check nozzle holes for hole erosion or plugging.

(c) Inspect end of nozzle for burrs or rough machine marks.

(d) Look for cracks at nozzle end.

(e) If any of these conditions occur, replace injector.

(2) Thoroughly clean fuel injector cylinder head bore. Blow out bore hole with compressed air.

(3) The bottom of fuel injector is sealed to cylinder head bore with a copper sealing washer (shim) of a certain thickness (Fig. 20). A new shim with correct thickness must always be re-installed after removing injector. Measure thickness of injector shim (Fig. 21). **Shim Thickness: 1.5 mm (.060")**

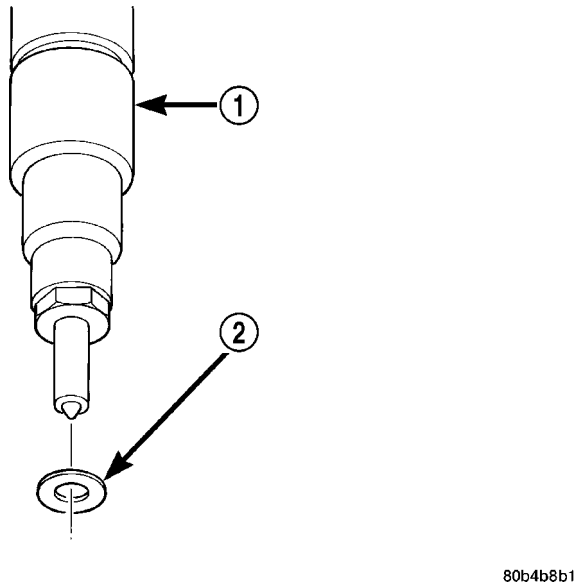

Fig. 20 FUEL INJECTOR SEALING WASHER (SHIM) LOCATION

1 - FUEL INJECTOR
2 - COPPER SEALING WASHER (SHIM)

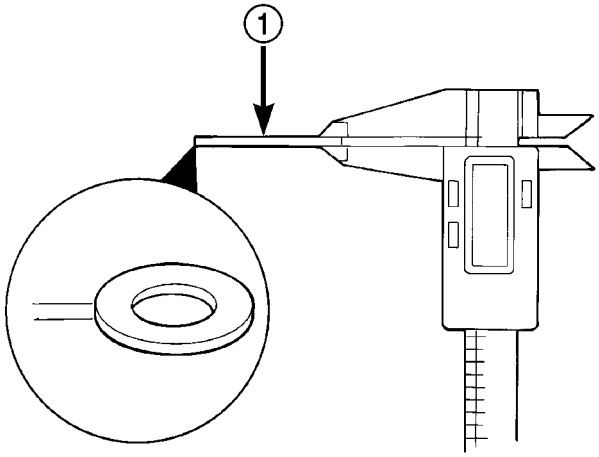

Fig. 21 MEASURING INJECTOR SEALING WASHER (SHIM)

1 - SHIM

(4) Install new shim (washer) to bottom of injector. Apply light coating of clean engine oil to washer. This will keep washer in place during installation.

(5) Install new o-ring to fuel injector. Apply small amount of clean engine oil to o-ring.

FUEL INJECTOR (Continued)

(6) Install injector into cylinder head with male connector port facing the intake manifold. Push down on fuel injector mounting flange to engage o-ring and seat injector.

(7) Tightening Sequence:

(a) Install fuel injector holdown clamp (mounting flange) bolts. **Do a preliminary tightening of these bolts to 5 N·m (44 in. lbs.) torque. This preliminary tightening insures the fuel injector is seated and centered.**

(b) After tightening, relieve bolt torque, but leave both bolts threaded in place.

(c) Install high-pressure connector and retaining nut. Do a preliminary tightening to 15 N·m (11 ft. lbs.) torque.

(d) Alternately tighten injector holdown bolts to 10 N·m (89 in. lbs.) torque.

(e) Do a final tightening of the high-pressure connector and retaining nut. Tighten to 50 N·m (37 ft. lbs.) torque.

(8) Connect injector solenoid wires and nuts to top of injectors (Fig. 18). Tighten connector nuts to 1.25 N·m (11 in. lbs.) torque. **Be very careful not to overtighten these nuts as damage to fuel injector will occur.**

(9) Install exhaust rocker arm assembly. Refer to Engine.

(10) Set exhaust valve lash. Refer to Engine.

(11) Install high pressure fuel line. Refer to Torque Specifications. **Be sure to use a secondary back-up wrench on the connector nut (fitting) while torquing fuel line fitting.** Refer to Fuel Line Installation for additional information.

(12) Install valve cover. Refer to Engine.

(13) Install breather assembly.

(14) Connect negative battery cables to both batteries.

FUEL INJECTOR RAIL

DESCRIPTION

The fuel injector rail is bolted to the top of the intake manifold.

OPERATION

The fuel rail is used as a distribution device to supply high-pressure fuel to the high-pressure fuel lines.

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

(1) Disconnect both negative battery cables at both batteries. Isolate ends of both cables.

(2) Disconnect electrical connector at fuel pressure sensor.

(3) Remove banjo bolt at fuel limiting valve.

(4) Disconnect necessary wiring harness retention clips from intake manifold.

(5) Lift 2 rubber covers to gain access to positive (+), intake heater cable nuts. Remove 2 nuts and remove 2 cables from studs.

(6) Carefully remove 4 high-pressure fuel lines from top of injector rail engine. Note position of each line while removing. **Do not bend lines while removing.**

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINES ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

(7) Carefully remove 2 high-pressure fuel lines at each end of injector rail. Note position of each line while removing. **Do not bend lines while removing.**

(8) Remove fuel line connecting injector pump to fuel rail.

(9) Remove 3 injector rail mounting bolts (Fig. 22).

(10) Remove rail from top of intake manifold.

INSTALLATION

(1) Clean any dirt/debris from top of intake manifold and bottom of fuel rail.

(2) Position fuel rail to top of manifold and install 3 mounting bolts. Refer to Torque Specifications.

(3) Install all high-pressure lines to rail. Refer to Fuel Lines for procedures.

(4) Reposition wiring harness to intake manifold and install new tie wraps.

(5) Install and tighten fuel limiting valve banjo bolt. Refer to Torque Specifications.

(6) Connect electrical connector to fuel pressure sensor.

(7) Position 2 positive (+) cables to intake heater studs. Install 2 nuts.

FUEL INJECTOR RAIL (Continued)

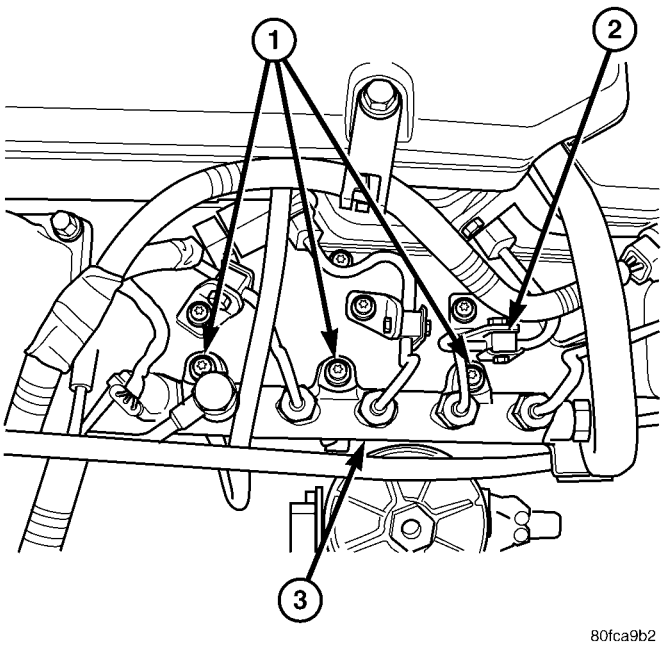

Fig. 22 FUEL INJECTOR RAIL

1 - FUEL RAIL MOUNTING BOLTS (3)
2 - INSULATED CLAMPS

(8) Connect battery cables to both batteries.
(9) Start engine and check for leaks.

INLET AIR TEMPERATURE SENSOR/PRESSURE SENSOR

DESCRIPTION

The combination, dual function Inlet Air Temperature/Pressure Sensor is located on the air cleaner (filter) cover.

OPERATION

The Inlet Air Temperature/Pressure Sensor is a combination dual-function sensor. The sensor element extends into the intake air stream at the top of the air filter housing. Ambient air temperature as well as barometric pressure is monitored by this sensor. The Engine Control Module (ECM) monitors signals from this sensor.

REMOVAL

The Inlet Air Temperature/Pressure Sensor is located on the air cleaner cover (Fig. 23).

(1) Disconnect electrical connector at sensor (Fig. 24).
(2) Remove two Torx-type mounting screws.
(3) Remove sensor from air cleaner cover.
(4) Check condition of sensor o-ring (Fig. 25).

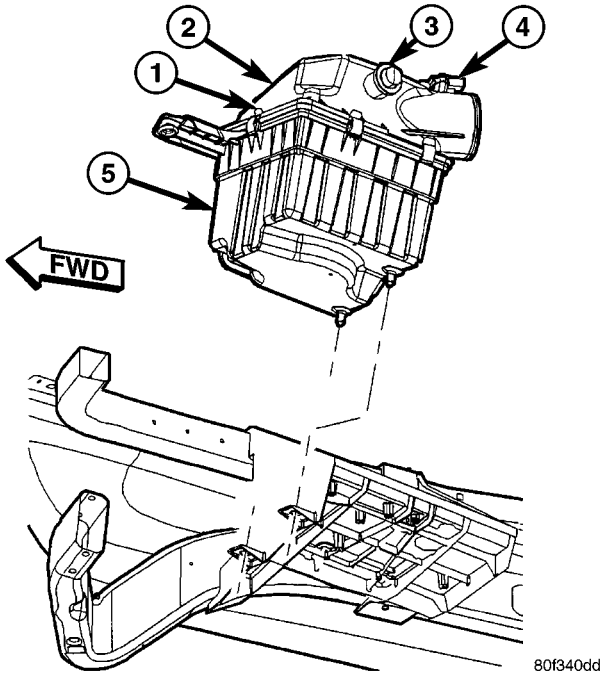

Fig. 23 IAT/PRESSURE SENSOR LOCATION - 5.9L DIESEL

1 - CLIPS
2 - FILTER COVER
3 - FILTER MINDER™
4 - INLET AIR TEMPERATURE/ PRESSURE SENSOR
5 - FILTER HOUSING

INSTALLATION

(1) Check condition of sensor o-ring.
(2) Position sensor into top of air cleaner cover with a slight twisting action.
(3) Install 2 mounting screws.
(4) Install electrical connector.

INTAKE AIR HEATER

DESCRIPTION

The intake manifold air heater element assembly is located in the top of the intake manifold.

OPERATION

The air heater elements are used to heat incoming air to the intake manifold. This is done to help engine starting and improve driveability with cool or cold outside temperatures.

Electrical supply for the 2 air heater elements is controlled by the Engine Control Module (ECM) through the 2 air heater relays. Refer to Intake Manifold Air Heater Relays for more information.

Two heavy-duty cables connect the 2 air heater elements to the 2 air heater relays. Each of these cables will supply approximately 95 amps at 12 volts to an individual heating element within the heater block assembly.

Refer to the Powertrain Diagnostic Procedures manual for electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

REMOVAL

If servicing either of the heater elements, the entire block/element assembly must be replaced.

(1) Disconnect both negative battery cables at both batteries. Cover and isolate ends of both cables.

(2) Remove both the intake manifold air intake tube (above injection pump), and its rubber connector hose (Fig. 26).

(3) Lift 2 rubber covers (Fig. 27) to gain access to 2 positive (+) cable nuts. Remove these 2 nuts (Fig. 28) and remove 2 cables from studs.

(4) Disconnect ground strap (Fig. 27) at heater element stud.

(5) Remove wiring harness clips.

(6) Remove engine oil dipstick tube bracket from air inlet connection and fuel filter housing.

(7) Remove 4 housing mounting bolts (Fig. 27) and remove heater element assembly.

INSTALLATION

If servicing either of the heater elements, the entire block/element assembly must be replaced.

(1) Using 2 new gaskets, position element assembly and air housing to intake manifold.

(2) Install ground cable to air housing.

(3) Install 4 housing bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(4) Connect 2 positive (+) heater cables at cable mounting studs. **Do not allow either of the cable eyelets to contact any other metal source other than the cable nuts/studs.**

(5) Install engine oil dipstick tube and mounting bolt.

(6) Connect rubber connector hose and intake tube to air intake housing. Tighten clamp bolts to 11 N·m (95 in. lbs.) torque.

(7) Connect both negative battery cables at both batteries.

INTAKE AIR HEATER RELAY

DESCRIPTION

The 2 intake manifold air heater relays are located in the engine compartment. They are attached to a common bracket. This bracket is attached to the right battery tray (Fig. 29).

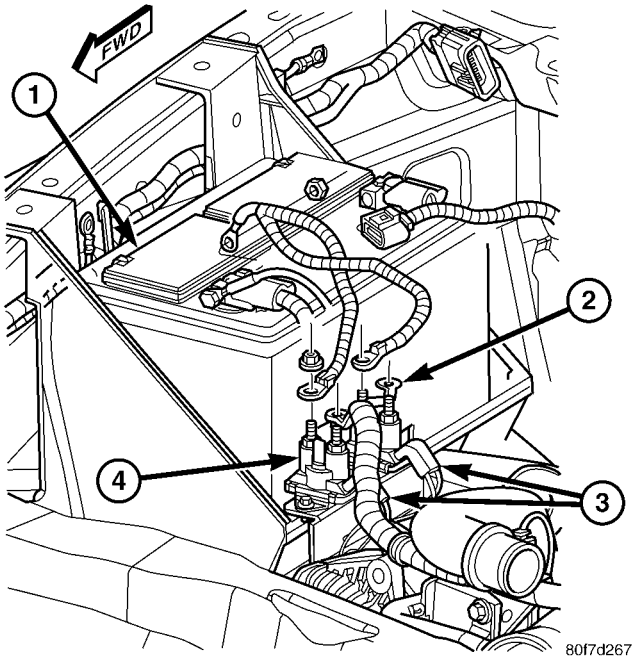

Fig. 29 INTAKE MANIFOLD AIR HEATER RELAYS

1 - BATTERY
2 - CABLES TO INTAKE HEATERS
3 - RELAY TRIGGER WIRES
4 - INTAKE AIR HEATER RELAYS (2)

OPERATION

The Engine Control Module (ECM) operates the 2 heating elements through the 2 intake manifold air heater relays.

Refer to Powertrain Diagnostic Procedures for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

REMOVAL

The 2 intake manifold air heater relays are located in the engine compartment. They are attached to a common bracket. This bracket is attached to the right battery tray (Fig. 29).

The mounting bracket and both relays are replaced as an assembly.

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect four relay trigger wires at both relays. Note position of wiring before removing.

(3) Lift four rubber shields from all 4 cables.

(4) Remove four nuts at cable connectors. Note position of wiring before removing.

(5) Remove relay mounting bracket bolts and remove relay assembly.

INSTALLATION

(1) Install relay assembly to battery tray. Tighten mounting bolts to 4.5 N·m (40 in. lbs.) torque.

(2) Connect eight electrical connectors to relays.

(3) Connect battery cables to both batteries.

INTAKE AIR TEMPERATURE SENSOR/MAP SENSOR

DESCRIPTION

The combination, dual function Intake Manifold Air Temperature Sensor/MAP Sensor is installed into the top of the intake manifold.

OPERATION

The combination, dual function Intake Manifold Air Temperature Sensor/MAP Sensor is installed into the top of the intake manifold with the sensor element extending into the air stream.

The IAT portion of the sensor provides an input voltage to the Engine Control Module (ECM) indicating intake manifold air temperature. The MAP portion of the sensor provides an input voltage to the ECM indicating turbocharger boost pressure.

REMOVAL

The combination, dual function Intake Manifold Air Temperature Sensor/MAP (IAT/MAP) sensor is installed into the top of the intake manifold (Fig. 30).

(1) Clean area around sensor.

(2) Disconnect electrical connector from IAT/MAP sensor.

(3) Remove two T-15 Torx headed screws.

(4) Remove sensor from intake manifold.

(5) Check condition of sensor o-ring (Fig. 31).

INSTALLATION

(1) Check condition of sensor o-ring.

(2) Lubricate sensor o-ring with clean engine oil.

(3) Clean sensor mounting area at intake manifold.

(4) Position sensor into intake manifold.

(5) Install and tighten 2 sensor mounting screws to 1 N·m (9 in. lbs.) torque.

(6) Connect electrical connector to sensor.

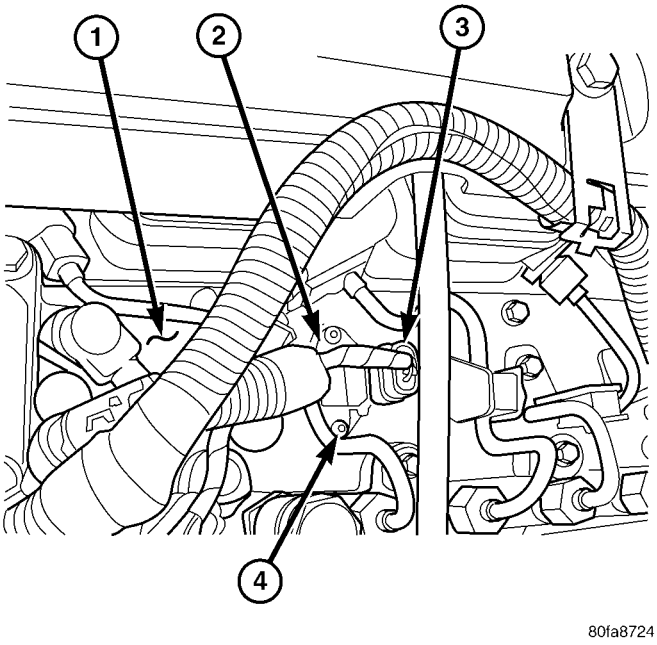

Fig. 30 INTAKE/MAP SENSOR

MAP SENSOR

DESCRIPTION

A combination, dual function Intake Manifold Air Temperature Sensor/MAP Sensor is used. Refer to Intake Air Temperature Sensor/MAP Sensor for information.

THROTTLE CONTROL CABLE

REMOVAL

If Equipped With Engine Mounted Accelerator Pedal Position Sensor

(1) Disconnect both negative battery cables at both batteries.

(2) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 32). The plastic cable retainer snaps into pedal arm.

(3) From inside vehicle, remove cable clip (Fig. 32).

(4) Remove cable core wire at pedal arm.

(5) Remove cable housing from dash panel and pull cable into engine compartment.

(6) Remove cable cover (Fig. 33). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 33). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(7) Using 2 screwdrivers, pry cable connector socket from throttle lever ball (Fig. 34). **Be very careful not to bend throttle lever arm.**

If Equipped With Battery Tray Mounted Accelerator Pedal Position Sensor

The Throttle Control Cable connects the accelerator pedal to the Accelerator Pedal Position Sensor (APPS). A separate mechanical cable is not routed to the throttle body.

CAUTION: Be careful not to damage or kink cable core wire (within cable sheathing) while servicing accelerator pedal, cables or APPS.

(1) Disconnect both negative battery cables at both batteries.

(2) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 35). The plastic cable retainer snaps into pedal arm.

(3) Remove cable core wire at pedal arm.

(4) Remove APPS. Refer to (Diesel) Accelerator Pedal Position Sensor (APPS) Removal / Installation.

(5) From inside vehicle, remove cable clip (Fig. 35).

THROTTLE CONTROL CABLE (Continued)

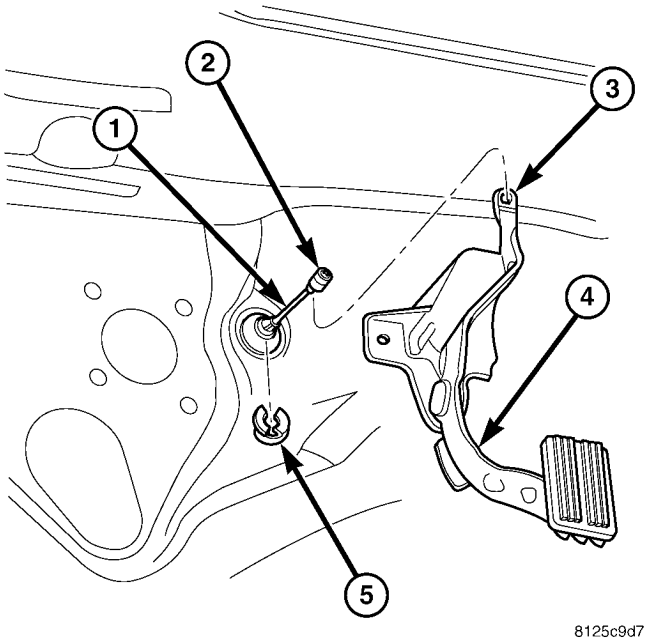

Fig. 32 ACCELERATOR PEDAL MOUNTING

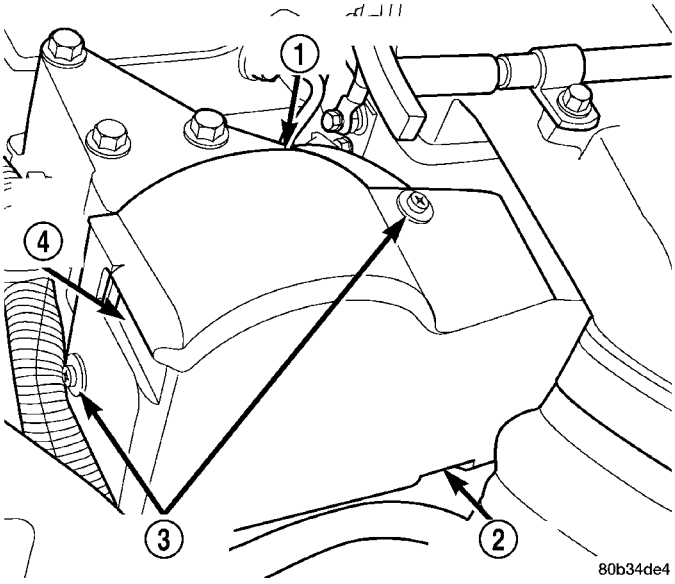

Fig. 33 CABLE/LEVER/THROTTLE LINKAGE COVER

1 - CABLE/LEVER/LINKAGE COVER
2 - PUSH UP LOWER TAB
3 - SCREWS/CLIPS (2)
4 - TAB PUSH HERE

(6) Remove cable housing from dash panel and pull cable into engine compartment.

(7) Remove cable housing at APPS bracket by pressing on release tab with a small screwdriver. **To prevent cable housing breakage, press on tab only enough to release cable from APPS bracket.**

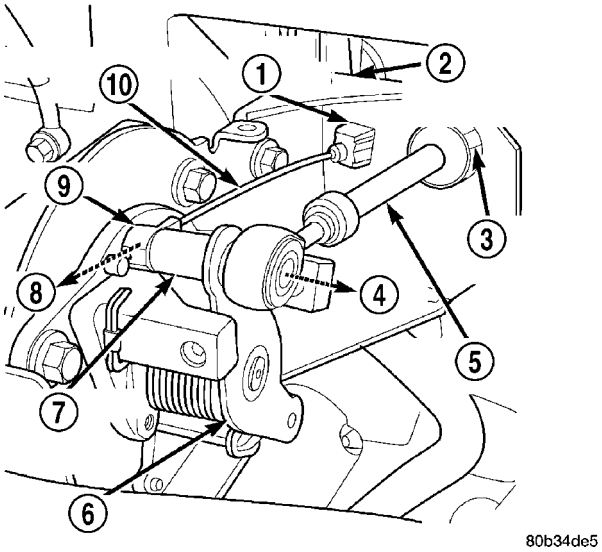

Fig. 34 SERVO CABLE AT THROTTLE LEVER

4 - OFF
5 - THROTTLE CABLE
6 - THROTTLE LEVER
7 - THROTTLE LEVER PIN
8 - OFF
9 - CONNECTOR
10 - SPEED CONTROL CABLE

INSTALLATION

Accelerator Pedal Position Sensor Mounted To Engine

(1) Install cable through mounting hole on cable mounting bracket (Fig. 34). Cable snaps into bracket. Be sure 2 pinch tabs are secure.

(2) Using large pliers, connect cable end socket to throttle lever ball (snaps on).

(3) Install remaining cable housing end into and through dash panel opening (snaps into position). The two plastic pinch tabs should lock cable to dash panel.

(4) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 32). Align index slot on plastic cable retainer to this index tab.

(5) Connect negative battery cables to both batteries.

(6) Before starting engine, operate accelerator pedal to check for any binding.

(7) Install cable/lever cover.

THROTTLE CONTROL CABLE (Continued)

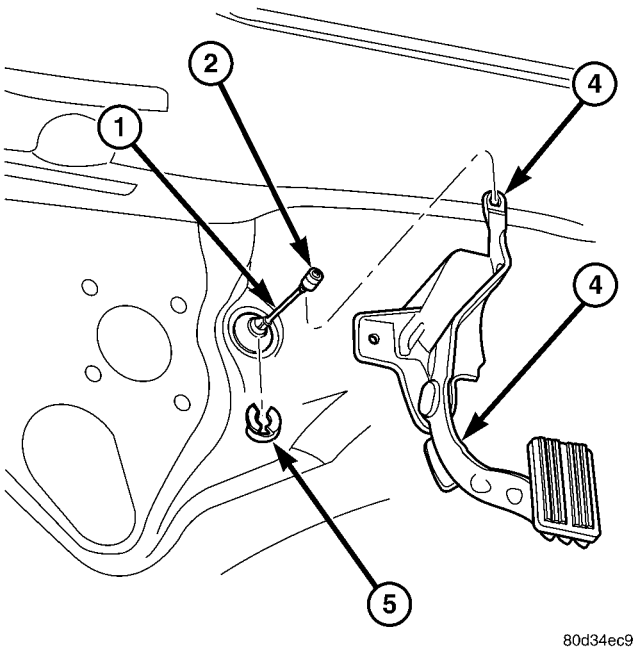

Fig. 35 ACCELERATOR PEDAL MOUNTING

1 - ACCELERATOR CABLE
2 - PLASTIC RETAINER (CLIP)
3 - THROTTLE PEDAL ARM
4 - PEDAL / BRACKET ASSEMBLY
5 - CABLE CLIP

Accelerator Pedal Position Sensor Not Mounted To Engine

(1) Attach cable to Accelerator Pedal Position Sensor (APPS). Refer to APPS (Diesel) Removal / Installation.

(2) Push cable housing into rubber grommet and through opening in dash panel.

(3) From inside vehicle, install clip holding cable to dashpanel (Fig. 35).

(4) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.

(5) Push cable retainer (clip) into pedal arm opening until it snaps in place.

(6) Before starting engine, operate accelerator pedal to check for any binding.

(7) If necessary, use DRB III® Scan Tool to erase any APPS Diagnostic Trouble Codes (DTC's) from Engine Control Module (ECM).

PTO SWITCH

DESCRIPTION

This Engine Control Module (ECM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

OPERATION

This input is used only to tell the PCM (non-diesel), or ECM (diesel) that the aftermarket PTO (Power Take Off) unit has been engaged. The PCM (or ECM) will disable (temporarily shut down) certain OBD II diagnostic trouble codes when the PTO unit is engaged.

STEERING

DESCRIPTION

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

Power steering systems consist of:
- Steering column
- Rack and pinion steering gear
- Belt driven hydraulic steering pump
- Pump pressure and return hoses
- Oil Cooler

OPERATION

The steering column shaft is attached to the gear pinion. The rotation of the pinion moves the gear rack from side-to-side. This lateral action of the rack pushes and pulls the tie rods to change the direction of the front wheels (Fig. 1).

Power assist is provided by an engine mounted hydraulic pump which supplies hydraulic fluid pressure to the steering gear.

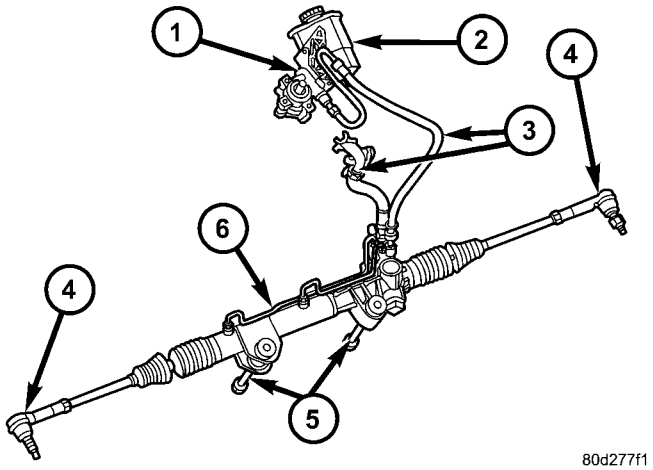

Fig. 1 STEERING COMPONENTS

STEERING (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING SYSTEM

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONAL HISS OR WHISTLE	1. Steering intermediate shaft to dash panel seal.	1. Check and repair seal at dash panel.
	2. Noisy valve in power steering gear.	2. Replace steering gear.
RATTLE OR CLUNK	1. Gear mounting bolts loose.	1. Tighten bolts to specification.
	2. Loose or damaged suspension components.	2. Inspect and repair suspension.
	3. Internal gear noise.	3. Replace steering gear.
	4. Pressure hose in contact with other components.	4. Reposition hose.
	5. Loose or damaged intermediate shaft or column.	5. Inspect and repair or replace.
CHIRP OR SQUEAL	1. Loose belt.	1. Adjust or replace.
WHINE OR GROWL	1. Low fluid level.	1. Fill to proper level.
	2. Pressure hose in contact with other components.	2. Reposition hose.
	3. Internal pump noise.	3. Replace pump.
	4. Air in fluid	4. Check for lekas, Evacuate air from P/S system.
SUCKING AIR SOUND	1. Loose return line clamp.	1. Replace clamp.
	2. O-ring missing or damaged on hose fitting.	2. Replace o-ring.
	3. Low fluid level.	3. Fill to proper level.
	4. Air leak between pump and reservoir.	4. Repair as necessary.
	5. Reservoir cap not installed correctly.	5. Install reservoir cap correctly.
SCRUBBING OR KNOCKING	1. Wrong tire size.	1. Verify tire size.

STEERING (Continued)

BINDING AND STICKING

CONDITION	POSSIBLE CAUSE	CORRECTION
DIFFICULT TO TURN WHEEL STICKS OR BINDS	1. Low fluid level.	1. Fill to proper level.
	2. Tire pressure.	2. Adjust tire pressure.
	3. Steering components (ball joints/tie rod ends).	3 Inspect and repair as necessary.
	4. Loose belt.	4. Adjust or replace.
	5. Low pump pressure.	5. Pressure test and replace if necessary.
	6. Column shaft coupler binding.	6. Replace coupler.
	7. Steering gear worn.	7. Replace gear.
	8. Pump seized / Stuck valve	8. Replace pump.

INSUFFICIENT ASST. OR POOR RETURN TO CENTER

CONDITION	POSSIBLE CAUSE	CORRECTION
HARD TURNING OR MOMENTARY INCREASE IN TURNING EFFORT	1. Tire pressure.	1. Adjust tire pressure.
	2. Low fluid level.	2. Fill to proper level.
	3. Loose belt.	3. Adjust or replace.
	4. Low pump pressure.	4. Pressure test and repair as necessary.
	5. Internal gear leak.	5. Replace gear.
STEERING WHEEL DOES NOT WANT TO RETURN TO CENTER POSITION	1. Tire pressure.	1. Adjust tire pressure.
	2. Wheel alignment.	2. Align front end.
	3. Lack of lubrication.	3. Inspect and lubricate suspension compnents.
	4. High friction in steering gear.	4. Replace gear.

LOOSE STEERING AND VEHICLE LEAD

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE PLAY IN STEERING WHEEL	1. Worn or loose suspension or steering components.	1. Inspect and repair as necessary.
	2. Worn or loose wheel bearings.	2. Inspect and repair or adjust bearings.
	3. Steering gear mounting.	3. Tighten gear mounting bolts to specification.
	4. Gear out of adjustment.	4. Replace gear.
	5. Worn or loose steering coupler.	5. Inspect and replace as necessary.
VEHICLE PULLS OR LEADS TO ONE SIDE.	1. Tire Pressure.	1. Adjust tire pressure.
	2. Radial tire lead.	2. Rotate tires.
	3. Brakes dragging.	3. Repair as necessary.
	4. Wheel alignment.	4. Align front end.

STEERING (Continued)

DIAGNOSIS AND TESTING - POWER STEERING FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 and (Fig. 2) Adapter Kit 6893.

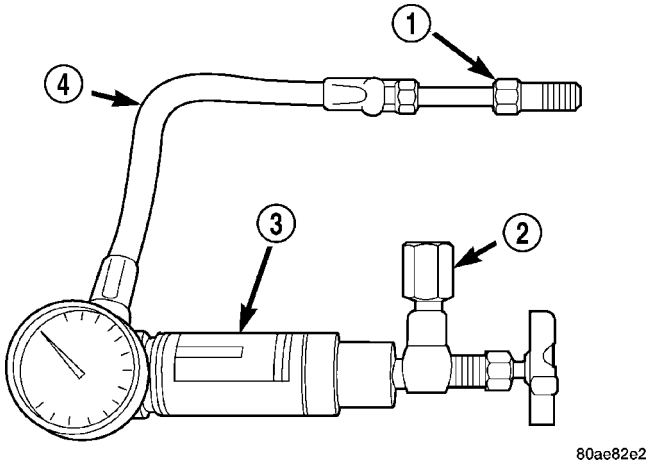

Fig. 2 Analyzer With Tube and Adapter

1 - TUBE
2 - ADAPTER FITTINGS
3 - ANALYZER
4 - GAUGE HOSE

FLOW AND PRESSURE TEST

(1) Check the power steering belt to ensure it is in good condition and adjusted properly.

(2) Connect pressure gauge hose from the Power Steering Analyzer to adapter 6826.

(3) Connect tube 6825A to Power Steering Analyzer test valve end.

(4) Disconnect the high pressure hose from the power steering pump.

(5) Connect the tube 6825A to the pump fitting.

(6) Connect the power steering hose from the steering gear to the adapter 6826.

(7) Open the test valve completely.

(8) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.

(9) Check fluid level, add fluid as necessary. Start engine again and let idle.

(10) Gauge should read below 862 kPa (125 psi), if above, inspect the hoses for restrictions and repair as necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).

(11) Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification, (refer to pump specification chart for GPM) the pump should be replaced.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

(12) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

(13) Open the test valve and turn the steering wheel to the extreme left and right positions three times against the stops. Record the highest pressure reading at each position. Compare readings to the pump specifications chart. If pressures readings are not within 50 psi of each other, the gear is leaking internally and must be replaced.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

PUMP SPECIFICATION

ENGINE	RELIEF PRESSURE ± 65	FLOW RATE (GPM) AT 1500 RPM
1500 series	11032 kPa (1615 ± 65 psi)	3.1 - 3.5
2500 & 3500 series	12400 kPa (1800 ± 50 psi)	3.5 - 4.0

COLUMN

DESCRIPTION

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

The tilt and standard column (Fig. 1) has been designed to be serviced as an assembly; less wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

To service the steering wheel, switches or airbag, refer to Restraints and follow all WARNINGS and CAUTIONS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the shaft or bearing.

CAUTION: Do not attempt to remove the pivot bolts to disassemble the tilting mechanism. Do not remove shaft lock plate or plate retainer. This will damage the column.

CAUTION: Do not attempt to remove or modify the park lock slider or link.

COLUMN (Continued)

NOTE: When servicing the steering wheel after removing the old bolt a new bolt must be used when installing.

NOTE: When servicing the coupler a new bolt must be used when installing.

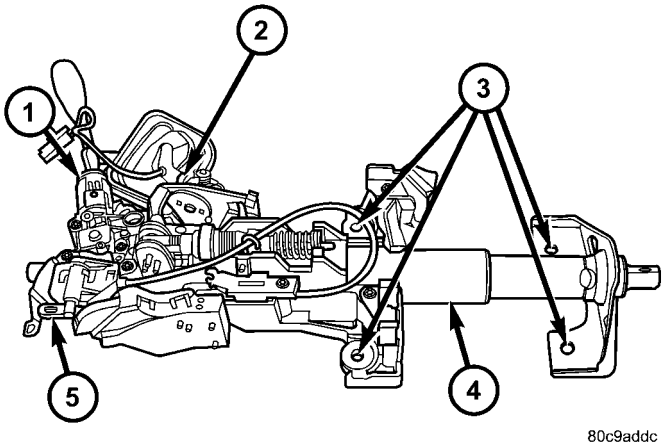

Fig. 1 STEERING COLUMN

1 - LOCK CYLINDER
2 - GEAR SHIFT LEVER
3 - MOUNTING HOLES
4 - STEERING COLUMN
5 - TILT LEVER

DIAGNOSIS AND TESTING - STEERING COLUMN

If the vehicle is involved in a front end collision/the air bag has deployed the column must be inspected. This inspection will determine if the Column has collapsed. Inspect the column mounting capsules visually and manually push and pull them to check for separation or fractures. If capsules are fractured or have moved the column MUST be replaced.

REMOVAL

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. REFER TO ELECTRICAL RESTRAINT SYSTEM FOR SERVICE PROCEDURES. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

(1) Position the front wheels **straight ahead**.
(2) Disconnect the negative (ground) cable from the battery.
(3) Remove the two switches from the steering wheel.
(4) Remove the airbag, (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).
(5) Remove the steering wheel with special tool CJ98–1 or an appropriate steering wheel puller.

CAUTION: Ensure the puller bolts are fully engaged into the steering wheel and not into the clockspring, before attempting to remove the wheel. Failure to do so may damage the steering wheel/ clockspring.

(6) Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
(7) Remove the tilt lever.
(8) Remove the column shrouds (Fig. 2).

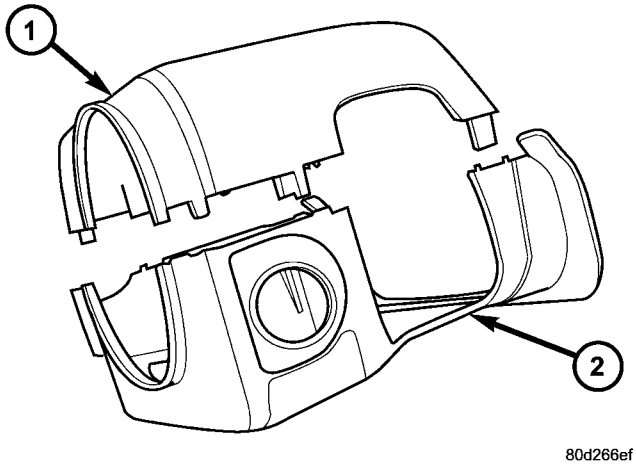

Fig. 2 UPPER & LOWER SHROUDS

1 - UPPER SHROUD
2 - LOWER SHROUD

(9) Remove the clock spring, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).
(10) Disconnect the wiring harness to the column.

COLUMN (Continued)

(11) Remove the shift cable from the column shift lever actuator (Refer to 21 - TRANSMISSION/ TRANSAXLE/AUTOMATIC - 32RH/GEAR SHIFT CABLE - REMOVAL). (Fig. 3).

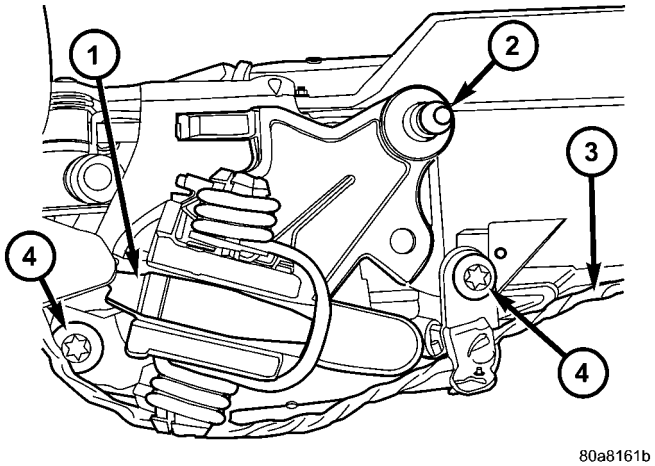

Fig. 3 SHIFT CABLE CONNECTOR

1 - Shift lever
2 - Cable Connection
3 - Overdrive Electrical Wiring
4 - Mounting Screws

(12) Release the shift cable from the column bracket and remove it from the bracket.

(13) Remove the SKIM module in order to disconnect the electrical connector.

(14) Remove the upper steering shaft coupler bolt and slide the shaft down (Fig. 4) & (Fig. 5)

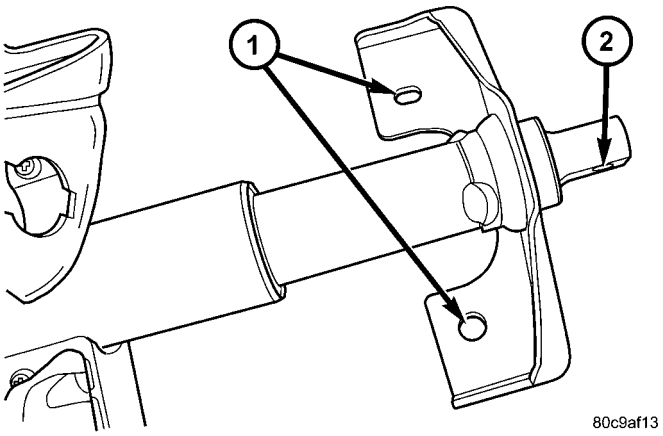

Fig. 4 COUPLER SHAFT

1 - MOUNTING HOLES
2 - COUPLER BOLT HOLE

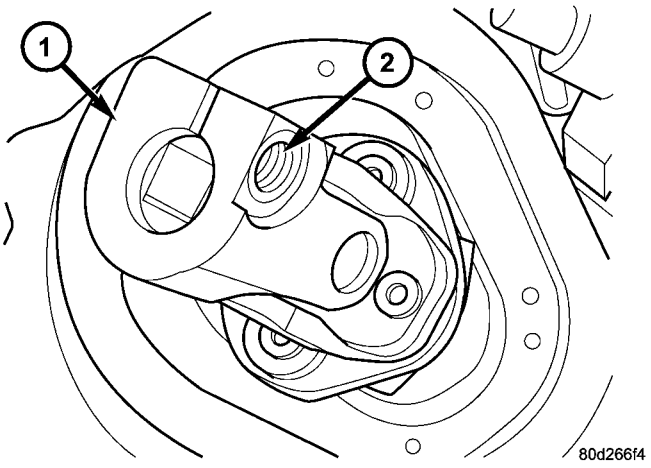

Fig. 5 UPPER STEERING COUPLER

1 - STEERING COUPLER
2 - PINCH BOLT HOLE

(15) Remove the brake light switch and discard (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).

(16) Remove the four steering column mounting nuts (Fig. 6).

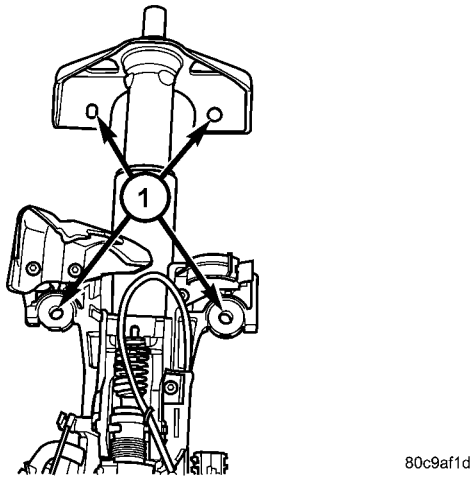

Fig. 6 MOUNTING HOLES

1 - MOUNTING HOLES

COLUMN (Continued)

(17) Remove the steering column assembly from the vehicle. (Fig. 7)

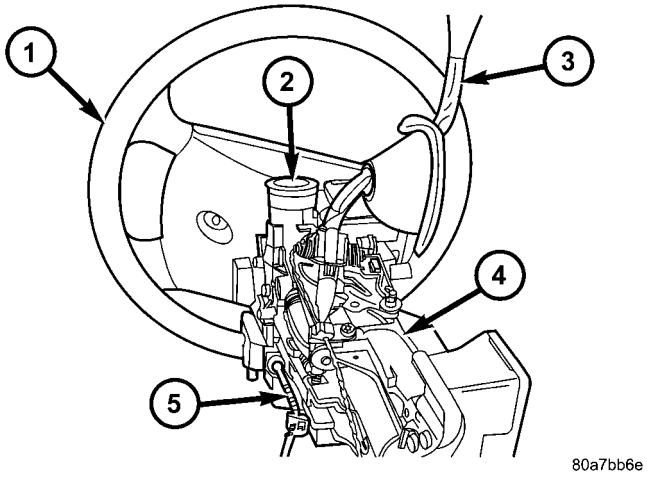

Fig. 7 STEERING COLUMN

1 - Steering Wheel
2 - Key Cylinder
3 - Gear Shift Lever
4 - Steering Column
5 - Tilt Lever Cable

INSTALLATION

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. REFER TO ELECTRICAL RESTRAINT SYSTEM FOR SERVICE PROCEDURES. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

(1) Position the steering column on the dash panel support and loosely install the mounting nuts.

(2) Firmly slide the steering column upward against the studs in dash panel and hand tighten the nuts.

(3) Install the steering shaft coupler on the steering shaft and loosely install a **new** bolt.

(4) Center steering column in dash opening and tighten mounting nuts to 28 N·m (250 in. lbs.).

NOTE: Torque the upper left nut first then the lower right nut. Then torque the lower left nut then the upper right nut.

NOTE: A new bolt must be used for reinstallation.

(5) Tighten the coupler bolt to 57 N·m (42 ft. lbs.).

(6) Install a new brake light switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - REMOVAL).

(7) Install the shifter cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 32RH/GEAR SHIFT CABLE - INSTALLATION)

(8) Connect the wiring harness to the column.

(9) Install the SKIM module.

(10) Install the clockspring(Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

(11) Install the shrouds.

(12) Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(13) Align the spline on the wheel hub to shaft.

(14) Then install the steering wheel and install a **new** bolt. Tighten the bolt to 61 N·m (45 ft. lbs.).

(15) Install the airbag (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

(16) Install the two steering wheel switches.

(17) Install the tilt lever handle.

(18) Install the negative battery terminal.

(19) Test the operation of the horn, Electronic PRNDL Indicator, lights and any other functions that are steering column operated.

IGNITION SWITCH

DESCRIPTION

The ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the shift cable. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

DIAGNOSIS AND TESTING - IGNITION SWITCH

TEST AND REPAIR

If the key removal effort is excessive on a vehicle with a automatic transmission first adjust the shift linkage, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 46RE/GEAR SHIFT CABLE - ADJUSTMENTS).

If the ignition switch effort is excessive remove the ignition key cylinder from the steering column. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER

IGNITION SWITCH (Continued)

HOUSING - REMOVAL). Check the turning effort of the key cylinder. If the ignition key cylinder effort is excessive replace the key cylinder.

REMOVAL

SERVICE PRECAUTIONS

NOTE: The steering column on vehicles equipped with an automatic transmission is not equipped with an internal locking shaft with the ignition cylinder. Alternative methods of locking the steering wheel for service will have to be used.

The tilt and standard column (Fig. 8) have been designed to be serviced as an assembly; without wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

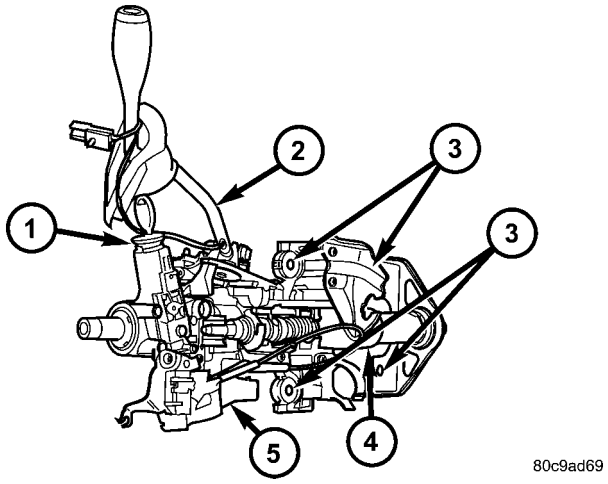

Fig. 8 STEERING COLUMN

1 - KEY CYLINDER
2 - GEAR SHIFT LEVER
3 - MOUNTING HOLES
4 - STEERING COLUMN
5 - IGNITION SWITCH

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or airbag, Refer to Electrical Restraints and follow all WARNINGS and CAUTIONS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the shaft or bearing.

CAUTION: Do not attempt to remove the pivot bolts to disassemble the tilting mechanism.

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

(1) Remove the negative (ground) cable from the battery.

(2) Disable the airbag, (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(3) Remove the lower and upper shrouds.

(4) Remove key cylinder. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - REMOVAL).

(5) Disconnect the lower clockspring connectors.

(6) Remove the wire retainer from the tilt lever bracket.

(7) Remove the tilt lever mounting screws to gain access to the ignition switch mounting screws. (Fig. 9)

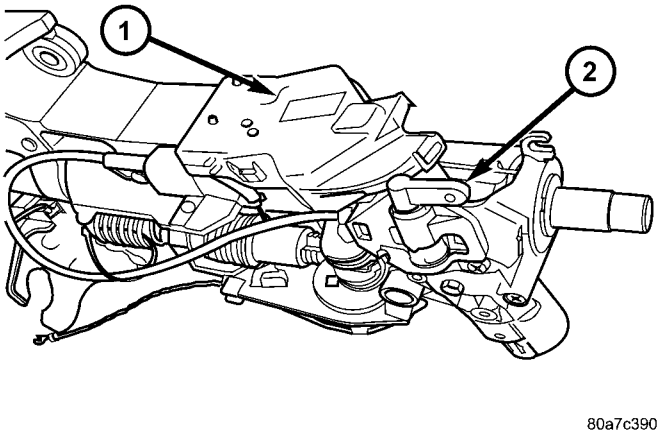

Fig. 9 IGNITION SWITCH WITH TILT

1 - IGNITION SWITCH
2 - TILT LEVER MECHANISM

IGNITION SWITCH (Continued)

(8) For columns without tilt remove the bracket to gain access to the ignition switch mounting screws. (Fig. 10)

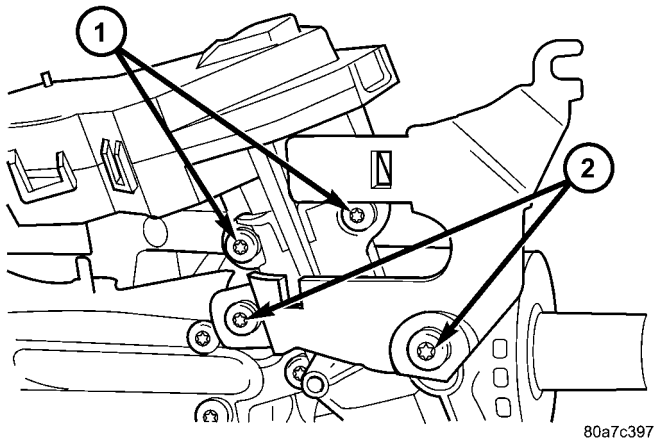

Fig. 10 IGNITION SWITCH WITHOUT TILT

1 - Ignition Switch Mounting Screws
2 - Non-Tilt Mounitng Bracket Screws

(9) Disconnect the electrical connector at rear of ignition switch (Fig. 11).

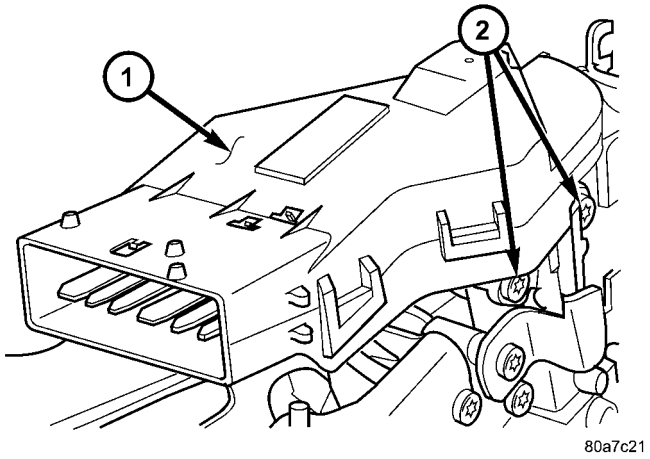

Fig. 11 IGNITION SWITCH

1 - Ignition Switch
2 - Ignition Switch Mounting Screws

(10) Remove ignition switch mounting screw.

(11) Using a small screwdriver, push on locking tab and remove switch from steering column.

INSTALLATION

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before installing ignition switch.

(1) Before installing ignition switch, rotate the slot in the switch to the ON position.

(2) Connect the electrical connector to rear of the ignition switch. Make sure that locking tabs are fully seated into wiring connector.

(3) Position switch to column and install the mounting screw. Tighten screw to 3 N·m (26 in. lbs.).

(4) Install the tilt lever bracket mounting screws. Tighten screws to 4.5 N·m (40 in. lbs.).

(5) If the column is non-tilt install the bracket. Tighten screws to 4.5 N·m (40 in. lbs.) (Fig. 10)

(6) Position the wire retainer into the tilt lever bracket.

(7) Reconnect the lower clockspring connectors.

(8) Install the key cylinder.

(9) Install steering column upper and lower shrouds.

(10) Enable the airbag system. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

KEY-IN IGNITION SWITCH

DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column. It closes a path to ground for the Central Timer Module (CTM) when the ignition key is inserted in the ignition key cylinder and the driver door ajar switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition key cylinder. The ground path is also opened when the driver door ajar switch is open (driver door is closed).

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced, (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

DIAGNOSIS AND TESTING - IGNITION SWITCH AND KEY LOCK CYLINDER

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to Ignition Switch in the appropriate section of Electrical Wiring Diagrams.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

(Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - DIAGNOSIS AND TESTING).

KEY CYLINDER

REMOVAL

The ignition key must be in the key cylinder for cylinder removal.

(1) Disconnect negative cable from battery.

(2) Remove upper and lower covers (shrouds) from steering column.

(3) Place shifter in PARK position.

(4) A retaining pin (Fig. 12) is located at side of key cylinder assembly.

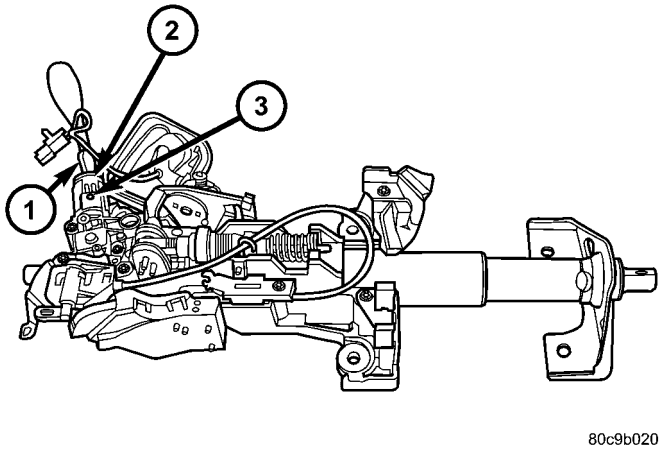

Fig. 12 KEY CYLINDER

1 - KEY
2 - KEY CYLINDER
3 - RETAINING PIN HOLE

(a) Rotate key to RUN position.

(b) Press in on retaining pin while pulling key cylinder from ignition switch (Fig. 13).

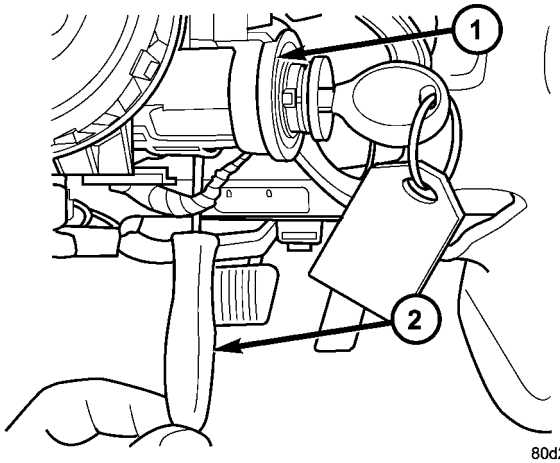

Fig. 13 KEY CYLINDER

1 - KEY CYLINDER
2 - PUNCH

INSTALLATION

The ignition key must be in the key cylinder for cylinder installation.

(1) Install the key cylinder into the housing using care to align the end of the key cylinder with the ignition switch.

(2) Push the key cylinder in until it clicks.

(3) Replace the upper and lower shrouds.

(4) Reconnect the battery.

GEAR SHIFT LEVER

REMOVAL

(1) Remove the kneeblocker. (Refer to 23 - BODY/ INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).

(2) Remove the upper and lower column shroud.

(3) Remove and discard the brake light switch.

(4) Loosen the column bolts and lower the column enough to allow clearance for the gear shift lever removal.

(5) Disconnect the overdrive switch harness (if equipped).

(6) Disconnect the shift cable from the shift lever.

(7) Remove the SKIM.

(8) Remove the gear shift lever mounting screws and remove the lever. (Fig. 14)

(9) Remove the blocker pin from the inhibit link slot (Fig. 14).

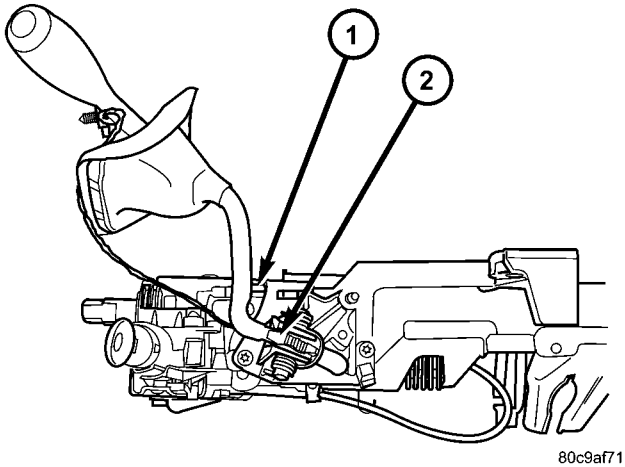

Fig. 14 GEAR SHIFT LEVER

1 - PARK INHIBIT BLOCKER SPRING
2 - GEAR SHIFT LEVER

INSTALLATION

(1) Install the lever assembly using care to install the pin in the blocker to slider slot (Fig. 15) and install the mounting screws and tighten to 12 N·m (105 in. lbs.).

GEAR SHIFT LEVER (Continued)

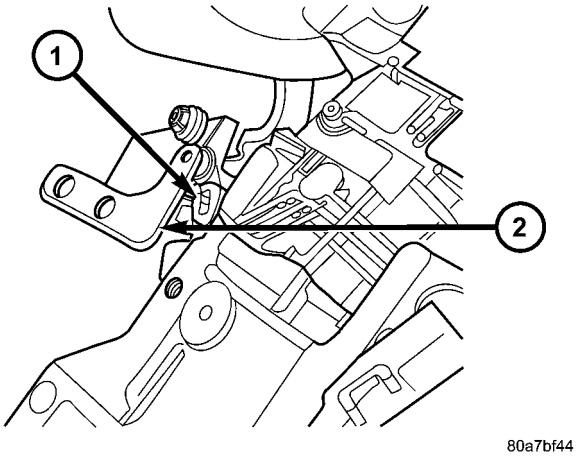

Fig. 15 GEAR SHIFT LEVER SPRING

1 - BLOCKER TO INHIBIT LINK SLOT
2 - GEAR SHIFT LEVER

(2) Cycle the key from ACC to RUN and ensure that the blocker does not stick or bind.

(3) Turn the key to the OFF position and ensure that the shifter will not pull from the PARK position.

(4) Connect the over drive switch harness (if equipped).

NOTE: Route and tie off harness to original location.

(5) Connect the shift cable to the lever.

(6) Ensure the gear shift lever and transmission are in the PARK position and snap the cable adjust clip in place.

(7) Install a new brake light switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - INSTALLATION).

(8) Install the SKIM and halo.

(9) Install the upper and lower column shroud.

(10) Install the column back into place and tighten.

(11) Install the kneeblocker. (Refer to 23 - BODY/ INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).

UPPER STEERING COUPLING

REMOVAL

(1) Disconnect the negative battery cable.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

(2) Lock the steering wheel with the tire in the straight position.

(3) Remove and discard the lower pinch bolt.

(4) Lower the steering coupler shaft from the column.

(5) Remove the upper steering coupling shaft seal by pushing in the four tags securing it to the panel (Fig. 16).

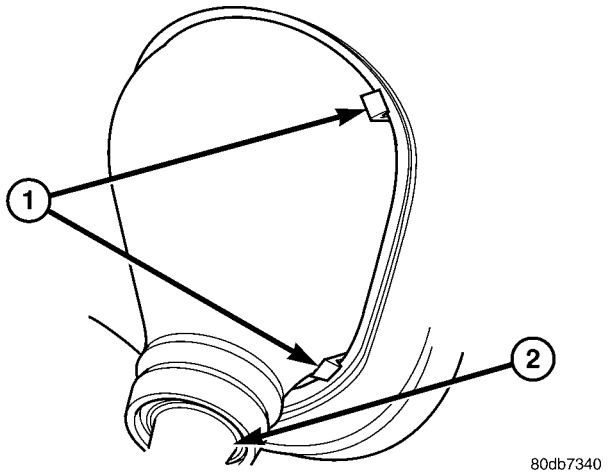

Fig. 16 RELEASE TANGS

1 - RELEASE TANGS (4)
2 - UPPER STEERING COUPLER SHAFT

(6) Remove and discard the lower coupler pinch bolt from the lower steering coupling shaft (Fig. 17).

(7) Remove the upper steering coupling shaft from the vehicle (Fig. 17).

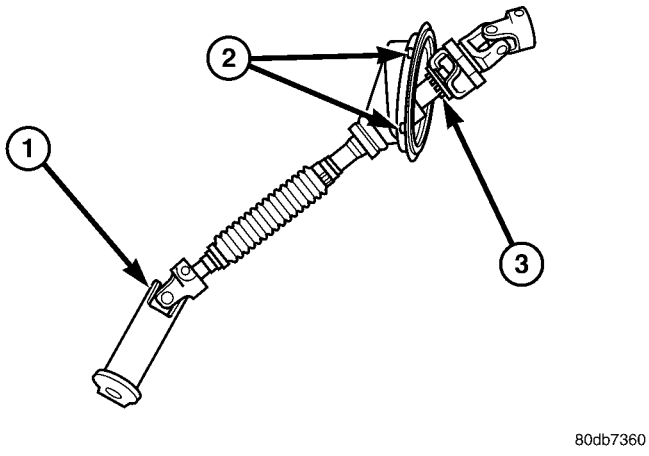

Fig. 17 UPPER STEERING COUPLER SHAFT

1 - LOWER STEERING COUPLER
2 - RELEASE TANGS (4)
3 - UPPER STEERING COUPLER SHAFT

INSTALLATION

(1) Install the upper steering coupling shaft to the vehicle (Fig. 17).

UPPER STEERING COUPLING (Continued)

(2) Install the upper steering coupling shaft seal by pushing it in securing the four tangs to the panel (Fig. 16).

NOTE: Note: A new steering coupling shaft pinch bolt for the upper and lower shafts must be used.

(3) Install the steering coupler shaft to the column (Fig. 17).
(4) Install the upper pinch bolt use new bolt and tighten to 57 N.m (42 ft.lbs).
(5) Install the shaft to the lower coupler (Fig. 17).
(6) Install the lower pinch bolt use new bolt and tighten to 57 N.m (42 ft.lbs).
(7) Unlock the steering wheel.
(8) Reconnect the negative battery cable.

LOWER STEERING COUPLING

REMOVAL

REMOVAL - ALL LD & HD EXCEPT 4X4 HD

(1) Disconnect the negative battery cable.
(2) Raise and support the vehicle.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

(3) Lock the steering wheel with the tire in the straight position.
(4) Remove the left front tire and wheel assembly.
(5) Mark both coupler connections for proper installation.
(6) Remove and discard the upper coupler pinch bolt.
(7) Remove and discard the lower coupler pinch bolt.
(8) Remove the lower steering shaft coupler (Fig. 18).

REMOVAL - 4X4 HD

(1) Disconnect the negative battery cable.
(2) Raise and support the vehicle.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

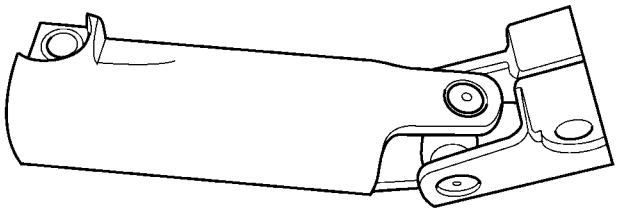

Fig. 18 LOWER STEERING COUPLER

(3) Lock the steering wheel with the tire in the straight position.
(4) Remove the left front tire and wheel assembly.
(5) Remove and discard the upper coupler pinch bolt (Fig. 20).
(6) Remove and discard the lower coupler pinch bolt (Fig. 19).

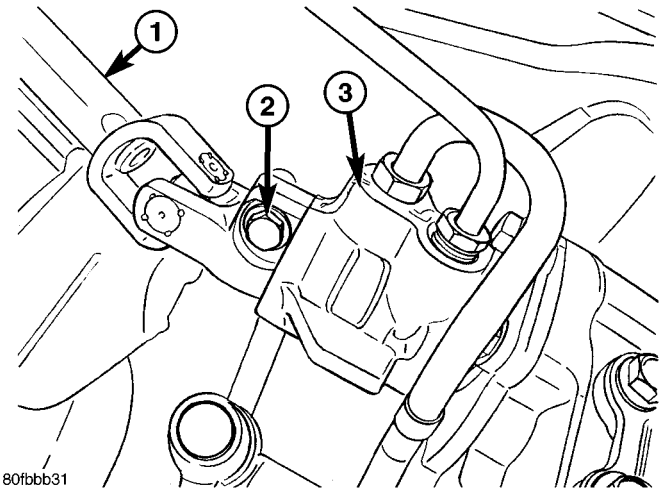

Fig. 19 LOWER COUPLER PINCH BOLT

1 - INTERMEDIATE STEERING SHAFT
2 - LOWER COUPLING BOLT
3 - STEERING GEAR

(7) Remove the lower steering shaft coupler (Fig. 20).

INSTALLATION

INSTALLATION - ALL LD & HD EXCEPT 4X4 HD

(1) Install the coupler to the steering rack & pinion using the marks made in the removal process.

LOWER STEERING COUPLING (Continued)

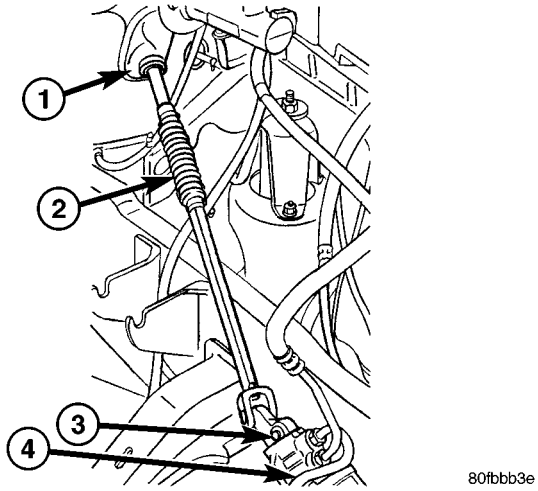

Fig. 20 INTERMEDIATE STEERING SHAFT

1 - UPPER COUPLING BOOT AND BOLT
2 - INTERMEDIATE STEERING SHAFT
3 - LOWER COUPLING BOLT
4 - STEERING GEAR

(2) Install the coupler to the intermediate shaft using the marks made in the removal process.

NOTE: New pinch bolts must be used for reinstallation.

(3) Install the lower pinch bolt and tighten to 57 N·m (42 ft. lbs.).
(4) Install the upper pinch bolt and tighten to 57 N·m (42 ft. lbs.).
(5) Install the left front tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
(6) Lower the vehicle.
(7) Reconnect the negative battery cable.
(8) Unlock the steering wheel.

INSTALLATION - 4X4 HD

(1) Install the coupler to the steering gear.
(2) Install the coupler to the intermediate shaft.

NOTE: New pinch bolts must be used for reinstallation.

(3) Install the lower pinch bolt and tighten to 28 N·m (250 in. lbs.).
(4) Install the upper pinch bolt and tighten to 57 N·m (42 ft. lbs.).
(5) Install the left front tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
(6) Lower the vehicle.
(7) Reconnect the negative battery cable.
(8) Unlock the steering wheel.

STEERING WHEEL

REMOVAL

(1) Disable and remove the driver's side airbag.(Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
(2) Partially remove the steering wheel bolt and leave the bolt in the column.
(3) Install puller CJ98-1 or equivalent using the top of the bolt to push on. (Fig. 21)

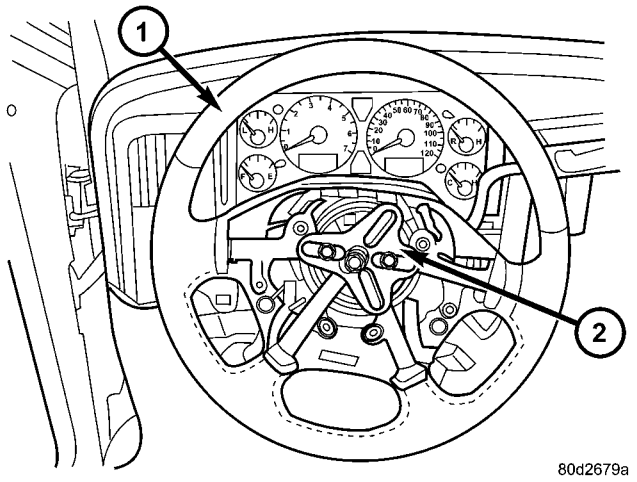

Fig. 21 STEERING WHEEL PULLER

1 - STEERING WHEEL
2 - SPECIAL TOOL CJ98-1

(4) Remove and discard the steering wheel bolt.
(5) Remove the steering wheel.

INSTALLATION

NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)

(1) Install steering wheel to the column

NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

(2) Install the new steering wheel bolt. Tighten the bolt to 61 N·m (45 ft. lbs.).
(3) Install the driver's side air bag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

TILT LEVER KNOB RELEASE

REMOVAL

(1) Remove the tilt lever handle.
(2) Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
(3) Remove the lower shroud.

NOTE: Use special care not to pry on the clockspring electrical connector when removing or installing the mounting screw located next to the clockspring.

(4) Remove the two mounting screws from the tilt lever knob release bracket (Fig. 22).
(5) Disconnect the electrical harness plastic mounting tab from the the bracket (Fig. 22).

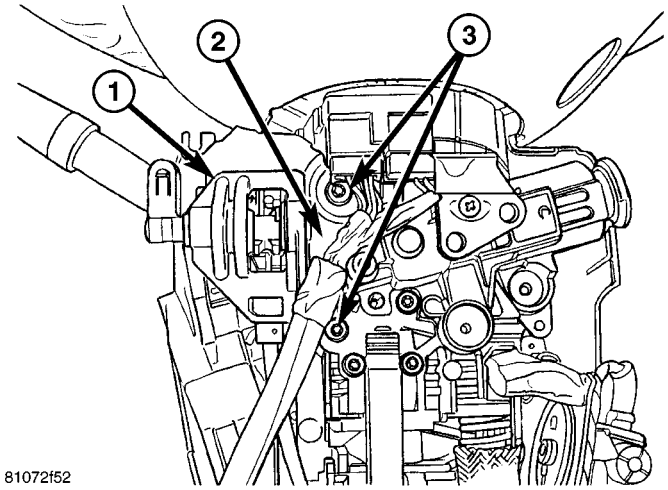

Fig. 22 TILT LEVER KNOB RELEASE BRACKET

1 - TILT LEVER RELEASE KNOB BRACKET
2 - ELECTRICAL HARNESS TAB
3 - MOUNTING SCREWS (2)

(6) Unsnap the cable from the bracket (Fig. 23).
(7) Remove the end of the cable from the tilt lever knob release bracket (Fig. 24).

INSTALLATION

(1) Route the cable into the tilt lever release knob bracket (Fig. 24).
(2) Snap the cable end into the bracket (Fig. 23).

NOTE: Use special care not to pry on the clockspring electrical connector when removing or installing the mounting screw located next to the clockspring.

NOTE: New screws should be used when installing the tilt lever release knob bracket to the column.

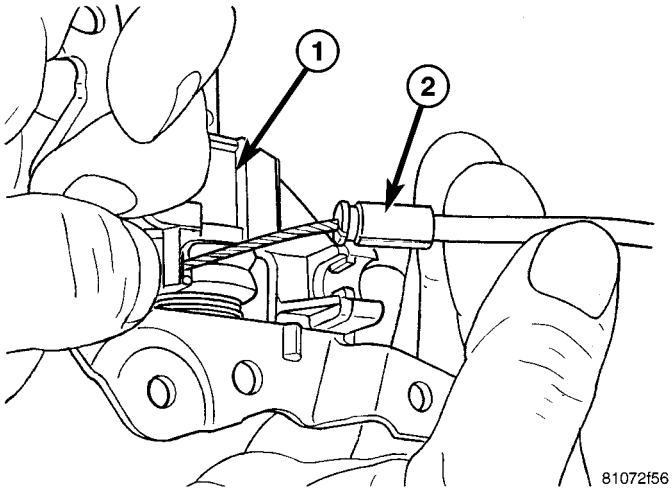

Fig. 23 CABLE UNSNAPPED

2 - TILT LEVER CABLE REMOVAL/INSTALL

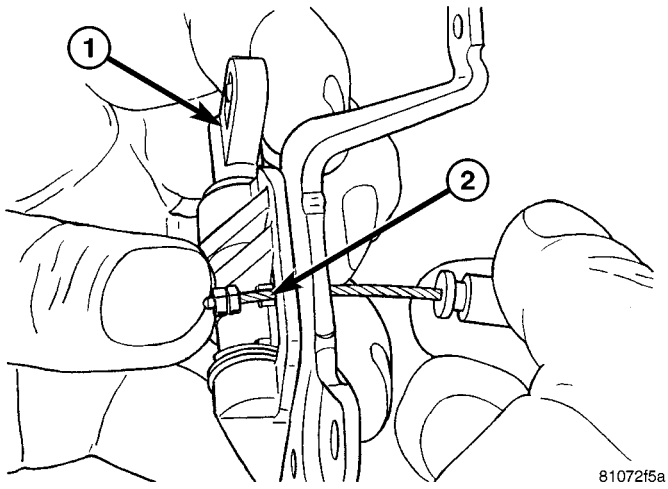

Fig. 24 END OF CABLE TO THE TILT LEVER RELEASE KNOB

1 - TILT LEVER RELEASE KNOB BRACKET
2 - END OF CABLE REMOVAL/INSTALL

(3) Install the tilt lever release knob bracket to the column and install the two new mounting screws (Fig. 22) Tighten the two new screws to 4.5 N·m (40 in. lbs.).
(4) Install the electrical harness plastic mounting tab to the bracket (Fig. 22).
(5) Install the lower shroud.
(6) Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
(7) Install the tilt lever handle.

GEAR - INDEPENDENT FRONT SUSPENSION

DESCRIPTION

A rack and pinion steering gears (Fig. 1) is made up of two main components, the pinon shaft and the rack. The gear cannot be adjusted or internally serviced. If a malfunction or a fluid leak occurs, the gear must be replaced as an assembly.

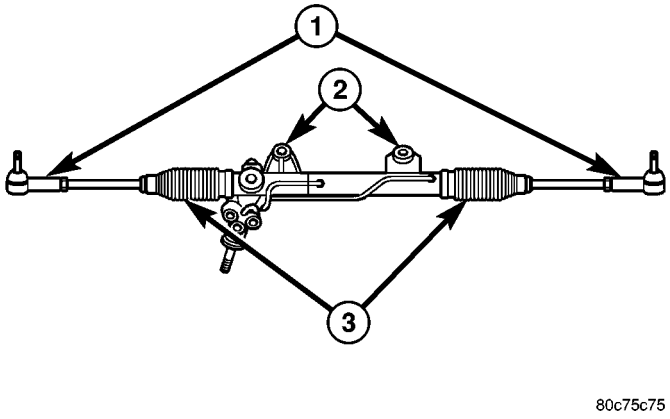

Fig. 1 STEERING GEAR

1 - OUTER TIE ROD ENDS
2 - MOUNTING BUSHINGS
3 - BELLOWS

REMOVAL

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

(1) Lock the steering wheel.
(2) Drain and siphon the power steering fluid from the reservoir.
(3) Raise the vehicle.
(4) Remove and discard the steering coupler pinch bolt.
(5) Remove the power steering hoses from the rack & pinion.
(6) Remove the tire and wheel assembly.
(7) Remove the tie rod end nuts and separate tie rod ends from the knuckles with Special tool 8677 (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).
(8) Remove the skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
(9) Remove the rack & pinion mounting bolts. (Fig. 2) & (Fig. 3)
(10) Remove the rack & pinion from the vehicle.

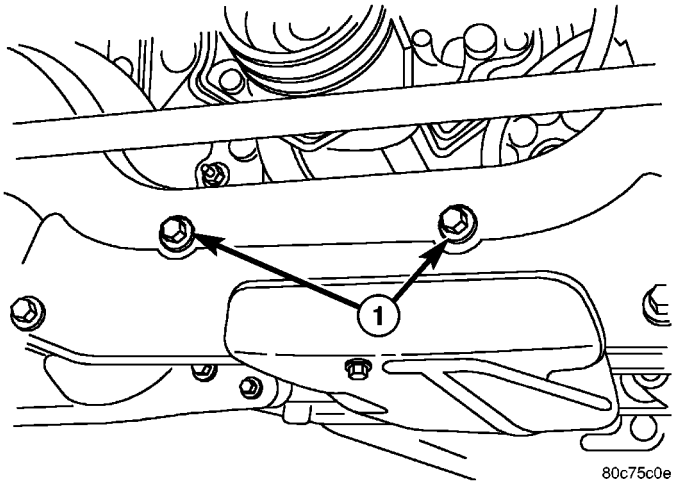

Fig. 2 STEERING GEAR MOUNTING BOLTS

GEAR - INDEPENDENT FRONT SUSPENSION (Continued)

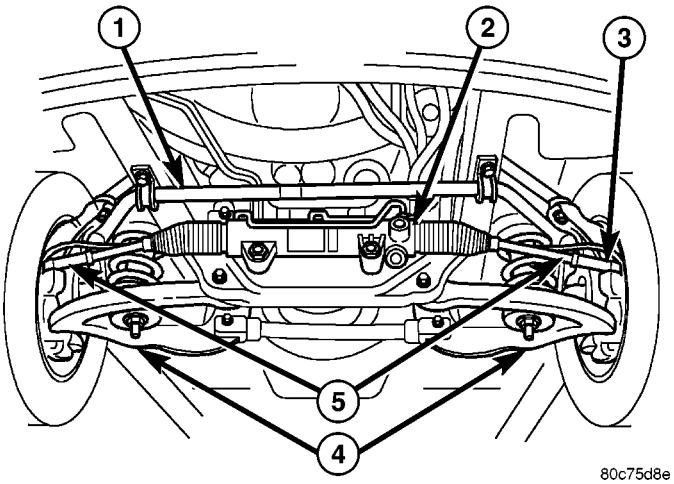

Fig. 3 STEERING GEAR 4X2

1 - SWAY BAR
2 - STEERING GEAR
3 - LEFT OUTER TIE ROD END
4 - LOWER CONTROL ARMS
5 - LEFT INNER & RIGHT OUTER (TIE ROD ENDS)

INSTALLATION

NOTE: Before installing gear inspect bushings and replace if worn or damaged.

NOTE: In the frame there is two holes for the mounting of the steering gear one is slotted and one is round, When tightening the gear to specifications make sure to tighten the mounting bolt with the hole first to avoided movement of the steering gear.

(1) Install the gear on the front crossmember and tighten the mounting bolts to 319 N·m (235 ft. lbs.). (Fig. 4) & (Fig. 3).

(2) Slide the shaft coupler onto the gear. Install **new** pinch bolt and tighten to 49 N·m (36 ft. lbs.).

(3) Clean and dry the tie rod end studs and the knuckle tapers.

(4) Install the tie rod ends into the steering knuckles and tighten the nuts to 61 N·m (45 ft. lbs.) then an additional 90°. (Refer to 19 - STEERING/LINKAGE/TIE ROD END - INSTALLATION).

(5) Install the pressure power steering hose to the steering gear and tighten to 32 N·m (23 ft. lbs.). (Refer to 19 - STEERING/PUMP/HOSES - INSTALLATION).

(6) Install the return power steering hose to the steering gear and tighten to 71 N·m (52 ft. lbs.). (Refer to 19 - STEERING/PUMP/HOSES - INSTALLATION).

(7) Install the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).

(8) Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(9) Remove the support and lower the vehicle.

(10) Fill the system with fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(11) Adjust the toe position. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

BUSHING

REMOVAL

(1) Remove the steering gear (Refer to 19 - STEERING/GEAR - REMOVAL).

CAUTION: Do not overtighten the vise on the gear case.

(2) Mount the steering gear in a soft jawed vise.

NOTE: If the bushings are seized a brass punch can be used to remove the bushings from the gear using care not to strike the gear.

(3) Remove the front mounting bushings.
(4) Remove the rear mounting bushings.
(5) Remove the steering gear from the vise and place it on the bench.

INSTALLATION

NOTE: Coat all bushings with a thin rubber lubricate oil prior to installation.

NOTE: A rubber mallet can be used to assist in the installation of the bushings once lubricated.

(1) Coat the rear bushings with a thin rubber lubricate oil then install the rear bushings using a rubber mallet to seat the bushings in the gear.
(2) Coat the front bushings with a thin rubber lubricate oil then install the front bushings using a rubber mallet to seat the bushings in the gear.
(3) Install the steering gear (Refer to 19 - STEERING/GEAR - INSTALLATION).
(4) Adjust the toe position (if necessary) (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

GEAR - LINK/COIL

DESCRIPTION

The power steering gear is a recirculating ball type gear (Fig. 1). The gear ratio's used are 12.5:1.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft, turns the pitman shaft, which turns the steering linkage.

REMOVAL

(1) Place the front wheels in a straight-ahead position.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

(2) Lock the steering wheel.

(3) Siphon out as much power steering fluid as possible.

4 - VALVE ASSEMBLY HOUSING
5 - PITMAN SHAFT COVER BOLTS
6 - STEERING GEAR
7 - MESHLOAD ADJUSTER NUT
8 - PITMAN SHAFT

GEAR - LINK/COIL (Continued)

(4) Disconnect and cap the fluid hoses from steering gear (Refer to 19 - STEERING/PUMP/HOSES - REMOVAL).

(5) Remove coupler pinch bolt at the steering gear and slide shaft off gear (Fig. 2).

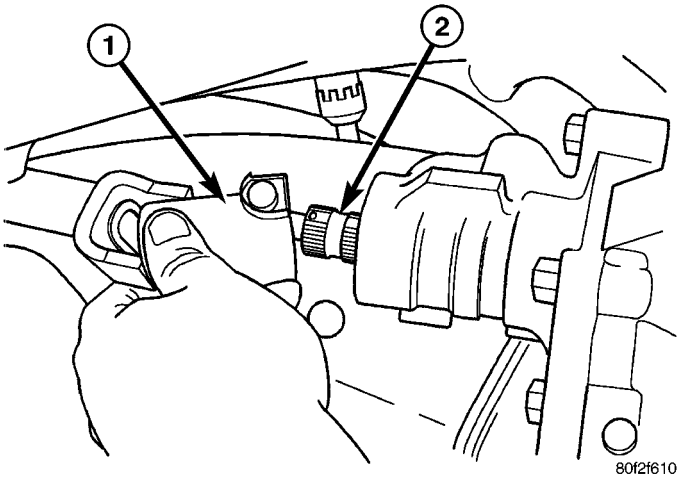

Fig. 2 COLUMN SHAFT

1 - STEERING COUPLER
2 - STEERING GEAR INPUT SHAFT

(6) Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from the shaft with Puller C-4150A (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL), (Fig. 3).

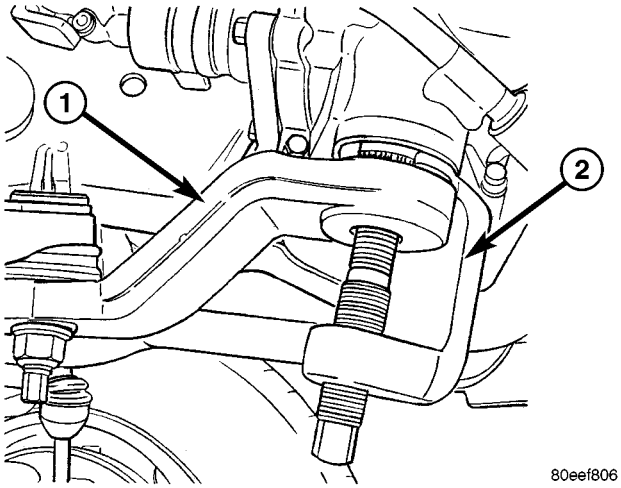

Fig. 3 PITMAN ARM REMOVAL

1 - PITMAN ARM
2 - C-4150A PULLER

(7) Remove steering gear three mounting bolts (Fig. 4). Remove the steering gear from the vehicle.

INSTALLATION

(1) Position the steering gear on the frame rail and install the three mounting bolts (Fig. 4). Tighten the mounting bolts to 196 N·m (145 ft. lbs.).

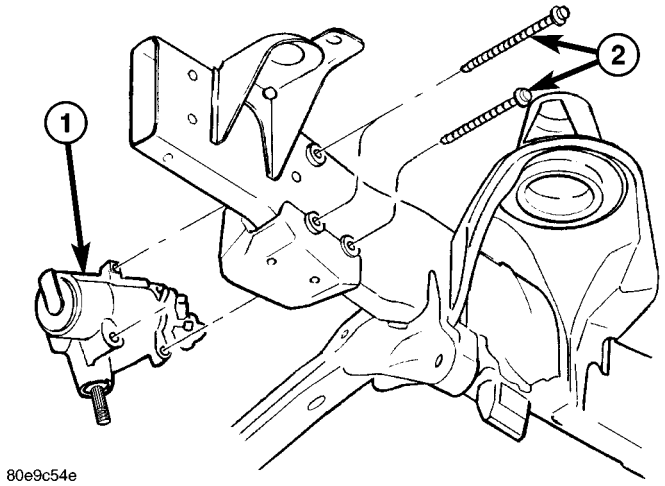

Fig. 4 STEERING GEAR REMOVAL/INSTALLATION

1 - STEERING GEAR
2 - MOUNTING BOLTS (3)

(2) Align steering coupler on gear shaft. Install pinch bolt and tighten to 49 N·m (36 ft. lbs.) torque.

(3) Align and install the pitman arm (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - INSTALLATION).

(4) Install the washer and retaining nut on the pitman shaft. Tighten the nut to 305 N·m (225 ft. lbs.).

(5) Connect fluid hoses to steering gear (Refer to 19 - STEERING/PUMP/HOSES - INSTALLATION), tighten to 31 N·m (23 ft. lbs.).

(6) Add fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(7) Reset the toe and center the steering wheel (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

ADJUSTMENTS

ADJUSTMENT

CAUTION: Steering gear must be adjusted in the proper order. If adjustments are not performed in order, gear damage and improper steering response may result.

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

(1) Remove the steering gear from the vehicle (Refer to 19 - STEERING/GEAR - REMOVAL).

(2) Mount the gear carefully into a soft-jawed vise.

GEAR - LINK/COIL (Continued)

CAUTION: Do not overtighten the vise on the gear case. This may affect the adjustment

(3) Hold the steering gear upside down over a drain pan and rotate the input shaft back and forth several times lock-to-lock to discharge the fluid from the steering gear

(4) Rotate the input shaft to the left stop and then back-off approximately 45 degrees. Using an inch-pound torque wrench on the input shaft, record the peak torque required to slowly and evenly rotate the input shaft clockwise ½ turn (180 degrees) starting from the 45 degree position. This peak torque reading is the preload torque. The preload torque must be within 2 - 10 in-lbs.

(5) Rotate the input shaft to its center of travel (approximately 1.5 turns from either stop). Place the torque wrench on the input shaft with the handle in the vertical position. Rotate the torque wrench slowly and evenly ¼ turn (90 degrees) each side of center and record the peak torque measure on or near center. This total on-center torque reading must be 5 - 9 in-lbs higher than the previously measured preload torque without exceeding a total of 17 in-lbs. The value of the total on-center minus the preload torque is defined as the meshload torque

(6) If required, adjust the on-center torque by loosening the adjuster screw lock nut and turning the adjuster screw until the total on-center and meshload torque readings fall within the specified values. Turn the adjuster screw clockwise to increase and counter-clockwise to decrease the torque reading. While holding the adjuster screw in place, tighten the lock nut to 31 N·m (23 ft. lbs.).

(7) Re-check the preload and on-center torque readings.

(8) Install pitman arm on the steering gear (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - INSTALLATION).

(9) Reinstall steering gear to the vehicle (Refer to 19 - STEERING/GEAR - INSTALLATION).

REMOVAL

REMOVAL - GAS ENGINE

(1) Seperate the pitman arm from the gear box (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL).

(2) Clean exposed end of pitman shaft and housing with a wire brush.

(3) Rotate the steering wheel from stop to stop and count the number of turns.

(4) Center the steering wheel by rotating it from the stop back 1 1/2 turns to achieve center position.

(5) Remove the pitman shaft cover bolts.

NOTE: The pitman shaft will not clear the housing if it is not centered.

(6) Remove the pitman shaft from the gear.

(7) Remove dust seal from the housing with a special tool (Fig. 5).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

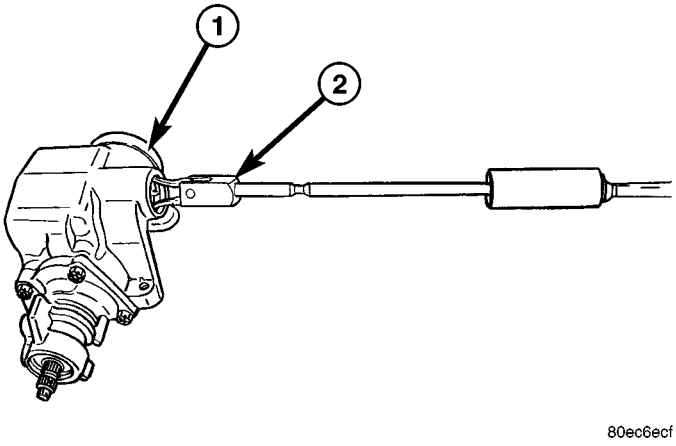

Fig. 5 SLIDE HAMMER

1 - STEERING GEAR
2 - SLIDE HAMMER C-3752 USED WITH SPECIAL TOOL ADAPTER 8990

(8) Remove retaining ring with snap ring pliers.

(9) Remove washer from the housing.

NOTE: Tighten the slide hammer adapter 8990 into the seal using wrenches, in order to make a tight fit to pull the seal out. If this is not performed the seal may tear on the removal making it difficult to remove.

(10) Remove oil seal from the housing with a special tool 8990 with slide hammer C-3752.

REMOVAL - DIESEL

(1) Seperate the pitman arm from the gear box (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL).

(2) Remove the steering gear box (Refer to 19 - STEERING/GEAR - REMOVAL).

(3) Install the steering gear in a soft jawed bench vise.

(4) Clean exposed end of pitman shaft and housing with a wire brush.

(5) Rotate the input shaft with a 12 point socket from stop to stop and count the number of turns (Fig. 6).

(6) Center the input shaft by rotating it from the stop 1/2 of the total amount of turns (Fig. 6).

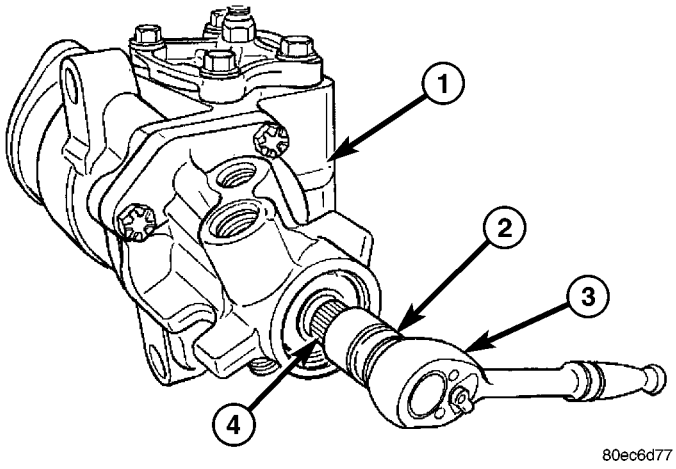

Fig. 6 CENTERING STEERING GEAR

1 - STEERING GEAR
2 - 12 POINT SOCKET
3 - RATCHET
4 - INPUT SHAFT

(7) Remove the pitman shaft cover bolts.

NOTE: The pitman shaft will not clear the housing if it is not centered.

(8) Remove the pitman shaft from the gear.

(9) Remove dust seal from the housing with a special tool 8990 (Fig. 5).

CAUTION: Use care not to score the housing bore when prying out seals.

(10) Remove retaining ring with snap ring pliers.

(11) Remove washer from the housing.

PITMAN SHAFT SEAL (Continued)

NOTE: Tighten the slide hammer adapter 8990 into the seal using wrenches, in order to make a tight fit to pull the seal out. If this is not performed the seal may tear on the removal making it difficult to remove.

(12) Remove oil seal from the housing with a special tool 8990 with slide hammer C-3752. (Fig. 5).

INSTALLATION

INSTALLATION - GAS ENGINE

NOTE: Generous amounts of the high temperature grease from the seal kit should be applied to areas between the pitman shaft bearing and oil seals and also between the dust seals and snap ring.

(1) Coat the oil seal and washer with **high temp grease**.

NOTE: Install the oil seal with the lip facing inward. Flat side of the oil seal should be against the washer.

(2) Install the oil seal with special tool 8989 driver and C-4171 handle (Fig. 7).

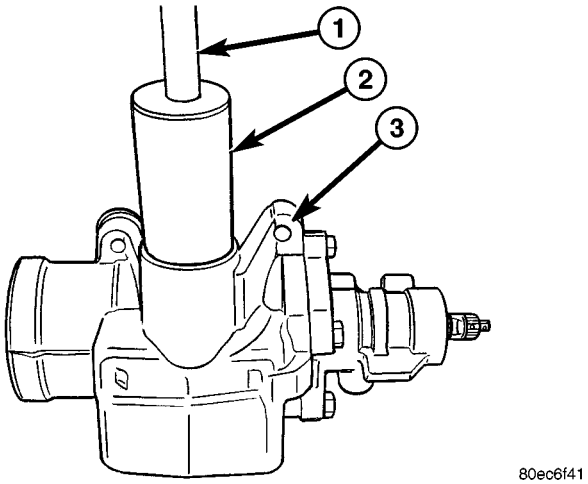

Fig. 7 SEAL INSTALLATION

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL 8989
3 - STEERING GEAR

(3) Install backup washer.
(4) Install the retainer ring with snap ring pliers.
(5) Coat the dust seal with **high temp grease**.
(6) Install the dust seal with a driver and handle (Fig. 7).
(7) Install protective seal protector 8993 over the shaft (Fig. 8).

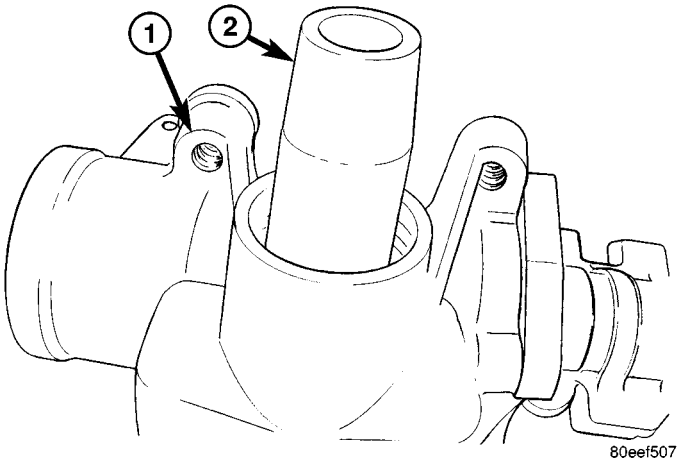

Fig. 8 PITMAN SHAFT SEAL PROTECTOR

1 - STEERING GEAR
2 - SPECIAL TOOL 8993

(8) Install the pitman shaft into the steering gear until it fully seats into the bearing.
(9) Install the new cover bolts and tighten to 68 N·m (50 ft. lbs.).
(10) Install the pitman arm (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - INSTALLATION).

INSTALLATION - DIESEL

NOTE: Generous amounts of the high temperature grease from the seal kit should be applied to areas between the pitman shaft bearing and oil seals and also between the dust seals and snap ring.

(1) Coat the oil seal and washer with **high temp grease**.

NOTE: Install the oil seal with the lip facing inward. Flat side of the oil seal should be against the washer.

(2) Install the oil seal with special tool 8989 driver and C-4171 handle (Fig. 7).
(3) Install backup washer.
(4) Install the retainer ring with snap ring pliers.
(5) Coat the dust seal with **high temp grease**.
(6) Install the dust seal with special tool 8989 driver and C-4171 handle (Fig. 7).
(7) Install protective seal protector 8993 over the shaft (Fig. 8).
(8) Install the pitman shaft into the steering gear until it fully seats into the bearing.
(9) Install the new cover bolts and tighten to 68 N·m (50 ft. lbs.).
(10) Install the steering gear (Refer to 19 - STEERING/GEAR - INSTALLATION).

PITMAN SHAFT SEAL (Continued)

(11) Install the pitman arm (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - INSTALLATION).

(12) Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

STEERING GEAR INPUT SHAFT SEAL

REMOVAL

(1) Remove the steering gear from the vehicle (Refer to 19 - STEERING/GEAR - REMOVAL).

CAUTION: Do not overtighten the vise on the gear case. This may affect the adjustment

(2) Mount the steering gear upside down over a drain pan in a soft jawed vise.

(3) Place a drain pan under the gear and rotate the input shaft back and forth several times lock-to-lock to discharge the fluid from the steering gear

(4) Drain all the remaining fluid from the gear.

(5) Rotate the input shaft from stop to stop and count the number of turns using a 12 point socket (Fig. 9).

NOTE: The pitman shaft will not clear the housing if it is not centered.

(6) Center the input shaft by rotating it from the stop back 1 1/2 turns to achieve center position (Fig. 9).

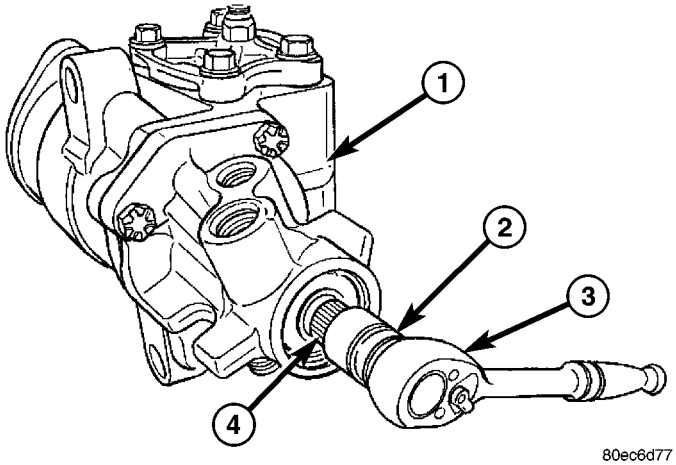

Fig. 9 CENTERING STEERING GEAR

1 - STEERING GEAR
2 - 12 POINT SOCKET
3 - RATCHET
4 - INPUT SHAFT

(7) Remove the pitman shaft (Refer to 19 - STEERING/GEAR/PITMAN SHAFT - REMOVAL).

(8) Remove the four bolts securing the valve housing.

(9) Remove the valve housing from the steering gear (Fig. 10).

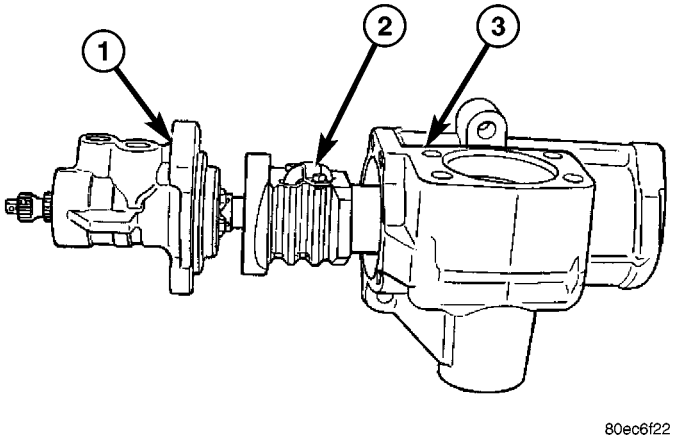

Fig. 10 VALVE ASSEMBLY

1 - VALVE HOUSING
2 - WORMSHAFT BALLS
3 - STEERING GEAR HOUSING

(10) Remove the valve housing and wormshaft assembly from the steering gear housing and place the valve housing in a soft jawed vise (Fig. 11).

STEERING GEAR INPUT SHAFT SEAL (Continued)

CAUTION: Use care not to score the housing bore when removing seals.

(15) Remove the snap ring with snap ring pliers (Fig. 16).

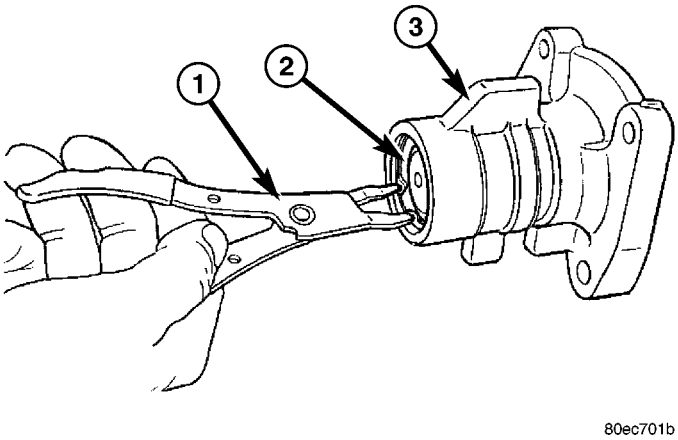

Fig. 16 SNAP RING REMOVAL

1 - SNAP RING PLIERS
2 - SNAP RING
3 - VALVE HOUSING

(16) Using special tool slide hammer C-3752 with adapter 8990 remove the oil seal (Fig. 17).

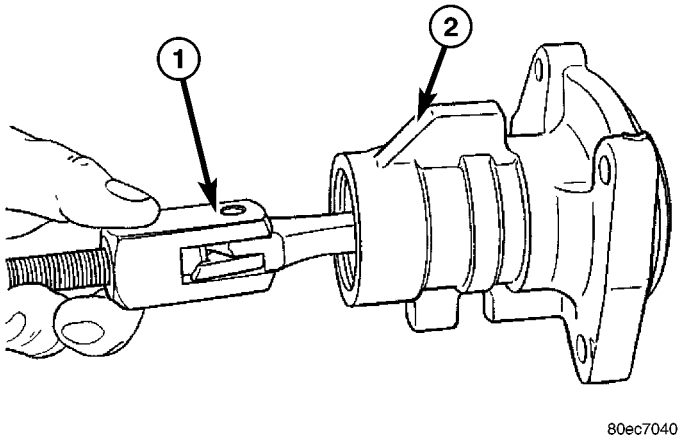

Fig. 17 OIL SEAL REMOVAL

1 - SPECIAL TOOL 8990 WITH SLIDE HAMMER C-3752
2 - VALVE HOUSING

INSTALLATION

(1) Inspect the piston teflon seals for damage. Replace if needed.

NOTE: To replace the teflon seals, use a pick to remove the teflon o-ring and the rubber o-ring underneath. Install a new rubber o-ring in the piston seal grove and a new teflon o-ring over the top of it.

(2) Install the valve into the valve housing.

(3) Thread the retainer ring into the valve housing (Fig. 18). Tighten to 97 N·m (72 ft. lbs.)

NOTE: It is very important to make sure to compensate for the added length of the torque wrench when torquing to proper specifications.

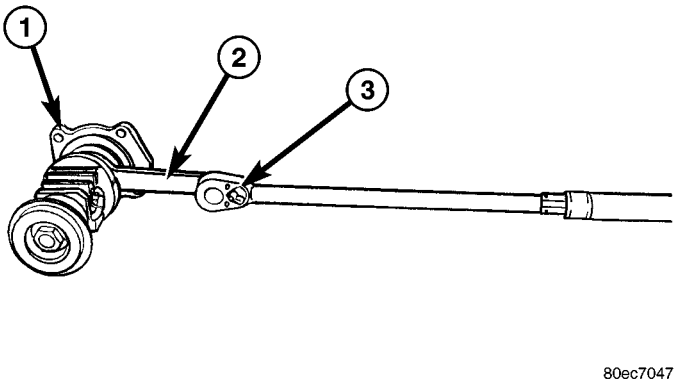

Fig. 18 RETAINER RING INSTALLATION

1 - VALVE HOUSING
2 - SPECIAL TOOL
3 - TORQUE WRENCH

(4) Install the retainer ring set screw. Tighten to 2.26 N·m (20 in. lbs.)

(5) Clean the steering gear housing.

CAUTION: Valve assembly must be centered to the housing (Fig. 19).

(6) Install the valve assembly into the steering gear (Fig. 19). Tighten the new bolts to 54 N·m (40 ft. lbs.)

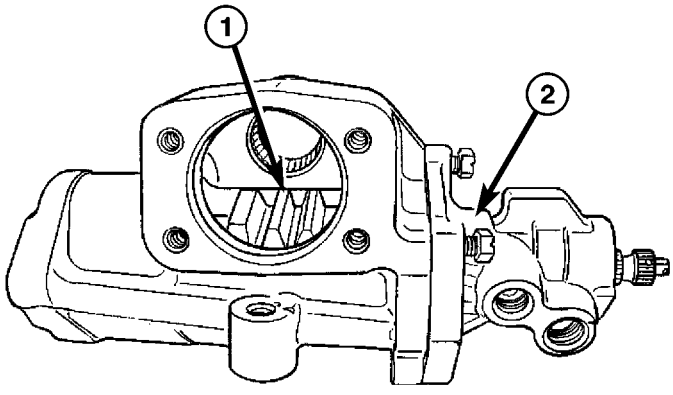

Fig. 19 CENTERED GEAR TEETH

STEERING GEAR INPUT SHAFT SEAL (Continued)

(7) Install the input shaft seal protector 8986 (Fig. 20).

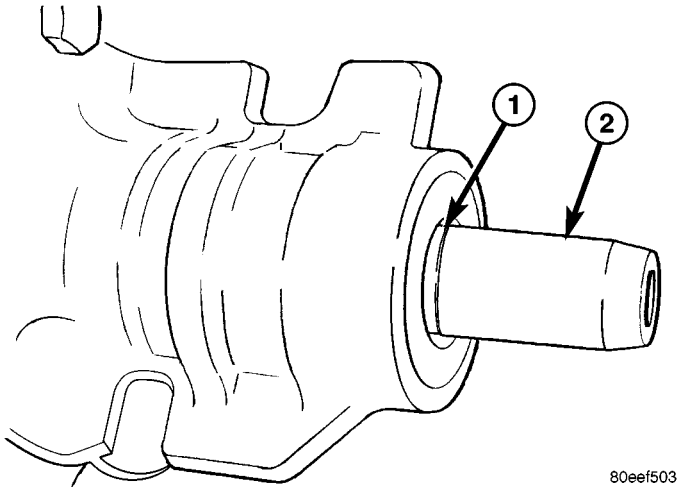

Fig. 20 INPUT SHAFT SEAL PROTECTOR

1 - INPUT SHAFT
2 - SPECIAL TOOL 8986

(8) Coat the new seal in **high temp grease** and Install the new oil seal using special tool 8987 driver and C-4171 handle (Fig. 21).

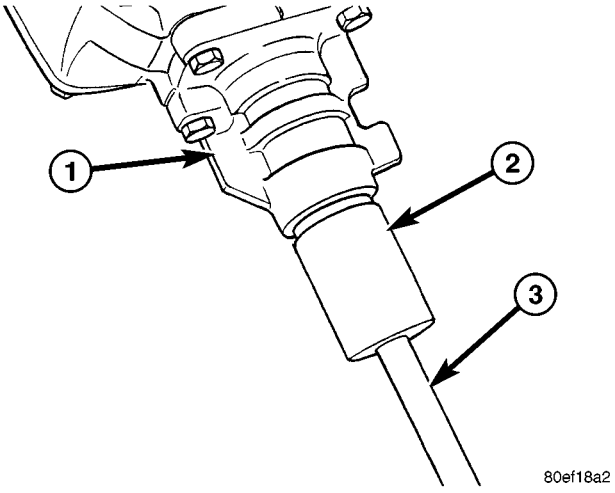

Fig. 21 INPUT SHAFT SEAL INSTALLATION

1 - VALVE HOUSING
2 - SPECIAL TOOL 8987
3 - SPECIAL TOOL C-4171

NOTE: Drive the oil seal into the housing until the outer edge does not quite clear the snap ring groove.

(9) Insert the snap ring into the housing. Using special tool 8987 driver and C-4171 handle push the snap ring and oil seal together until the snap ring seats in the groove.

NOTE: Generous amounts of the high temperature grease from the seal kit should be applied to areas between the pitman shaft bearing and oil seals and also between the dust seals and snap ring.

(10) Install the new dust seal using **high temp grease**, special tool C-4171 (driver) and 8987 (handle).

(11) Check to make sure the gear is centered in the middle tooth before installing the pitman shaft (Fig. 19).

(12) Install the pitman shaft into the steering gear (Refer to 19 - STEERING/GEAR/PITMAN SHAFT - INSTALLATION).

(13) Perform over-center meshload adjustment (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

(14) Install the steering gear to the vehicle (Refer to 19 - STEERING/GEAR - INSTALLATION).

(15) Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

PITMAN SHAFT

REMOVAL

REMOVAL - GAS

(1) Separate the pitman arm from the gear box (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL).

(2) Clean exposed end of pitman shaft and housing with a wire brush.

(3) Rotate the steering wheel from stop to stop and count the number of turns.

(4) Center the steering wheel by rotating it from the stop back 1 1/2 turns to achieve center position.

(5) Remove the pitman shaft cover bolts.

NOTE: The pitman shaft will not clear the housing if it is not centered.

(6) Remove the pitman shaft from the gear (Fig. 22).

(7) Remove the cover if needed by loosing the adjuster nut, Then removing the cover from the pitman shaft.

REMOVAL - DIESEL

(1) Separate the pitman arm from the gear box (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL).

(2) Remove the steering gear box (Refer to 19 - STEERING/GEAR - REMOVAL).

(3) Install the steering gear in a soft jawed bench vise.

PITMAN SHAFT (Continued)

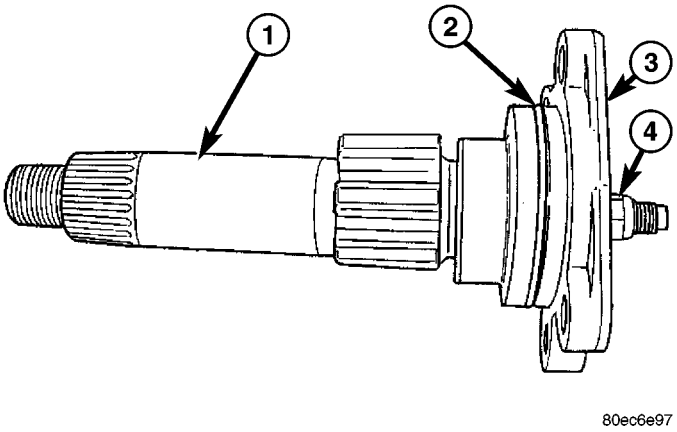

Fig. 22 PITMAN SHAFT

2 - O-RING SEAL
3 - COVER
4 - ADJUSTING NUT

(4) Clean exposed end of pitman shaft and housing with a wire brush.

(5) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns (Fig. 23).

(6) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns (Fig. 23).

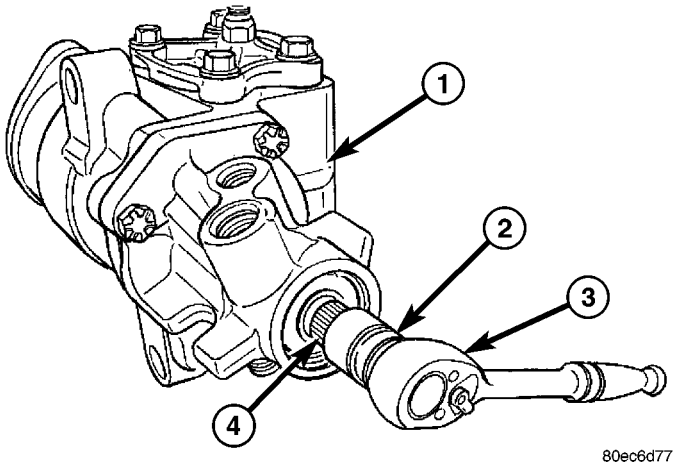

Fig. 23 CENTERING STEERING GEAR

1 - STEERING GEAR
2 - 12 POINT SOCKET
3 - RATCHET
4 - INPUT SHAFT

(7) Remove the pitman shaft cover bolts.

NOTE: The pitman shaft will not clear the housing if it is not centered.

(8) Remove the pitman shaft from the gear (Fig. 24).

(9) Remove the cover if needed by loosing the adjuster nut, Then removing the cover from the pitman shaft.

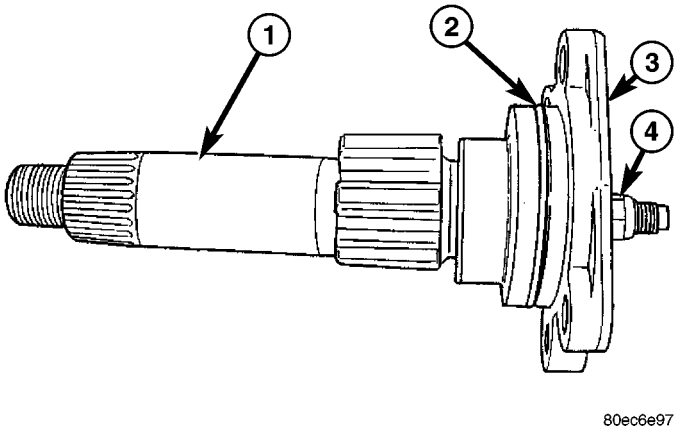

Fig. 24 PITMAN SHAFT

1 - PITMAN SHAFT
2 - O-RING SEAL
3 - COVER
4 - ADJUSTING NUT

INSTALLATION

INSTALLATION - GAS

(1) Coat the seal with **power steering fluid**.

(2) Install pitman shaft into the steering gear until it fully seats into the bearing.

(3) Install the new cover bolts and tighten to 68 N·m (50 ft. lbs.).

(4) Perform over-center meshload adjustment, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

(5) Install the pitman arm (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - INSTALLATION).

(6) Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

INSTALLATION - DIESEL

(1) Coat the seal with **power steering fluid**.

(2) Install the pitman shaft into the steering gear until it fully seats into the bearing.

(3) Install the new cover bolts and tighten to 68 N·m (50 ft. lbs.).

(4) Perform over-center meshload adjustment (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

(5) Install the steering gear (Refer to 19 - STEERING/GEAR - INSTALLATION).

(6) Install the pitman arm (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - INSTALLATION).

(7) Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

LINKAGE - INDEPENDENT FRONT SUSPENSION

DIAGNOSIS AND TESTING - OUTER TIE ROD END

NOTE: If the outer tie rod end is equipped with a lubrication fitting, grease the joint then road test the vehicle before performing test.

(1) Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
(2) Remove the front tires.
(3) Mount a dial indicator solidly to the vehicle steering knuckle and then zero the dial indicator.
(4) Position indicator plunger on the topside of the outer tie rod end.

NOTE: The dial indicator plunger must be perpendicular to the machined surface of the outer tie rod end.

(5) Position a pry bar in order to pry downwards on the outer tie rod end.
(6) If the travel exceeds 0.5 mm (0.020 in.), replace the outer tie rod end (Refer to 19 - STEERING/ LINKAGE/TIE ROD END - REMOVAL).
(7) If the outer tie rod end is within specs reinstall the front tires (Refer to 22 - TIRES/WHEELS/ WHEELS - STANDARD PROCEDURE).

TIE ROD END

REMOVAL - OUTER TIE ROD END

NOTE: Do not twist the boot anytime during removal or installation.

(1) Loosen the jam nut.
(2) Remove the outer tie rod end nut from the ball stud.
(3) Separate the tie rod ball stud from the knuckle with Remover 8677 (Fig. 1).
(4) Unthread the outer tie rod end from the inner tie rod.

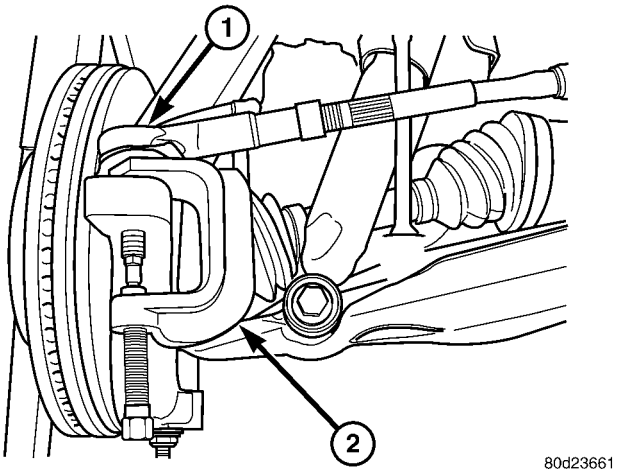

Fig. 1 TIE ROD SEPARATION

1 - TIE ROD END
2 - SPECIAL TOOL 8677

TIE ROD END (Continued)

INSTALLATION - OUTER TIE ROD END

NOTE: Do not twist the boot at anytime during removal or installation.

(1) Thread the outer tie rod end onto the inner tie rod, to it's original position (Fig. 2).

(2) Install the outer tie rod end into the steering knuckle (Fig. 2).

(3) Tighten the ball stud nut on the ball stud to 61 N·m (45 ft. lbs.) then an additional 90°.

(4) Set wheel toe pattern, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

(5) Tighten jam nut to 75 N·m (55 ft. lbs.) (Fig. 2).

DESCRIPTION

The steering linkage is comprised of a tie rod end, tie rod, drag link, steering damper and pitman arm (Fig. 1).

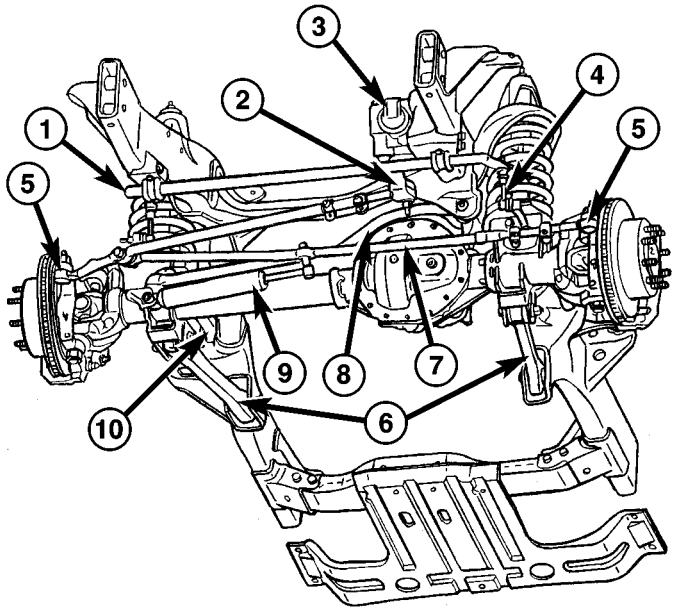

Fig. 1 LINK/COIL FRONT SUSPENSION

1 - STABILIZER BAR
2 - PITMAN ARM
3 - STEERING GEAR
4 - STABILIZER LINK
5 - TIE ROD ENDS
6 - LOWER SUSPENSION ARMS
7 - DRAG LINK
8 - TRACK BAR
9 - DAMPER
10 - UPPER SUSPENSION ARM

CAUTION: If any steering components are replaced or serviced an alignment must be performed.

NOTE: To avoid damaging ball stud seals, use Puller C-3894–A or an appropriate puller to remove tie rod ends (Fig. 2).

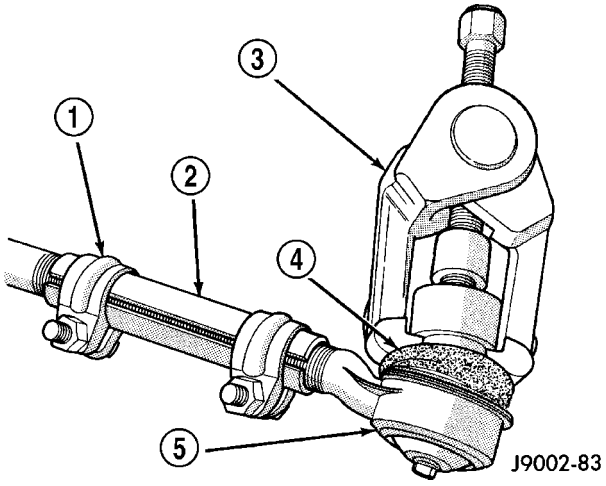

Fig. 2 Ball Stud Puller

STANDARD PROCEDURE - LUBRICATION

Periodic lubrication of the steering system components is required. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

The following components must be lubricated:

- Tie rod
- Tie rod end
- Drag link

LINKAGE - LINK/COIL (Continued)

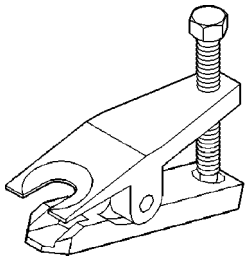
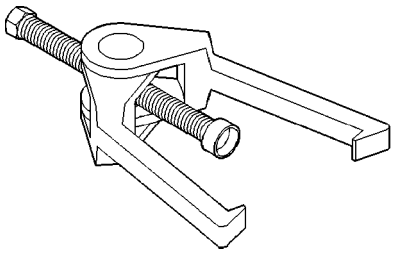
SPECIAL TOOLS

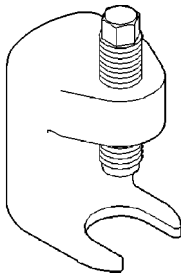
STEERING LINKAGE



Remover Ball Stud MB-991113



Puller Tie Rod C-3894-A



Remover Ball Joint C-4150A

DAMPER

REMOVAL

(1) Remove the steering damper mounting nuts and bolts.
(2) Slide the damper from the isolation bushing.
(3) Remove the damper.

INSTALLATION

(1) Install the steering damper on the axle and isolation bushing. Tighten nut to 95 N·m (75 ft. lbs.).
(2) Install the steering damper on the tie rod. Tighten nut to 81 N·m (60 ft. lbs.).

DRAG LINK

REMOVAL

(1) Remove the draglink nut from the pitman arm side.
(2) Remove the drag link nut from the knuckle side.
(3) Remove the drag link from the right knuckle and pitman arm with Puller C-3894A (Fig. 3).

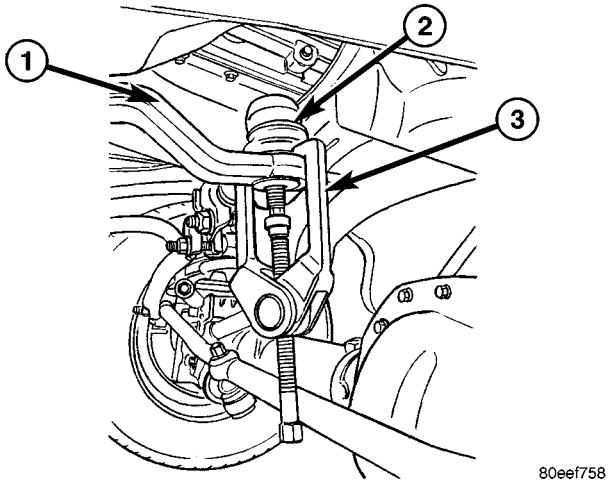


Fig. 3 DRAGLINK REMOVAL

1 - PITMAN ARM
2 - DRAGLINK
3 - C -3894-A PULLER

INSTALLATION

(1) Install the drag link to the pitman arm. Install the nut and tighten to 88 N·m (65 ft. lbs.).
(2) Install the drag link to the right steering knuckle. Install the nut and tighten to 108 N·m (80 ft. lbs.).
(3) Install tie rod to the left steering knuckle and drag link. Install the nuts and tighten to 108 N·m (80 ft. lbs.).
(4) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
(5) After adjustment tighten tie rod adjustment sleeve clamp bolts to 61 N·m (45 ft. lbs.).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

PITMAN ARM

REMOVAL

(1) Remove the drag link from the right knuckle and pitman arm with Puller C-4150A (Fig. 4).

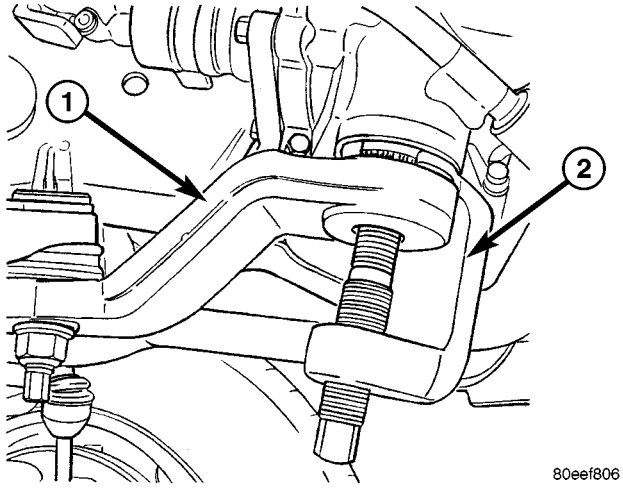

Fig. 4 PITMAN ARM REMOVAL

1 - PITMAN ARM
2 - C-4150A PULLER

PITMAN ARM (Continued)

(2) Mark the pitman arm and shaft positions for installation reference. Remove the nut and washer from the pitman arm (Fig. 5). Remove the pitman arm with Puller C-4150A.

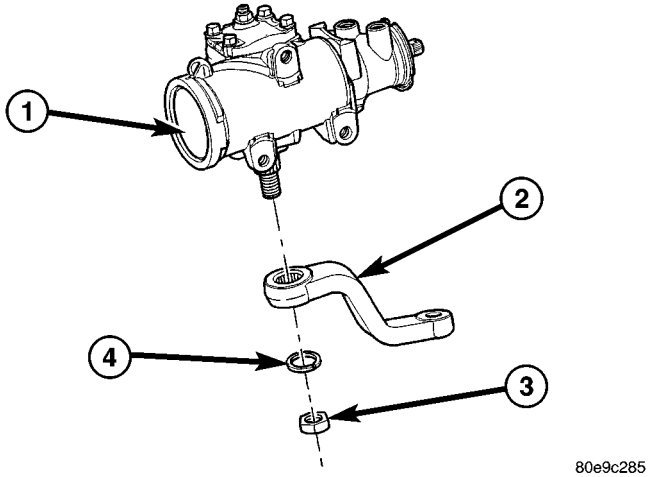

Fig. 5 PITMAN ARM REMOVAL/INSTALLATION

1 - STEERING GEAR
2 - PITMAN ARM
3 - NUT
4 - WASHER

INSTALLATION

(1) Align reference marks and install pitman arm.

(2) Install the lock washer and retaining nut on the pitman shaft and tighten nut to 251 N·m (185 ft. lbs.).

(3) Install the drag link to the pitman arm (Fig. 6). Install the nut and tighten to 108 N·m (80 ft. lbs.).

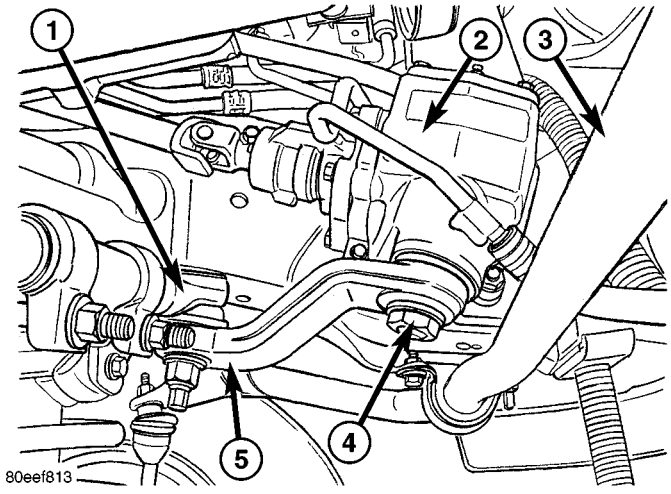

Fig. 6 PITMAN ARM INSTALLED

1 - DRAGLINK
2 - STEERING GEAR
3 - SWAYBAR
4 - NUT/WASHER
5 - PITMAN ARM

(4) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

(5) After adjustment tighten tie rod adjustment sleeve clamp bolts to 61 N·m (45 ft. lbs.).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

TIE ROD END

REMOVAL

(1) Remove tie rod nuts (Fig. 7).

(2) Remove tie rod from drag link and left knuckle with Puller C-4150A.

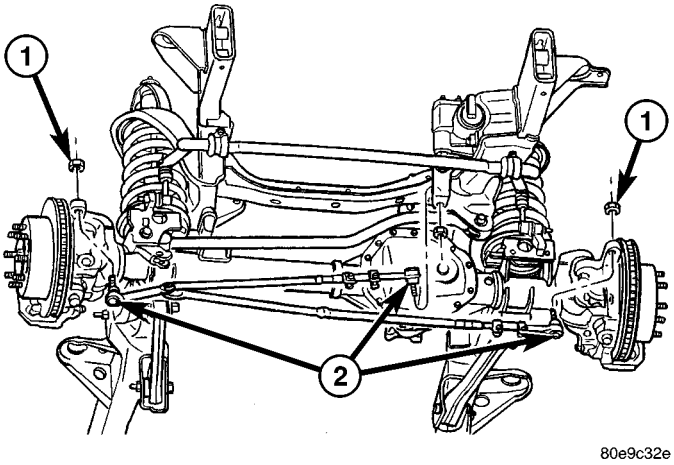

Fig. 7 TIE ROD ENDS

1 - NUT
2 - TIE ROD ENDS

INSTALLATION

(1) Install tie rod to the left steering knuckle and drag link. Install the nuts and tighten to 108 N·m (80 ft. lbs.).

(2) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

(3) After adjustment tighten tie rod adjustment sleeve clamp bolts to 61 N·m (45 ft. lbs.).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

TRACK BAR

REMOVAL

(1) Raise and support the axle.
(2) Remove the track bar bolts and nuts (Fig. 8).
(3) Remove the track bar (Fig. 8).

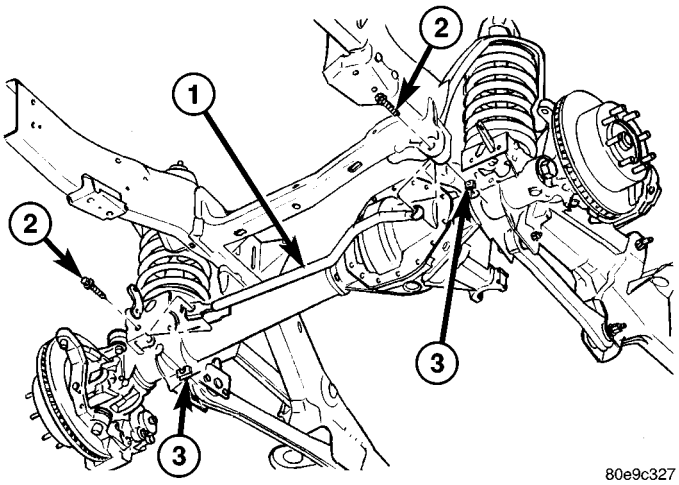

Fig. 8 TRACK BAR REMOVAL/INSTALLATION

1 - TRACK BAR
2 - BOLT
3 - NUT

INSTALLATION

(1) Install the track bar.
(2) Install the new bolts and nuts. Tighten to 203 N·m (150 ft lbs.).
(3) Remove the supports under the axle and lower the vehicle to the ground.

PUMP

DESCRIPTION

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The pump is connected to the steering gear via the pressure hose and the return hose. The pump shaft has a pressed-on pulley that is belt driven by the crankshaft pulley.

All vehicles are equipped with a power steering fluid cooler.

NOTE: Power steering pumps are not interchangeable with pumps installed on other vehicles.

PUMP (Continued)

OPERATION

Hydraulic pressure is provided for the power steering gear by the belt driven power steering pump (Fig. 1). The power steering pumps are constant flow rate and displacement, vane-type pumps.

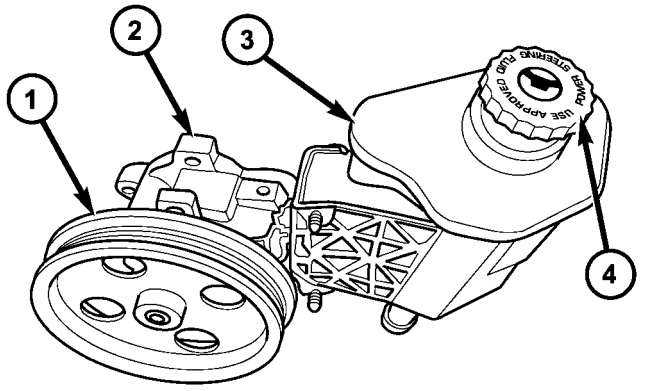

Fig. 1 POWER STEERING PUMP

1 - 3.7L & 4.7L (6 GROOVE)

PHENOLIC (PLASTIC TYPE) PULLEY
1 - 5.9L DIESEL (8 GROOVE)
STEEL PULLEY
2 - PUMP ASSEMBLY
3 - RESERVOIR
4 - CAP

DIAGNOSIS AND TESTING - PUMP LEAKAGE

The pump is serviced as an assembly and should not be disassembled. The plastic pump reservoir and the reservoir o-rings can be replaced.

Check for leaks in the following areas:

- Pump shaft seal behind the pulley
- Pump to reservoir O-ring
- Reservoir cap
- Pressure and return lines
- Flow control valve fitting

STANDARD PROCEDURE

STANDARD PROCEDURE - POWER STEERING PUMP - INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal temperature.

(1) Turn steering wheel all the way to the left

(2) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.

(3) Raise the front wheels off the ground.

(4) Slowly turn the steering wheel lock-to-lock 20 times with the engine off while checking the fluid level.

NOTE: For vehicles with long return lines or oil coolers turn wheel 40 times.

(5) Start the engine. With the engine idling maintain the fluid level.

(6) Lower the front wheels and let the engine idle for two minutes.

(7) Turn the steering wheel in both direction and verify power assist and quiet operation of the pump.

If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

STANDARD PROCEDURE - FLUSHING POWER STEERING SYSTEM

Flushing is required when the power steering/hydraulic booster system fluid has become contaminated. Contaminated fluid in the steering/booster system can cause seal deterioration and affect steering gear/booster spool valve operation.

(1) Raise the front end of the vehicle off the ground until the wheels are free to turn.

(2) Remove the return line from the pump.

NOTE: If vehicle is equipped with a hydraulic booster remove both return lines from the pump.

(3) Plug the return line port/ports at the pump.

(4) Position the return line/lines into a large container to catch the fluid.

(5) While an assistant is filling the pump reservoir start the engine.

(6) With the engine running at idle turn the wheel back and forth.

NOTE: Do not contact or hold the wheel against the steering stops.

(7) Run a quart of fluid through the system then stop the engine and install the return line/lines.

PUMP (Continued)

(8) Fill the system with fluid and perform Steering Pump Initial Operation, (Refer to 19 - STEERING/ PUMP - STANDARD PROCEDURE).

(9) Start the engine and run it for fifteen minutes then stop the engine.

(10) Remove the return line/lines from the pump and plug the pump port/ports.

(11) Pour fresh fluid into the reservoir and check the draining fluid for contamination. If the fluid is still contaminated, then flush the system again.

(12) Install the return line/lines and perform Steering Pump Initial Operation, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

REMOVAL

REMOVAL - GAS

(1) Drain and siphon the power steering fluid from the reservoir.

(2) Remove the serpentine belt.

CAUTION: Do not remove the fitting on the pump that the high pressure hose screws into. The fitting may come loose unless it is backed up using another wrench. If the fitting does come loose, it must be retightened before continuing. (57 - 67Nm, 40 - 50 lbft) If this fitting comes out of the pump body, the internal spring and valve parts will fall out of the pump and they cannot be reinstalled properly. If this occurs the pump needs to be replaced with a new pump.

(3) Disconnect the return hose. (Fig. 2)

(4) Disconnect the pressure hose. (Fig. 2)

(5) Access to remove the three bolts securing the pump to the cylinder head can be gained thru the pulley holes. (Fig. 2)

REMOVAL - DIESEL

(1) Drain and siphon the power steering fluid from the reservoir.

(2) Remove the serpentine belt.

CAUTION: Do not remove the fitting on the pump that the high pressure hose screws into. The fitting may come loose unless it is backed up using another wrench. If the fitting does come loose, it must be retightened before continuing. (57 - 67Nm, 40 - 50 lbft) If this fitting comes out of the pump body, the internal spring and valve parts will fall out of the pump and they cannot be reinstalled properly. If this occurs the pump needs to be replaced with a new pump.

(3) Disconnect the return hose.

(4) Disconnect the pressure hose.

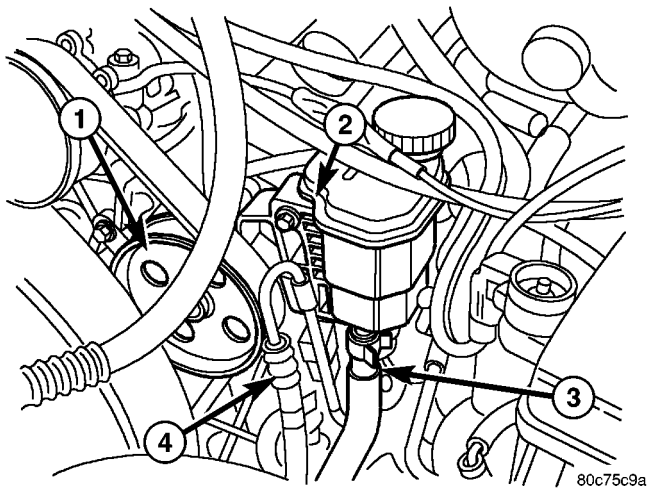

Fig. 2 POWER STEERING PUMP

1 - POWER STEERING PULLEY
2 - POWER STEERING RESERVOIR
3 - RETURN HOSE
4 - HIGH PRESSURE HOSE

(5) Access to remove the three bolts securing the pump to the cylinder head can be gained thru the pulley holes.

(6) Loosen the pump bracket to the block.

(7) Remove the 6 intake plenum bolts (Fig. 3).

(8) loosen the inner cooler tube clamp at the intake plenum and remove the intake plenum.

(9) Loosen the inner cooler tube clamp at the radiator support side and remove the tube from the vehicle.

(10) Remove the power steering pump from the top of the engine compartment where the intake plenum was (Fig. 3).

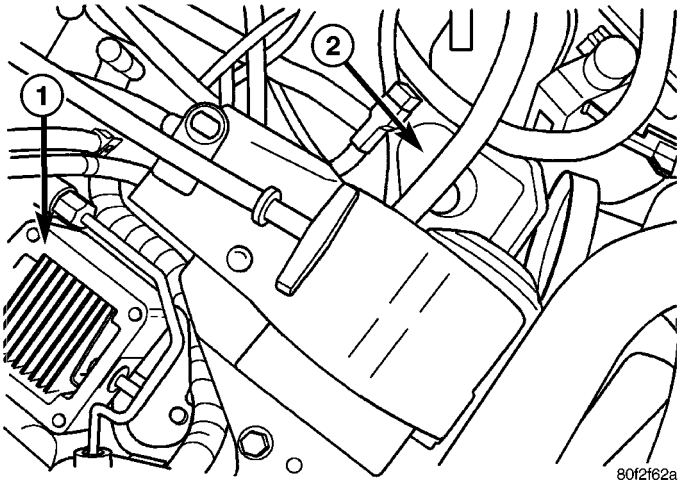

Fig. 3 POWER STEERING PUMP ACCESS

1 - INTAKE PLENUM MOUNTING
2 - POWER STEERING PUMP

PUMP (Continued)

INSTALLATION

INSTALLATION - GAS

(1) Align the pump with the mounting holes in the left cylinder head.

(2) Install 3 pump mounting bolts through the pulley access holes. Tighten the bolts to 28 N·m (21 ft. lbs.).

(3) Reconnect the pressure line and return hose to the pump and reservoir. Tighten the pressure line to 37 N·m (27 ft. lbs.).

(4) Install the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(5) Fill the power steering pump, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - DIESEL

(1) Set the power steering pump in place in the engine compartment from the top (Fig. 3).

(2) Install the inner cooler tube.

(3) Tighten the inner cooler tube clamp at the radiator support side.

(4) Install the 6 intake plenum bolts (Fig. 3).

(5) Tighten the inner cooler tube clamp at the intake plenum.

(6) Install 3 pump mounting bolts through the pulley access holes. Tighten the bolts to 28 N·m (21 ft. lbs.).

(7) Tighten the pump bracket to the block.

(8) Reconnect the pressure line and return hose to the pump and reservoir. Tighten the pressure line to 37 N·m (27 ft. lbs.).

(9) Install the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(10) Fill the power steering pump, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

FLUID

DESCRIPTION

The recommended fluid for the power steering system is Mopar® ATF +4.

Mopar® ATF+4, when new is red in color. The ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition, As the vehicle is driven, the ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two ranges listed on the dipstick, COLD and HOT. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum area of the cold range. When the fluid is hot, fluid level is allowed to read up to the highest end of the HOT range. Only add fluid when the vehicle is cold.

Use only Mopar® ATF+4 Do not overfill the power steering system.

FLUID COOLER

REMOVAL

(1) Drain and siphon the power steering fluid.

(2) Disconnect the return and supply hoses connected to the power steering fluid cooler.

(3) Remove the mounting bracket bolts securing the fluid cooler to the brace. (Fig. 4)& (Fig. 5)

(4) Remove the fluid cooler from the vehicle.

4 - P/S FLUID COOLER

INSTALLATION

(1) Install the fluid cooler to the vehicle.

(2) Install the mounting bracket bolts securing the fluid cooler to the brace (Fig. 4)& (Fig. 5).

(3) Reclamp the return and supply hoses to the power steering fluid cooler.

(4) Refill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

HOSES - I.F.S.

REMOVAL

REMOVAL - RETURN HOSE - GEAR TO COOLER

(1) Drain and siphon the power steering system.
(2) Raise and support the vehicle.
(3) Disconnect the return hose at the cooler.
(4) Disconnect the return hose at the gear (Fig. 6).
(5) Remove the return hose from the routing clamp at the fan shroud and then remove from the vehicle.

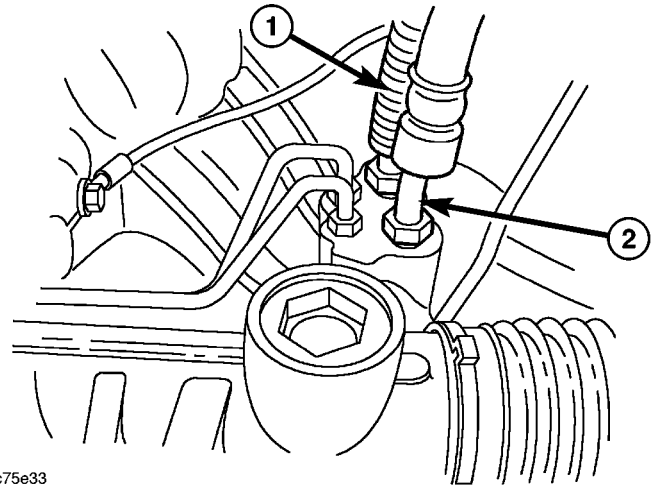

Fig. 6 HOSE CONNECTIONS

1 - RETURN HOSE
2 - PRESSURE HOSE

REMOVAL - PRESSURE HOSE

(1) Drain and siphon the power steering system.
(2) Raise and support the vehicle.
(3) Disconnect the pressure hose at the pump.
(4) Disconnect the pressure hose at the gear (Fig. 6).
(5) Remove the pressure hose from the vehicle.

REMOVAL - RETURN HOSE - RESERVOIR TO COOLER

(1) Drain and siphon the power steering system.
(2) Disconnect the return hose at the reservoir.
(3) Raise and support the vehicle.
(4) Remove the return hose from the routing clamp at the fan shroud.
(5) Disconnect the return hose at the cooler.
(6) Remove the hose from the vehicle.

INSTALLATION

INSTALLATION - RETURN HOSE - GEAR TO COOLER

(1) Install the return hose to the vehicle.
(2) Reconnect the return hose at the cooler.
(3) Reconnect the return hose at the gear. Tighten the hose to 71 N·m (52 ft. lbs.) (Fig. 6).
(4) Reattach the hose to the routing clip at the fan shroud.
(5) Remove the support and lower the vehicle.
(6) Refill the power steering system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - PRESSURE HOSE

NOTE: Be sure to align the pressure hose so it does not contact the fan shroud or the frame rail.

(1) Install the pressure hose to the vehicle.
(2) Reconnect the pressure hose at the gear. Tighten the hose to 32 N·m (23 ft. lbs.) (Fig. 6).
(3) Reconnect the pressure hose at the pump. Tighten the hose to 36 N·m (27 ft. lbs.).
(4) Remove the support and lower the vehicle.
(5) Refill the power steering system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - RETURN HOSE - RESERVOIR TO COOLER

(1) Install the return hose to the vehicle.
(2) Reconnect the return hose at the cooler.
(3) Reattach the hose to the routing clip at the fan shroud.
(4) Remove the support and lower the vehicle.
(5) Reconnect the return hose at the reservoir.
(6) Refill the power steering system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

HOSES - LINK/COIL

REMOVAL

REMOVAL - RETURN HOSE - GEAR TO COOLER

(1) Drain and siphon the power steering system.
(2) Raise and support the vehicle.
(3) Disconnect the return hose at the cooler.
(4) Disconnect the return hose at the gear (Fig. 7).
(5) Remove the return hose from the routing clamp at the fan shroud and then remove from the vehicle.

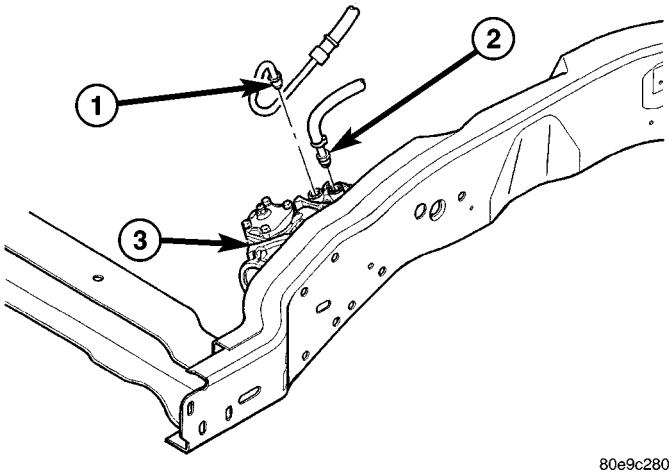

Fig. 7 POWER STEERING HOSES TO STEERING GEAR

1 - HIGH PRESSURE HOSE

3 - STEERING GEAR

REMOVAL - PRESSURE HOSE

(1) Drain and siphon the power steering system.
(2) Raise and support the vehicle.
(3) Disconnect the pressure hose at the pump.
(4) Disconnect the pressure hose at the gear (Fig. 8).
(5) Remove the pressure hose from the vehicle.

REMOVAL - RETURN HOSE - RESERVOIR TO COOLER

(1) Drain and siphon the power steering system.
(2) Disconnect the return hose at the reservoir.
(3) Raise and support the vehicle.
(4) Remove the return hose from the routing clamp at the fan shroud.
(5) Disconnect the return hose at the cooler.
(6) Remove the hose from the vehicle.

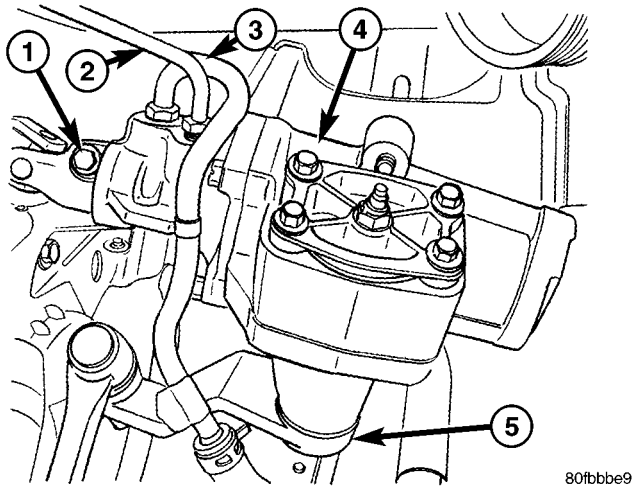

Fig. 8 HOSES INSTALLED

1 - LOWER COUPLING BOLT
2 - HIGH PRESSURE HOSE
3 - RETURN HOSE
4 - STEERING GEAR
5 - PITMAN ARM

INSTALLATION

INSTALLATION - RETURN HOSE - GEAR TO COOLER

(1) Install the return hose to the vehicle.
(2) Reconnect the return hose at the cooler.
(3) Reconnect the return hose at the gear. Tighten the hose to 51 N·m (38 ft. lbs.) (Fig. 7).
(4) Reattach the hose to the routing clip at the fan shroud.
(5) Remove the support and lower the vehicle.
(6) Refill the power steering system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - PRESSURE HOSE

NOTE: Be sure to align the pressure hose so it does not contact the fan shroud or the frame rail.

(1) Install the pressure hose to the vehicle.
(2) Reconnect the pressure hose at the gear. Tighten the hose to 32 N·m (23 ft. lbs.) (Fig. 8).
(3) Reconnect the pressure hose at the pump. Tighten the hose to 36 N·m (27 ft. lbs.).
(4) Remove the support and lower the vehicle.
(5) Refill the power steering system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - RETURN HOSE - RESERVOIR TO COOLER

(1) Install the return hose to the vehicle.
(2) Reconnect the return hose at the cooler.
(3) Reattach the hose to the routing clip at the fan shroud.

HOSES - LINK/COIL (Continued)

(4) Remove the support and lower the vehicle.
(5) Reconnect the return hose at the reservoir.
(6) Refill the power steering system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

POWER STEERING PRESSURE SWITCH

DESCRIPTION

A pressure sensing switch is used in the power steering system. It is mounted on the high-pressure steering hose (Fig. 9). This switch will be used with both 3.7L and 5.7L engines. There is no pressure switch used for the 4.7L or the 5.9L pump.

OPERATION

The switch is used on the 3.7L V-6 & 5.7L V-8 engines.

The power steering pressure switch provides an input to the Powertrain Control Module (PCM). This input is provided during periods of high steering pump load and low engine rpm; such as during parking maneuvers. The PCM increases the idle speed through the Idle Air Control (IAC) motor. This is done to prevent the engine from stalling under the increased load.

When steering pump pressure exceeds 3275 kPa ± 690 kPa (475 psi ± 100 psi), the Normally Closed (NC) switch will open and the PCM will increase the engine idle speed. This will prevent the engine from stalling.

When pump pressure drops to approximately 1379 kPa (200 psi), the switch circuit will re-close and engine idle speed will return to its previous setting.

REMOVAL - 3.7L & 5.7L

The power steering pressure switch is installed in the power steering high-pressure hose (Fig. 9).

(1) Disconnect electrical connector from power steering pressure switch.
(2) Place a small container or shop towel beneath switch to collect any excess fluid.
(3) Remove switch. Use back-up wrench on power steering line to prevent line bending.

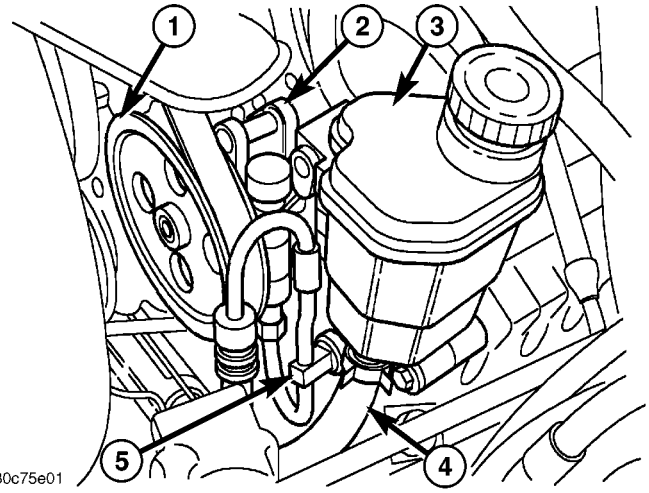

Fig. 9 PRESSURE SWITCH

1 - POWER STEERING PULLEY
2 - POWER STEERING PUMP HOUSING
3 - POWER STEERING FLUID RESERVOIR
4 - RETURN HOSE
5 - HIGH PRESSURE HOSE WITH PRESSURE SWITCH

INSTALLATION - 3.7L & 5.7L

This switch is used only with the 3.7L V–6 and the 5.7L V-8 engines.

(1) Install power steering switch into power steering line.
(2) Tighten to 8–11 N·m (70–100 in. lbs.) torque.
(3) Connect electrical connector to switch.
(4) Check power steering fluid and add as necessary.
(5) Start engine and again check power steering fluid. Add fluid if necessary.

PULLEY

REMOVAL

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

(1) Remove the power steering pump assembly, (Refer to 19 - STEERING/PUMP - REMOVAL).
(2) Remove the pulley from the pump using (OTC® 7185) power steering pulley removal tool or equivalent (Fig. 10).

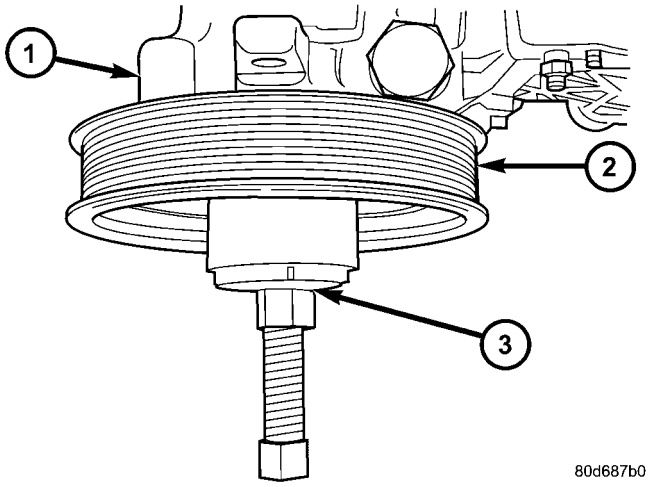

Fig. 10 PULLEY REMOVAL

1 - POWER STEERING PUMP
2 - PULLEY
3 - POWER STEERING PULLEY REMOVAL TOOL

INSTALLATION

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

(1) Replace the pulley if it's bent, cracked, or loose.
(2) Install the pulley on the pump using (OTC® 7771) power steering pulley installation tool or equivalent (Fig. 11) making sure it is flush with the end of the shaft. Ensure the tool and pulley remain aligned with the pump shaft.
(3) Install the power steering pump assembly, (Refer to 19 - STEERING/PUMP - INSTALLATION).
(4) Run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

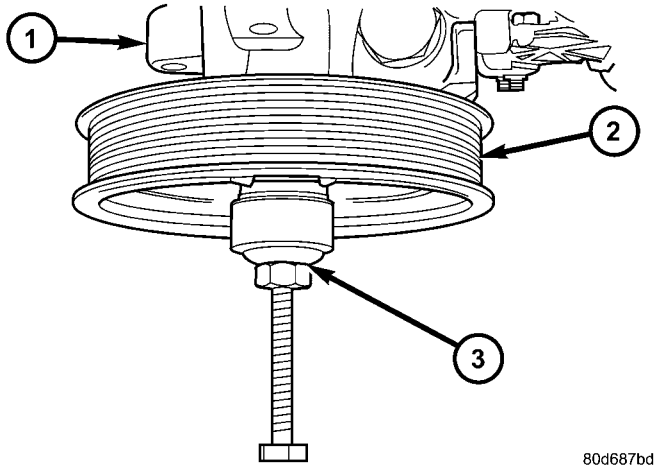

Fig. 11 PULLEY INSTALLATION

1 - POWER STEERING PUMP
2 - PULLEY
3 - POWER STEERING PUMP PULLEY INSTALLATION TOOL

RESERVOIR

REMOVAL

(1) Drain and siphon the power steering fluid from the reservoir.
(2) Remove the serpentine belt.
(3) Remove the power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).
(4) Remove the reservoir mounting bolts.
(5) Remove the reservoir.
(6) Remove the rear bracket to the pump mounting bolts.

INSTALLATION

(1) Install the reservoir bracket to the pump housing. **Do not reuse the o-rings (install new o-rings).** Tighten bolts to 7 N·m (62 in. lbs.).

NOTE: Ensure the reservoir is fully seated onto the pump.

(2) Install the reservoir to the bracket/pump body.
(3) Install the reservoir mounting bolts. Tighten bolts to 13 N·m (120 in. lbs.).
(4) Install the power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).
(5) Install the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(6) Fill the power steering pump, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

MANUAL TRANSMISSION - NV3500

DESCRIPTION

The transmission is a medium-duty 5-speed, constant mesh fully synchronized manual transmission with fifth gear overdrive range. The transmission is available in two and four-wheel drive configurations. The transmission gear case consists of two aluminum housings (Fig. 1). The clutch housing is an integral part of the transmission front housing.

A combination of roller and ball bearings are used to support the transmission shafts in the two housings. The transmission gears all rotate on caged type needle bearings. A roller bearing is used between the input and output shaft.

The transmission has a single shaft shift mechanism with three shift forks all mounted on the shaft. The shaft is supported in the front and rear housings by bushings and one linear ball bearing. Internal shift components consist of the forks, shaft, shift lever socket and detent components

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point, all the transmission gears are spinning.

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

Fig. 1 NV3500 TRANSMISSION

MANUAL TRANSMISSION - NV3500 (Continued)

DIAGNOSIS AND TESTING

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check. Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer.

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Shift component damage or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

REMOVAL

(1) Disconnect battery negative cable.
(2) Shift transmission into Neutral.
(3) Remove shift boot bezel screws and slide boot upward on shift lever extension.
(4) Remove shift lever extension from the shift tower and lever assembly.
(5) Raise vehicle on hoist.
(6) Remove skid plate, if equipped.
(7) Drain lubricant if transmission will be disassembled for service.
(8) Mark propeller shaft/shafts and companion flange yoke/yokes for installation reference and remove propeller shaft/shafts.
(9) Disconnect harness from clips on transmission housing.
(10) Remove transfer case linkage if equipped.
(11) Remove transfer case mounting nuts and remove transfer case if equipped.
(12) Remove slave cylinder mounting nut and remove cylinder (Fig. 2).

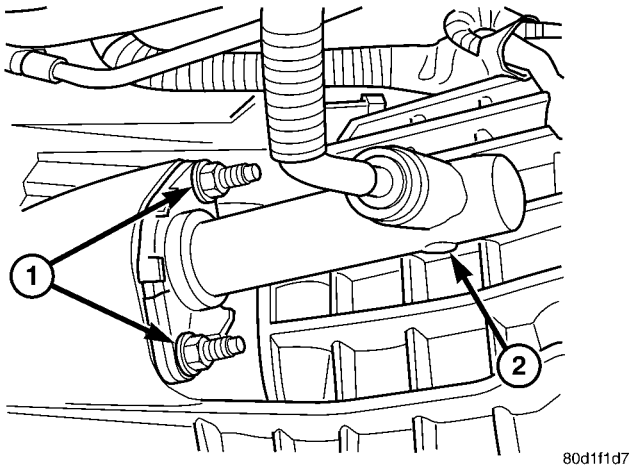

Fig. 2 SLAVE CYLINDER

1 - MOUNTING NUTS
2 - SLAVE CYLINDER

(13) Remove starter motor, structural dust cover bolts to clutch housing, dust shield bolt and suspension crossmember (Fig. 3).

CAUTION: Do not remove structural dust cover from enigne block. If cover is removed clutch housing and cover must be aligned with the engine.

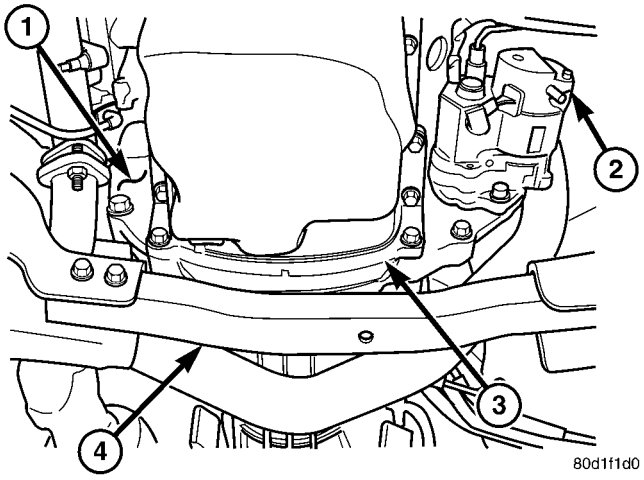

Fig. 3 DUST COVER

1 - DUST SHIELD
2 - STARTER MOTOR
3 - DUST COVER
4 - CROSSMEMBER

(14) Remove exhaust pipe from the exhaust manifolds.

(15) Support engine with adjustable jack stand and wood block.

(16) Support and secure transmission to a transmission jack with safety chains.

(17) Remove bolts from the rear transmission mount.

(18) Remove the rear crossmember and transmission mount (Fig. 4).

(19) Remove bolts attaching transmission to the engine.

(20) Move transmission rearward until input shaft is clear of clutch disc and pressure plate. Then lower jack and remove transmission from under vehicle.

DISASSEMBLY

FRONT HOUSING

(1) Shift transmission into Neutral.

(2) If lubricant was not drained out of transmission during removal, remove drain plug and drain lubricant.

(3) Inspect drain plug magnet for debris.

(4) Remove backup light switch located on passenger side of rear housing (Fig. 5).

(5) Remove shift tower bolts and remove tower and lever assembly (Fig. 6).

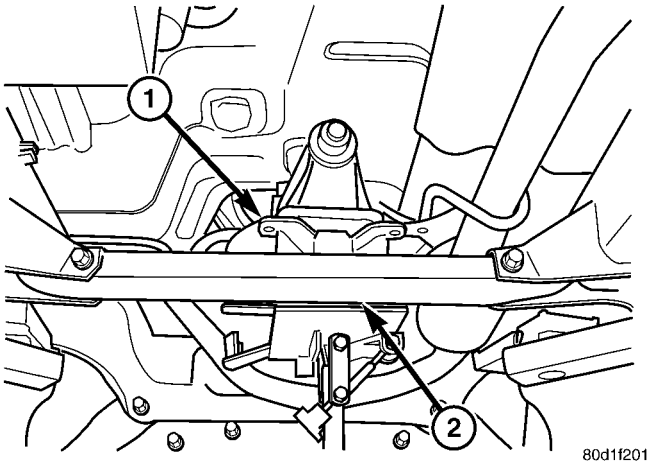

Fig. 4 CROSSMEMBER

1 - TRANSMISSION MOUNT
2 - CROSSMEMBER

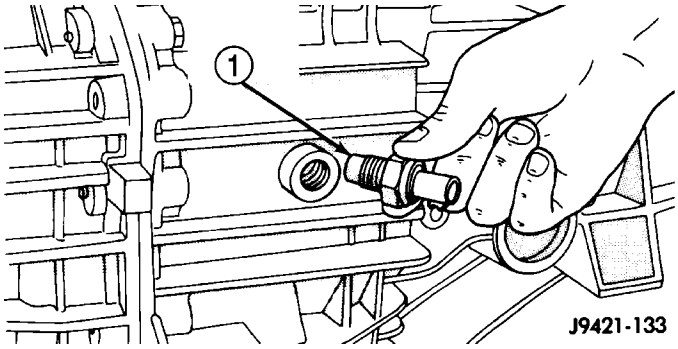

Fig. 5 BACKUP LIGHT SWITCH

1 - BACKUP LIGHT SWITCH

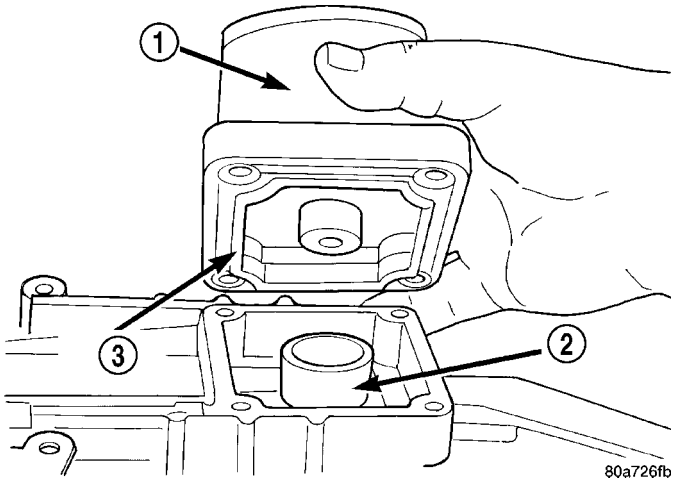

Fig. 6 SHIFT TOWER

1 - SHIFT TOWER
2 - SHIFT SOCKET
3 - SEAL

MANUAL TRANSMISSION - NV3500 (Continued)

(6) Remove shift shaft lock bolt (Fig. 7) from the top of front housing. The bolt secures the shift shaft bushing and lever.

NOTE: This is a special bolt and can not be substituted with any other bolt.

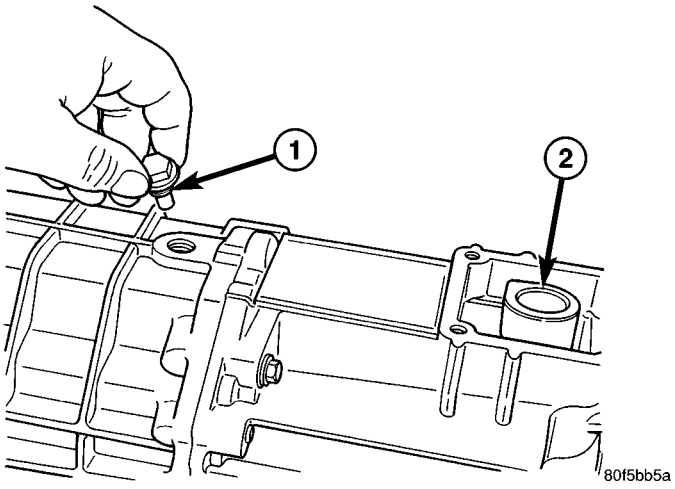

Fig. 7 SHAFT LOCK BOLT

1 - SHIFT SHAFT LOCK BOLT
2 - SHAFT SOCKET

(7) Remove input shaft bearing retainer bolts from the front housing, then carefully pry on the retainer to break sealer bead loose (Fig. 8).

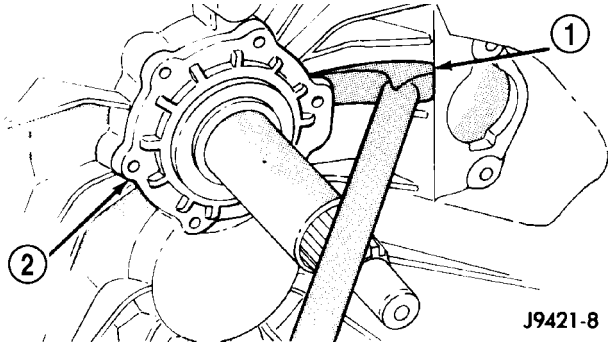

Fig. 8 BEARING RETAINER SEAL

1 - PRY TOOL
2 - INPUT SHAFT BEARING RETAINER

(8) Remove bearing retainer from input shaft (Fig. 9).

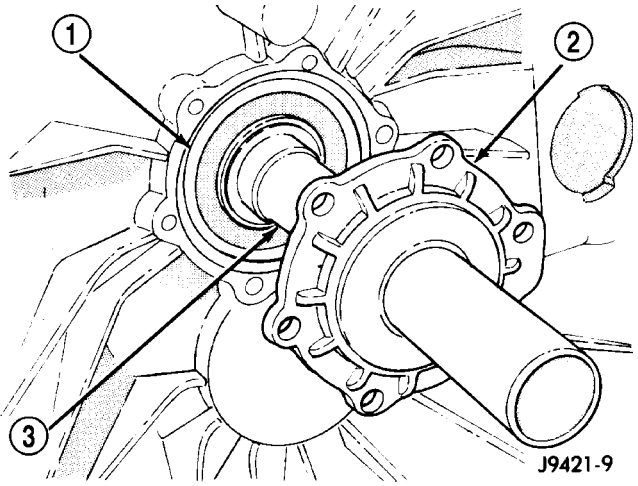

Fig. 9 INPUT SHAFT BEARING RETAINER

1 - SHAFT BEARING
2 - BEARING RETAINER
3 - INPUT SHAFT

(9) Remove input shaft snap ring (Fig. 10).

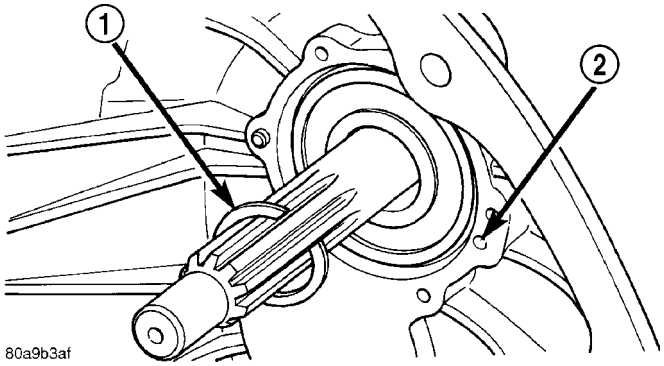

Fig. 10 INPUT SHAFT SNAP RING

1 - INPUT SHAFT SNAP RING
2 - OIL FEED

(10) Remove shift shaft detent plug from the side of the transmission with Remover 8117A. Attach fingers of the remover to the detent plug and push the cup down till it contacts the trans. Then tighten the nut till it pulls the plug from the case.

(11) Remove shift shaft detent plunger and spring with a pencil magnet.

MANUAL TRANSMISSION - NV3500 (Continued)

(12) Remove bolts that attach front housing to the rear housing (Fig. 11). Three bolts at extreme rear of housing are for the output shaft bearing retainer. Leave one bolt in place until geartrain is ready to be removed from case.

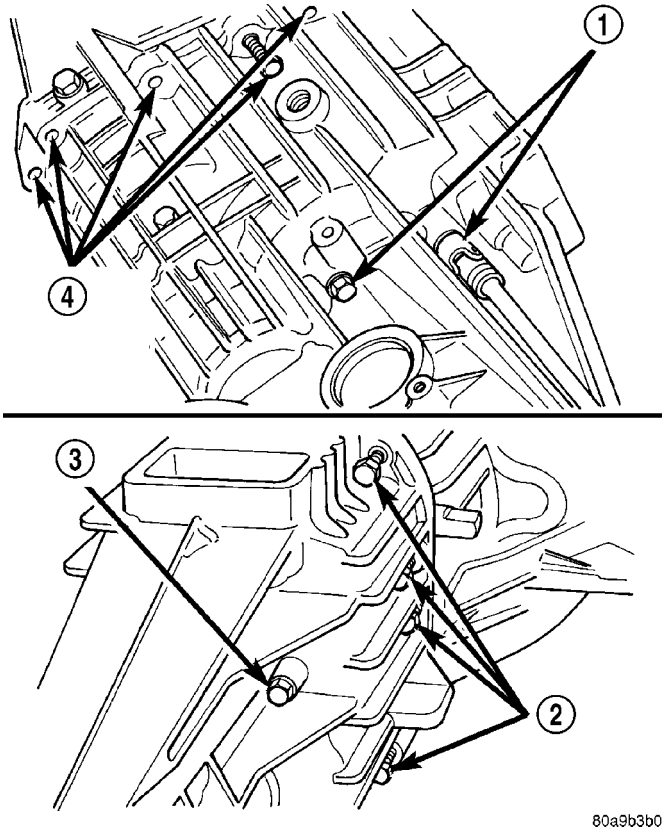

Fig. 11 HOUSING & BEARING RETAINER BOLT

1 - RETAINER BOLTS
2 - HOUSING BOLTS
3 - RETAINER BOLT
4 - HOUSING BOLT LOCATIONS

(13) Separate the housings (Fig. 12) by tapping the front housing off alignment dowels with a plastic hammer.

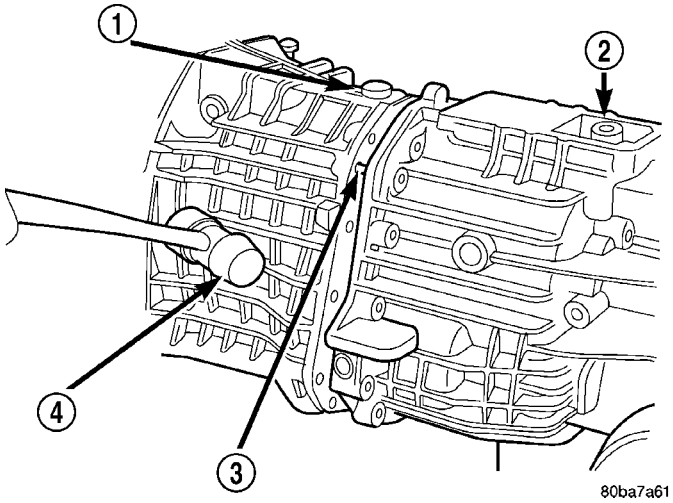

Fig. 12 FRONT HOUSING

1 - FRONT HOUSING
2 - REAR HOUSING
3 - DOWELS (2)
4 - PLASTIC MALLET

(14) Remove input shaft bearing and countershaft front bearing race (Fig. 13).

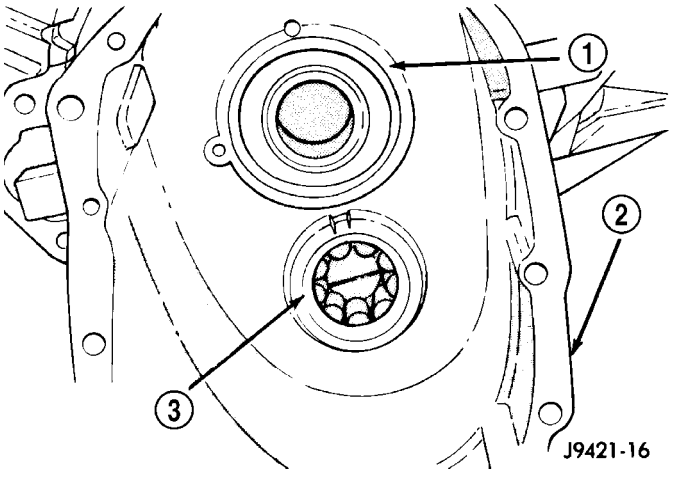

Fig. 13 Input Shaft Bearing and Countershaft Front Bearing Race

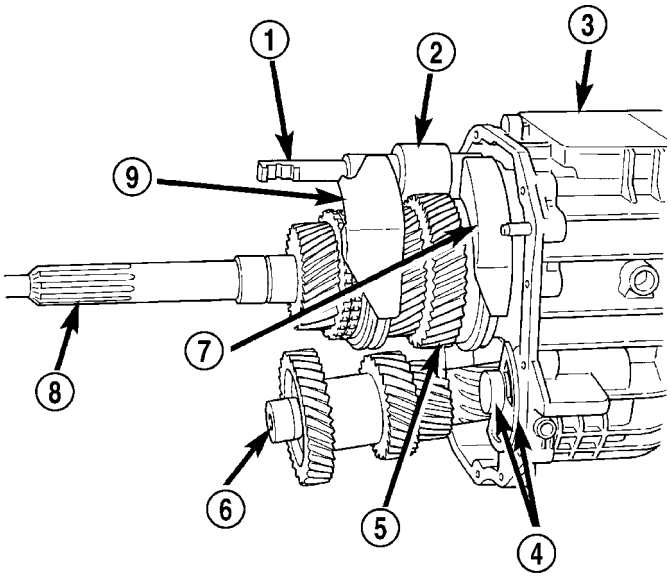
1 - INPUT SHAFT BEARING
2 - FRONT HOUSING
3 - COUNTERSHAFT FRONT BEARING

MANUAL TRANSMISSION - NV3500 (Continued)

(15) Note position of input shaft, shift shaft, forks and geartrain components in housing (Fig. 14).



80a9b3b2

8 - INPUT SHAFT
9 - 3-4 FORK

SHIFT/FORK SHAFTS AND REVERSE IDLER SEGMENT

(1) Place a shop towel over the shaft lever to contain the lever detent ball and spring.

(2) Rotate lever and bushing upward out of the shift forks and catch ball and spring (Fig. 15).

(3) Unseat shift socket roll pin with Remover 6858. Position remover on shift shaft and center tool over the roll pin. Verify tool legs are firmly seated on the shift socket (Fig. 16).

(4) Tilt socket toward the side of the case to avoid trapping the pin between the gear teeth.

(5) Tighten remover to press the roll pin downward and out of the shift socket (Fig. 16).

NOTE: Roll pin must only clear the shift shaft. Do not push the pin into the geartrain.

MANUAL TRANSMISSION - NV3500 (Continued)

(11) Remove reverse idler shaft support bolt and loosen rear reverse idler shaft bolt (Fig. 22).

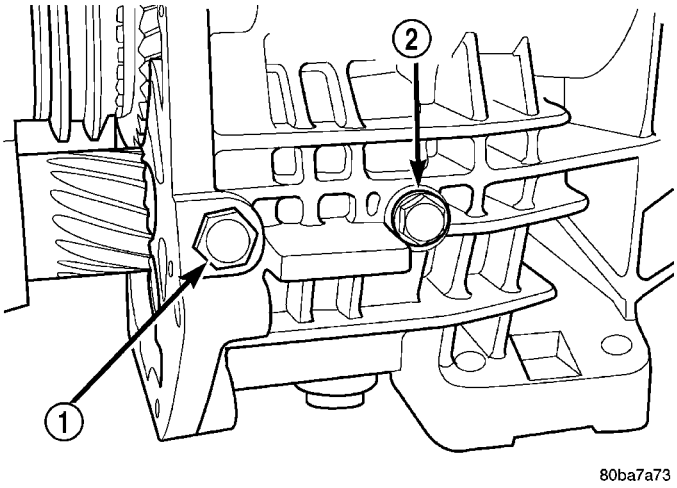

Fig. 22 REVERSE IDLER SHAFT & SUPPORT

1 - SUPPORT BOLT
2 - SHAFT BOLT

(12) Remove reverse idler shaft support segment by sliding it straight out of housing.

(13) Support geartrain and rear housing on Fixture 6747 as follows:

(a) Adjust height of reverse idler pedestal rod until the reverse idle shaft bottoms in Cup 8115.

(b) Position Adapters 6747-1A and 6747-2A on Fixture 6747.

(c) Slide fixture tool onto input shaft, countershaft and idler gear (Fig. 23).

(d) Stand geartrain and rear housing upright on fixture (Fig. 24). Have helper hold fixture tool in place while housing and geartrain is being rotated into upright position.

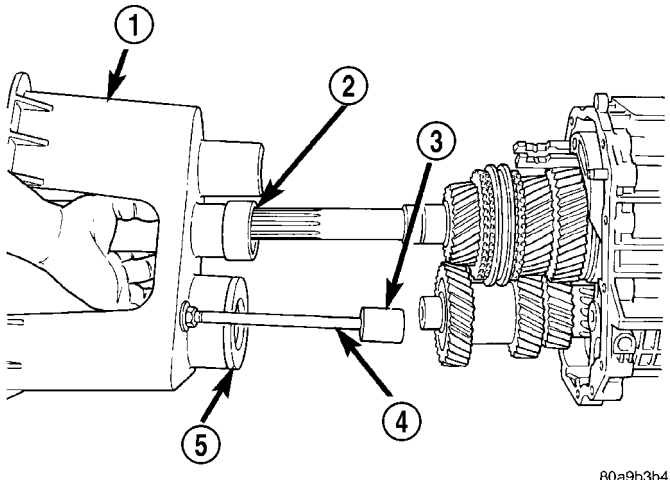

Fig. 23 FIXTURE ASSEMBLY

1 - FIXTURE 6747
2 - ADAPTER 6747-1A

5 - ADAPTER 6747-2A

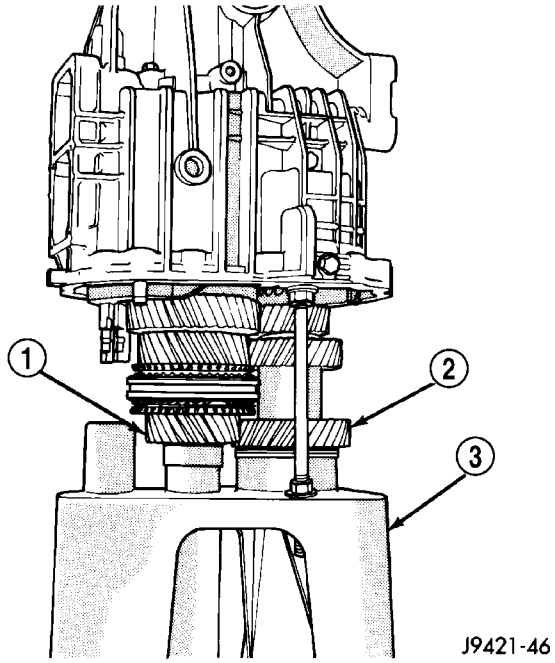

Fig. 24 GEARTRAIN & HOUSING ON FIXTURE

1 - INPUT SHAFT
2 - COUNTERSHAFT
3 - FIXTURE 6747

(14) Remove rear bolt holding reverse idler shaft in housing.

REAR HOUSING - 2WD

(1) On 2-wheel drive transmission, remove three bolts that attach output shaft bearing retainer to rear case (Fig. 25). Bolts are rear of shift tower opening.

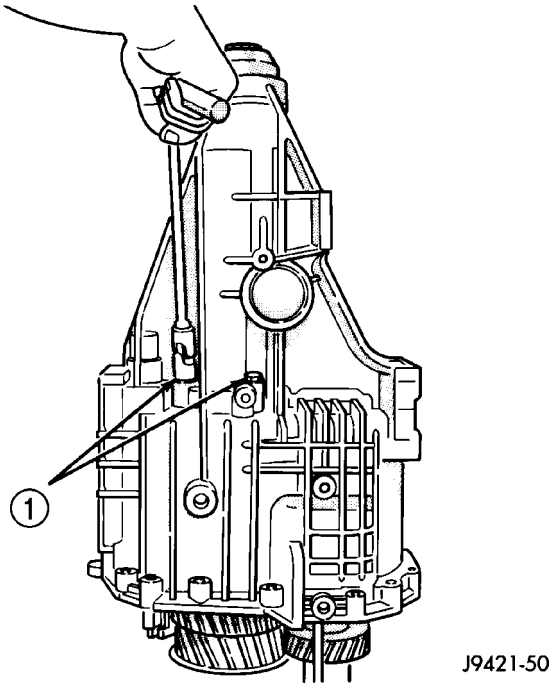

Fig. 25 OUTPUT SHAFT

1 - OUTPUT SHAFT BEARING RETAINER BOLTS (THIRD BOLT IS AT OPPOSITE SIDE OF CASE)

(2) Tap rear housing upward and off output shaft bearing with a plastic/rawhide hammer (Fig. 26).

(3) Lift rear housing up and off geartrain (Fig. 27).

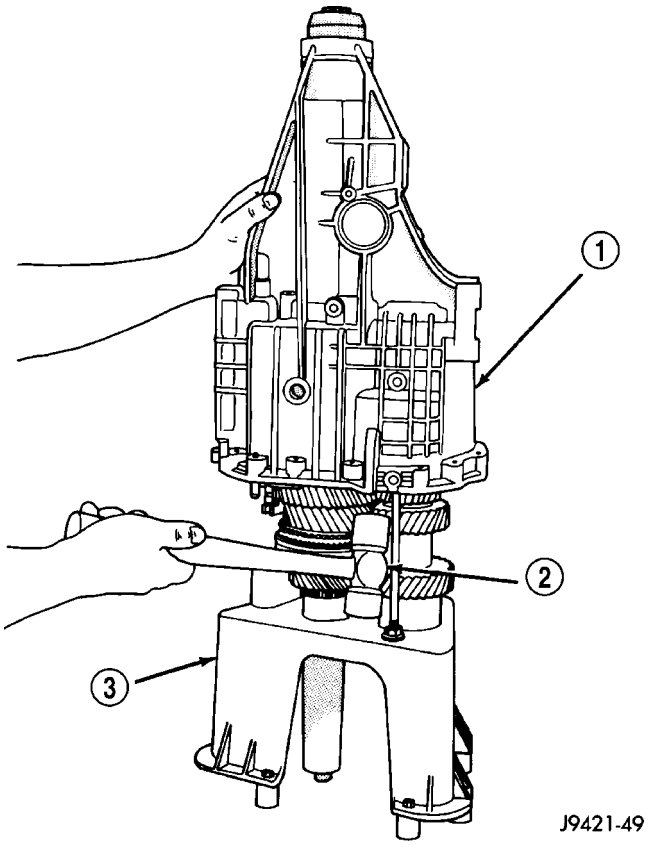

Fig. 26 SEPARATE REAR HOUSING & OUTPUT SHAFT BEARING

1 - REAR HOUSING
2 - MALLET
3 - FIXTURE

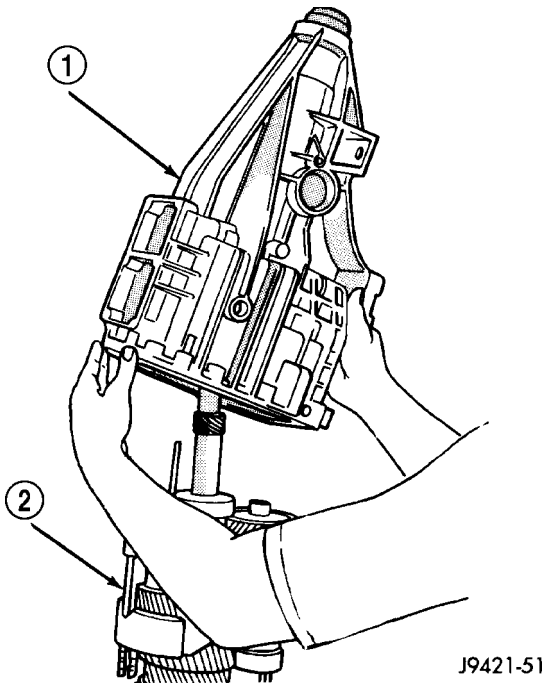

Fig. 27 REAR HOUSING - 2WD

1 - REAR HOUSING
2 - SHIFT FORKS AND GEARTRAIN

(4) Remove countershaft rear bearing from countershaft (Fig. 28).

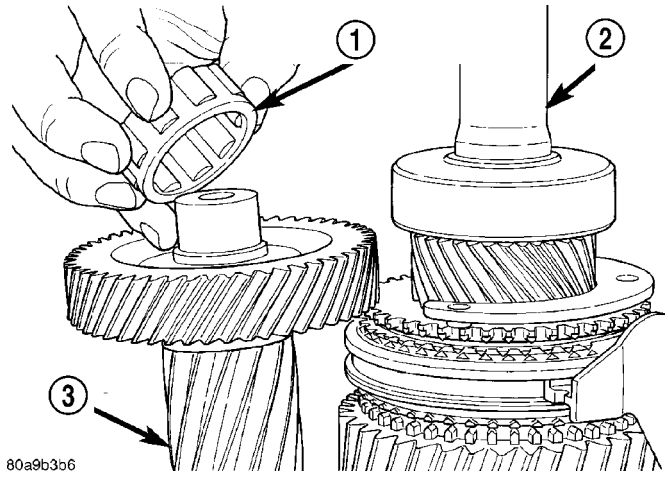

Fig. 28 COUNTERSHAFT REAR BEARING

1 - COUNTERSHAFT REAR BEARING
2 - OUTPUT SHAFT
3 - COUNTER SHAFT

REAR ADAPTER HOUSING - 4WD

(1) Inserting screw from slide hammer (Fig. 29) into one of the dimples in face of rear seal (Fig. 30) and remove seal.

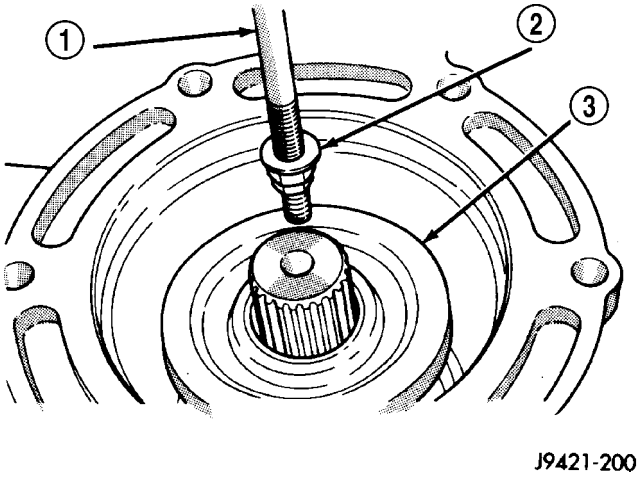

Fig. 29 REAR SEAL

1 - SLIDE HAMMER
2 - REMOVER TOOL
3 - REAR SEAL

(2) Remove rear bearing snap ring from output shaft (Fig. 31).

(3) Lift rear adapter housing upward and off geartrain (Fig. 32).

(4) Remove bearing retainer bolts and remove rear bearing retainer and rear bearing (Fig. 33). Push or tap bearing out of housing with a hammer handle if needed.

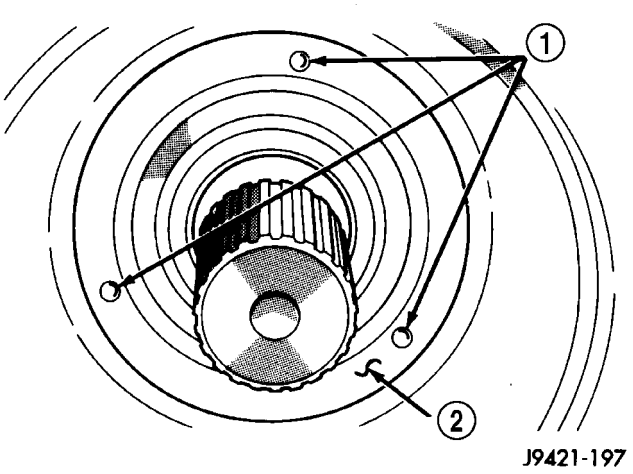

Fig. 30 REAR SEAL FACE

1 - DIMPLES
2 - SEAL FACE

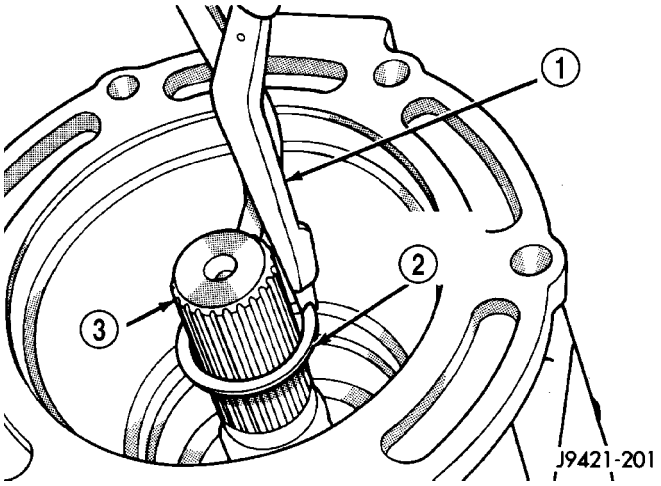

Fig. 31 REAR BEARING SNAP RING

1 - HEAVY DUTY SNAP RING PLIERS
2 - REAR BEARING SNAP RING
3 - OUTPUT SHAFT

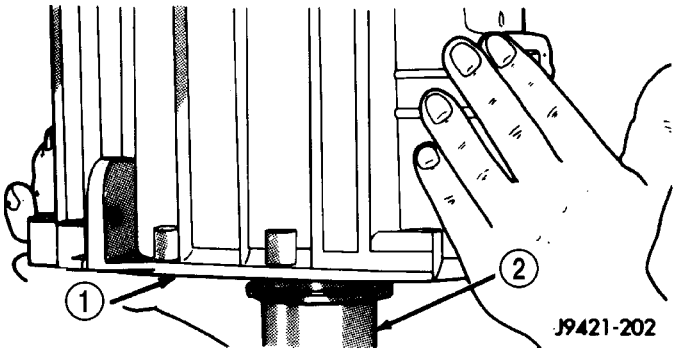

Fig. 32 REAR ADAPTER HOUSING

2 - OUTPUT SHAFT

NOTE: Housing must be replaced if race, bearing bore or idler shaft notch are worn or damaged.

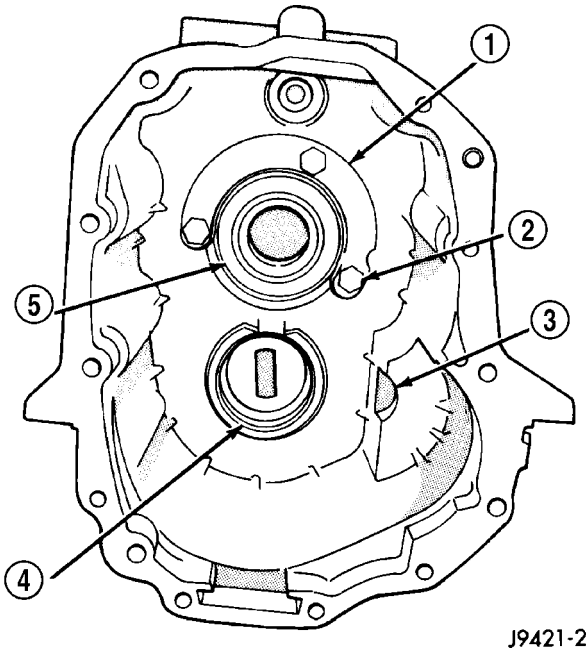

Fig. 33 REAR ADAPTER HOUSING COMPONENTS

1 - BEARING RETAINER
2 - RETAINER BOLTS (3)
3 - IDLER SHAFT NOTCH
4 - COUNTERSHAFT REAR BEARING RACE
5 - REAR BEARING

GEARTRAIN FROM FIXTURE

(1) Remove reverse idler gear assembly from assembly fixture cup.

(2) Remove 1-2 and fifth-reverse forks from synchro sleeves.

(3) Slide countershaft out of fixture tool.

(4) Remove output shaft bearing retainer from rear surface of fifth gear (retainer will drop onto gear after bolts are removed).

(5) Lift and remove output shaft and gears off input shaft.

(6) Lift and remove input shaft, pilot bearing and fourth gear synchro ring from the fixture.

OUTPUT SHAFT

NOTE: Synchronizer hubs and sleeves are different and must not be mixed. Remove each synchronizer unit as an assembly to avoid mixing parts. Mark each synchro hub and sleeve with a scriber or paint for correct assembly reference.

(1) Remove snap ring that secures 3-4 synchro hub on output shaft.

(2) Position Bearing Splitter 1130 between second and third gears and press off 3-4 synchro assembly, third gear synchro ring and third gear with a shop press.

(3) Remove third gear needle bearing (Fig. 34).

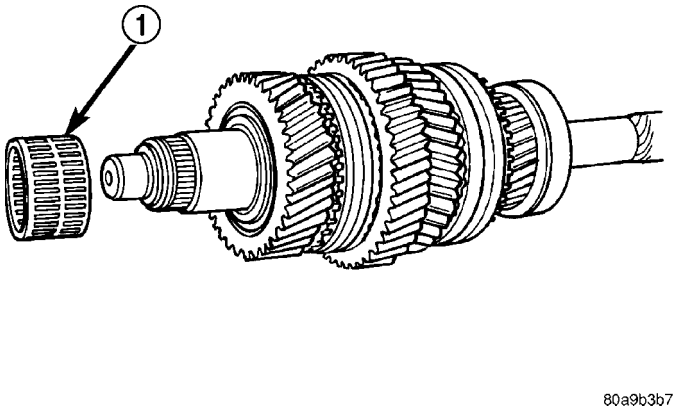

Fig. 34 THIRD GEAR NEEDLE BEARING

1 - THIRD GEAR NEEDLE BEARING

(4) Remove retaining ring that secures two-piece thrust washer on shaft with a small pry tool (Fig. 35).

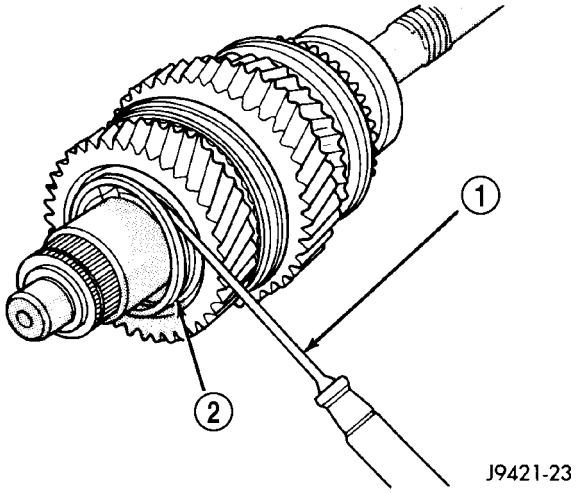

Fig. 35 THRUST WASHER

1 - PRY TOOL
2 - THRUST WASHER RETAINING RING

MANUAL TRANSMISSION - NV3500 (Continued)

(5) Remove two-piece thrust washer (Fig. 36) and note position of washer locating lugs in shaft notches for installation reference.

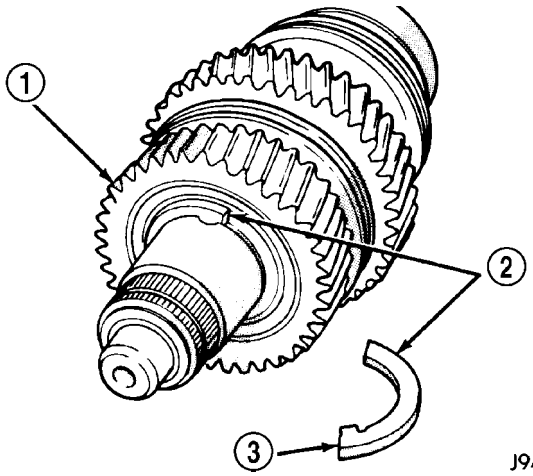

Fig. 36 TWO-PIECE THRUST WASHER

1 - SECOND GEAR
2 - THRUST WASHER (2-PIECE)
3 - WASHER LOCATING LUG

(6) Remove second gear and needle bearing (Fig. 37).

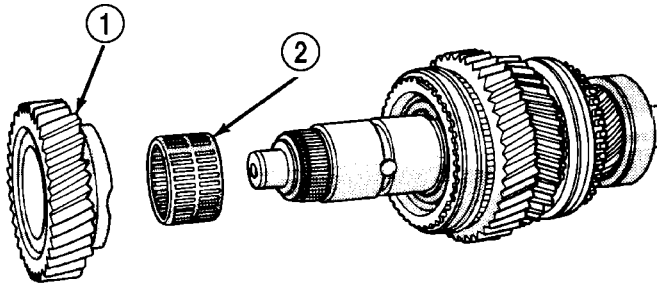

Fig. 37 SECOND GEAR

1 - SECOND GEAR
2 - SECOND GEAR NEEDLE BEARING

(7) Remove second gear synchro ring, synchro friction cone, synchro cone and interm ring (Fig. 38).

(8) Remove 1-2 synchro hub snap ring.

(9) Position Bearing Splitter 1130 between first and reverse gear. Press off 1-2 synchro hub, sleeve and first gear from output shaft with shop press (Fig. 39).

(10) Remove first gear needle bearing (Fig. 40).

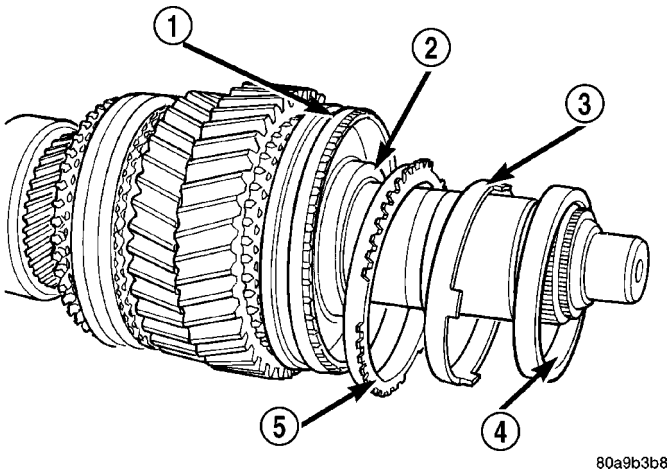

Fig. 38 SECOND GEAR SYNCHRO RING & CONES

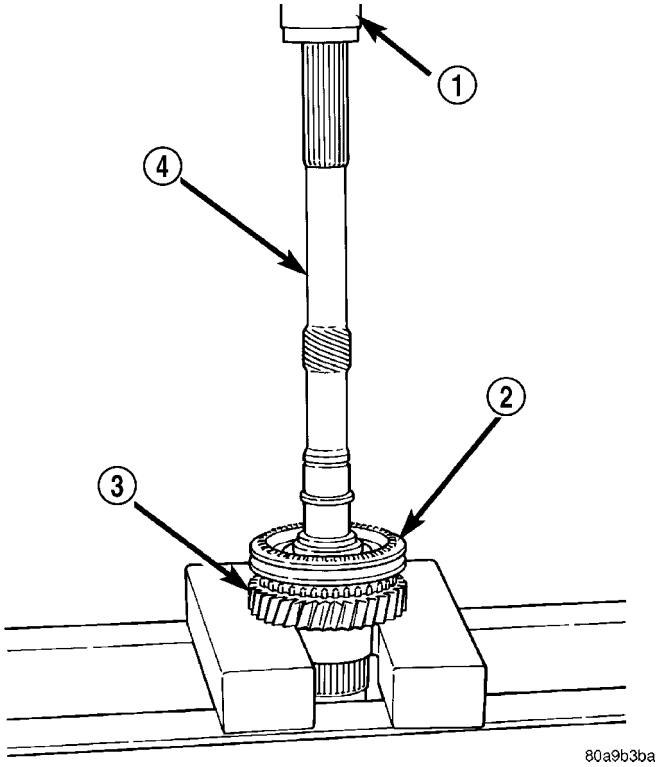

Fig. 45 FIFTH-REVERSE SYNCHRO

1 - PRESS
2 - FIFTH-REVERSE SYNCHRO HUB AND SLEEVE
3 - REVERSE GEAR
4 - OUTPUT SHAFT

(16) Remove fifth-reverse synchro hub and sleeve with shop press (Fig. 45).

(17) Remove reverse gear and needle bearing (Fig. 46).

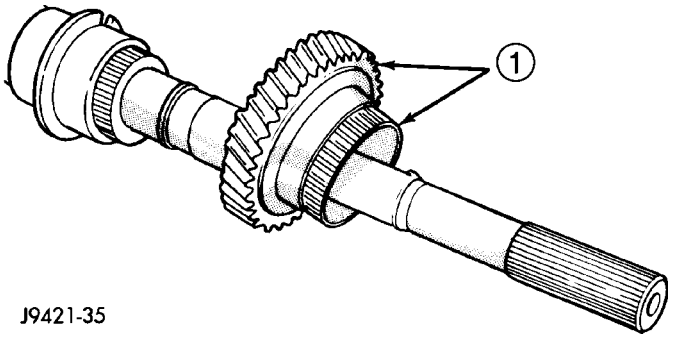

Fig. 46 REVERSE GEAR & NEEDLE BEARING

1 - REVERSE GEAR AND NEEDLE BEARING

REVERSE IDLER

(1) Remove idler gear snap rings (Fig. 47).

(2) Remove thrust washer, wave washer, thrust plate and idler gear from shaft.

(3) Remove idler gear needle bearing from shaft.

CLEANING

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean the shaft bearings with a mild solvent such as Mopar degreasing solvent, Gunk or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

9 - SNAP RING
10 - THRUST WASHER LOCKBALLS

INSPECTION

SHIFT LEVER ASSEMBLY

The shift lever assembly is not serviceable. Replace the lever and shift tower as an assembly if the tower, lever, lever ball or internal components are worn or damaged.

SHIFT SHAFT AND FORKS

Inspect the shift fork interlock arms and synchro sleeve contact surfaces (Fig. 48). Replace any fork exhibiting wear or damage in these areas. Do not attempt to salvage shift forks.

Check condition of the shift shaft detent plunger and spring. The plunger should be smooth and free of nicks or scores. The plunger spring should be straight and not collapsed, or distorted. Minor scratches or nicks on the plunger can be smoothed with 320/400 grit emery soaked in oil. Replace the plunger and spring if in doubt about condition. Check condition of detent plunger bushings. Replace if damaged.

Inspect shift shaft, shift shaft bushing, bearing, shaft lever and lever bushing that fits over the lever. Replace shaft if bent, cracked or severely scored. Minor burrs, nicks or scratches can be smoothed off with 320/400 grit emery cloth followed by polishing with crocus cloth. Replace the shift shaft bushing or bearing if damaged.

Replace the shaft lever and bushing if either part is deformed, or worn. Do not attempt to salvage these parts as shift fork binding will occur. Replace the roll pin that secures the lever to the shaft.

FRONT/REAR HOUSINGS AND BEARING RETAINERS

Inspect the housings carefully. Look for cracks, stripped threads, scored mating surfaces, damaged bearing bores or worn dowel pin holes. Minor nicks on mating surfaces can be dressed off with a fine file or emery cloth. Damaged threads can be renewed by either re-tapping or installing Helicoil inserts.

NOTE: The front housing contains the countershaft front bearing race. The rear housing contains the countershaft rear bearing race. These components are NOT serviceable items. The front housing will have to be replaced if the countershaft bearing race is loose, worn or damaged. The rear housing will have to be replaced if the countershaft rear bearing race is loose, worn or damaged.

Inspect the input shaft bearing retainer. Be sure the release bearing slide surface of the retainer is in good condition. Minor nicks on the surface can be smoothed off with 320/420 grit emery cloth and final polished with oil coated crocus cloth. Replace the retainer seal if necessary.

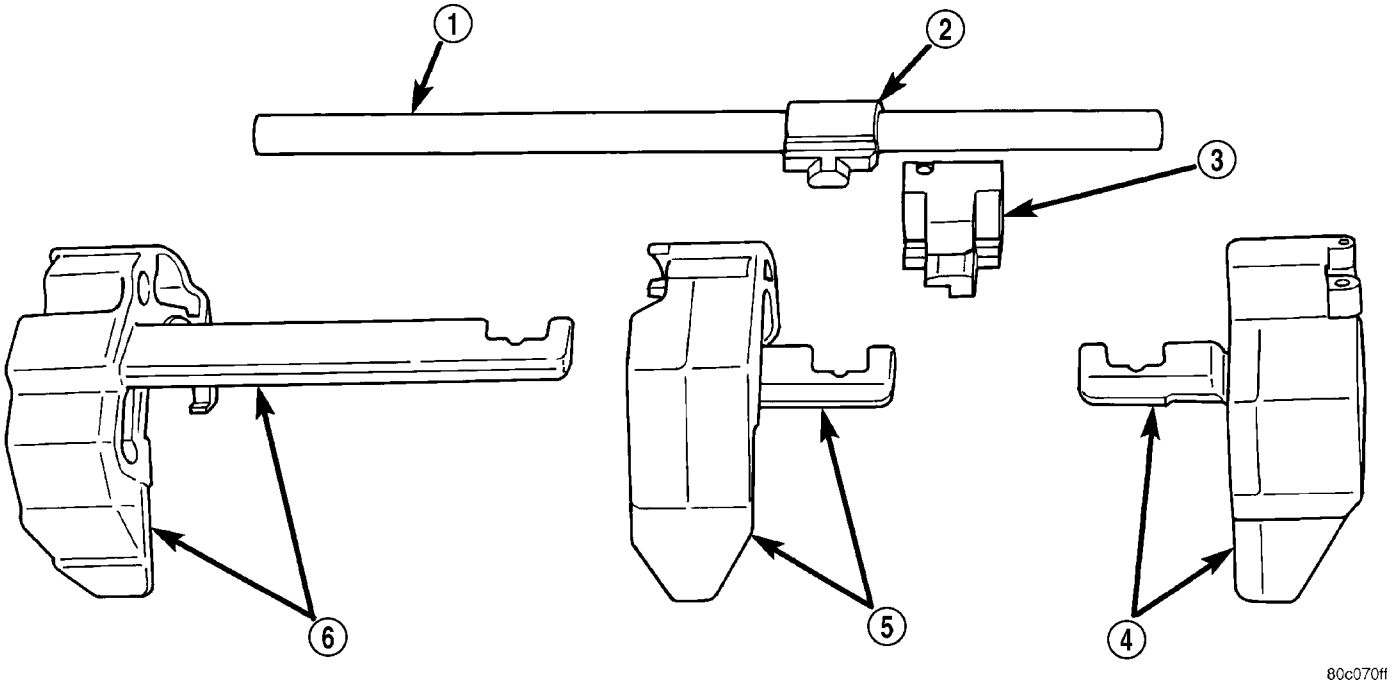

Fig. 48 Shift Forks And Shaft

1 - SHIFT SHAFT
2 - SHAFT LEVER
3 - SHAFT LEVER BUSHING
4 - 3-4 SHIFT FORK
5 - 1-2 SHIFT FORK
6 - FIFTH-REVERSE SHIFT FORK

Inspect output shaft bearing retainer, the U-shaped retainer must be flat and free of distortion. Replace the retainer if the threads are damaged or if the retainer is bent or cracked.

COUNTERSHAFT BEARINGS AND RACES

The countershaft bearings and races are machine lapped during manufacture to form matched sets. The bearings and races should not be interchanged.

NOTE: The bearing races are a permanent press fit in the housings and are NOT serviceable. If a bearing race becomes damaged, the front or rear housing must be replaced. A new countershaft bearing will be supplied with each new housing for service use.

REVERSE IDLER COMPONENTS

Inspect the idler gear, bearing, shaft, thrust washer, wave washer and thrust plate. Replace the bearing if any of the needle bearing rollers are worn, chipped, cracked, flat-spotted or brinnelled. Also replace the bearing if the plastic bearing cage is damaged or distorted.

Replace thrust washer, wave washer or thrust plate if cracked, chipped or worn. Replace idler gear if the teeth are chipped, cracked or worn thin. Replace shaft if worn, scored or the bolt threads are damaged beyond repair. Replace support segment if cracked or chipped and replace the idler attaching bolts if the threads are damaged.

Shift Socket

Inspect the shift socket for wear or damage. Replace the socket if the roll pin or shift shaft bores are damaged. Minor nicks in the shift lever ball seat in the socket can be smoothed down with 400 grit emery or wet/dry paper. Replace the socket if the ball seat is worn or cracked. Do not reuse the original shift socket roll pin. Install a **new** pin during assembly. The socket roll pin is approximately 33 mm (1-1/4 in.) long.

Output Shaft And Geartrain

Inspect all gears for worn, cracked, chipped or broken teeth. Also check condition of the bearing bore in each gear. The bores should be smooth and free of surface damage. Discoloration of the gear bores is a normal occurrence and is not a reason for replacement. Replace gears only when tooth damage has occurred or if the bores are brinnelled or severely scored.

Inspect the shaft splines and bearings surfaces. Minor nicks on the bearing surfaces can be smoothed with 320/420 grit emery and final polished with crocus cloth. Replace the shaft if the splines are damaged or bearing surfaces are deeply scored, worn or brinnelled.

ASSEMBLY

NOTE: Sealers are used at all case joints. Use Mopar Gasket Maker or equivalent for all case joints and Mopar silicone sealer or equivalent for the input shaft bearing retainer.

SYNCHRONIZER

(1) Slide sleeve onto the hub, leaving enough room to install the spring in the hub and strut in the hub groove.

(2) Install first spring in the hub, then install a strut over the spring. Verify spring is seated in the spring bore in the strut.

(3) Slide sleeve onto the hub far enough to hold the first strut and spring in place.

(4) Place detent ball in the top of the strut, then press the ball into place with a small screwdriver. Work the sleeve over the ball to hold it in place.

(5) Repeat procedure for the remaining springs, struts and balls. Use tape or rubber bands to temporarily secure each strut and ball as they are installed.

(6) Verify the synchro three springs, struts and detent balls are all in place (Fig. 49).

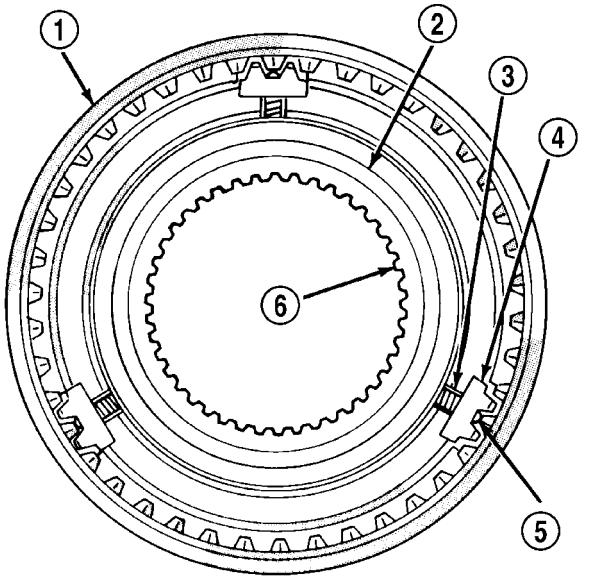

Fig. 49 SYNCHRONIZER COMPONENTS

1 - SLEEVE
2 - HUB SHOULDER
3 - SPRING (3)
4 - STRUT (3)
5 - DETENT BALL (3)
6 - HUB

MANUAL TRANSMISSION - NV3500 (Continued)

OUTPUT SHAFT

NOTE: Lubricate shaft, gears, bearings and immerse each synchro ring with recommended lubricant during assembly. Petroleum jelly can be used to hold parts in place.

(1) Install reverse gear needle bearing up against shoulder on output shaft (Fig. 50).

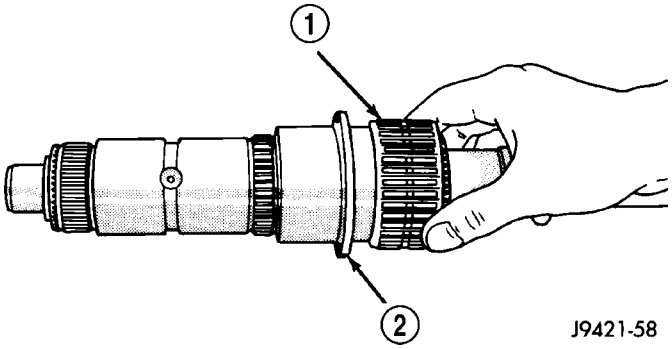

Fig. 50 REVERSE GEAR BEARING

1 - REVERSE GEAR BEARING
2 - SHOULDER

(2) Install reverse gear over needle bearing (Fig. 51).

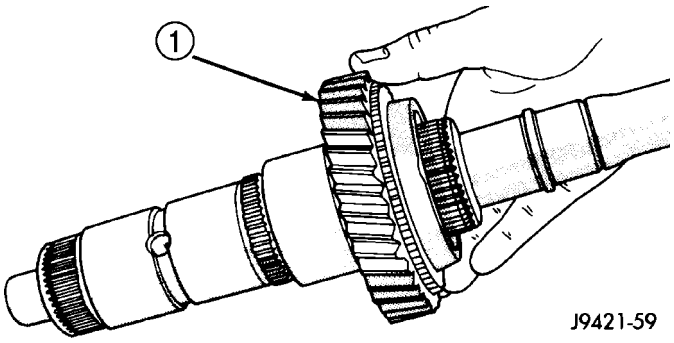

Fig. 51 REVERSE GEAR

1 - REVERSE GEAR

(3) Install brass synchro ring on reverse gear (Fig. 52).

(4) Start fifth-reverse synchro assembly on output shaft splines by hand. Then seat synchro onto shaft with shop press and Remover 6310-1 (Fig. 53).

CAUTION: One side of the hub has shoulders around the hub bore, this side faces the front of the shaft. One side of the sleeve is tapered the tapered side faces the front of the shaft.

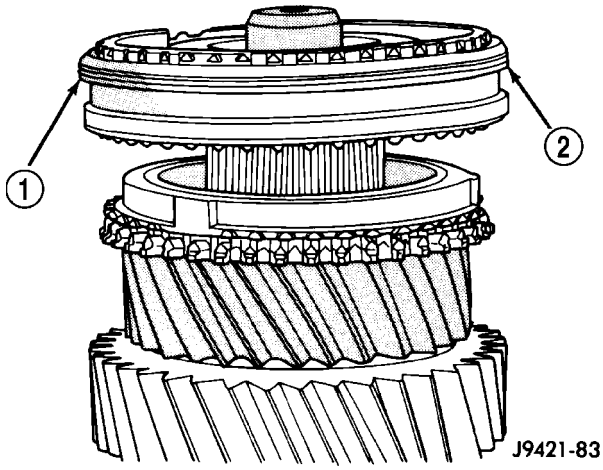

Fig. 73 3-4 SYNCHRO HUB ON OUTPUT SHAFT

1 - GROOVED SIDE OF SLEEVE
2 - 3-4 SYNCHRO ASSEMBLY

MANUAL TRANSMISSION - NV3500 (Continued)

(28) Press 3-4 synchro assembly onto output shaft with shop press and suitable size pipe (Fig. 74).

NOTE: Tool presses on hub must be as close to output shaft as possible but not contacting the shaft splines.

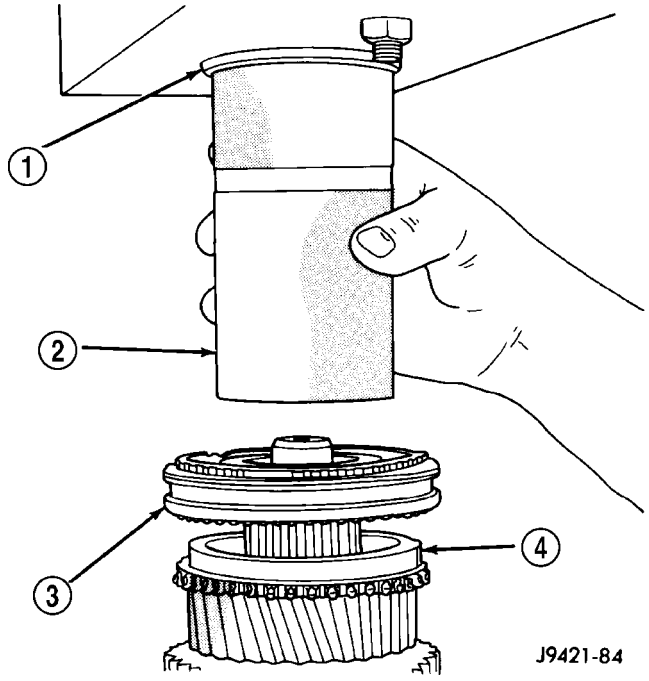

Fig. 74 3-4 SYNCHRO ON OUTPUT SHAFT

1 - PRESS RAM
2 - PIPE TOOL
3 - 3-4 SYNCHRO
4 - THIRD SPEED SYNCHRO RING

(29) Install **new** 3-4 synchro hub snap ring (Fig. 75). Verify snap ring is seated in groove.

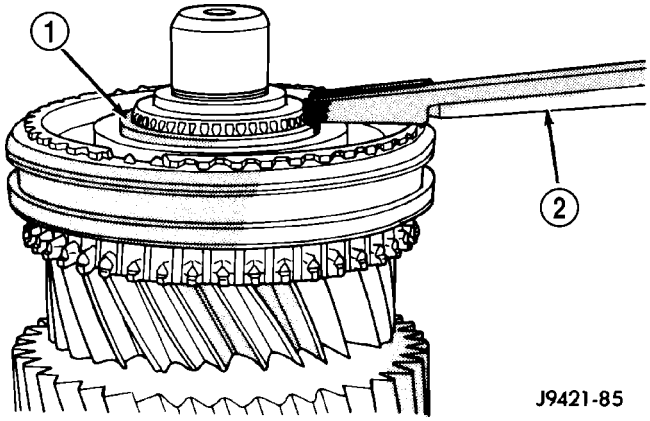

Fig. 75 3-4 SYNCHRO HUB SNAP RING

1 - 3-4 SYNCHRO HUB SNAP RING
2 - HEAVY DUTY SNAP RING PLIERS

(30) Install output shaft bearing.

(31) Install output shaft bearing snap ring with heavy duty snap ring pliers (Fig. 76). Verify snap ring is seated in shaft groove.

NOTE: Spread snap ring only enough to install it.

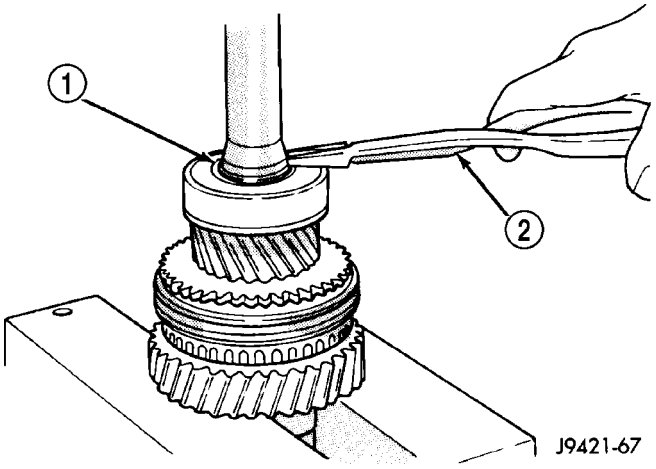

Fig. 76 OUTPUT SHAFT BEARING SNAP

1 - BEARING SNAP RING
2 - HEAVY DUTY SNAP RING PLIERS

(32) Verify position of synchro sleeves before proceeding (Fig. 77). Grooved side of 3-4 sleeve must face forward. First gear side of 1-2 sleeve must face first gear. Tapered side of fifth-reverse sleeve must face forward.

REVERSE IDLER ASSEMBLY

(1) Lubricate idler components with gear lube.

(2) Slide idler gear bearing on shaft (Fig. 78). Bearing fits either way on shaft.

(3) Slide gear onto shaft. Side of gear with recess goes to rear (Fig. 78).

(4) Place first lock ball in dimple at rear end of idler shaft (Fig. 78). Petroleum jelly can be used to hold ball in place if desired.

(5) Slide thrust rear thrust washer onto shaft and over lock ball (Fig. 79).

(6) Install snap ring in groove at rear of shaft (Fig. 79).

(7) Install lock ball in dimple at front of shaft. Hold ball in place with petroleum jelly if desired.

SHIFT SHAFT AND DETENT PLUNGER BUSHINGS/ BEARINGS

(1) Inspect shift shaft bushing and bearing for damage.

(2) If necessary, the shift shaft bushing can be replaced as follows:

(a) Locate a bolt that will thread into the bushing without great effort.

(b) Thread the bolt into the bushing, allowing the bolt to make its own threads in the bushing.

(c) Attach a slide hammer or suitable puller to the bolt and remove bushing.

(d) Use the short end of Installer 8119 to install the new bushing.

(e) Bushing is correctly installed if flush with the transmission case.

(3) If necessary, the shift shaft bearing can be replaced as follows:

(a) Locate a bolt that will thread into the bearing without great effort.

(b) Thread the bolt into the bearing as much as possible.

(c) Attach a slide hammer or suitable puller to the bolt and remove the bearing.

(d) Use the short end of Installer 8119 to install the new bearing.

(e) Bearing is correctly installed if flush with the transmission case.

(4) Inspect detent plunger bushings for damage.

NOTE: The detent plunger bushings are installed to a specific depth. The space between the two bushings when correctly installed contain an oil feed hole. Do not attempt to install the bushings with anything other than the specified tool or this oil hole may become restricted.

(5) If necessary, the detent plunger bushings can be replaced as follows:

(a) Using the long end of Installer 8119, drive the detent bushings through the outer case and into the shift shaft bore.

(b) Remove the bushings from the shift shaft bore.

(c) Install a new detent plunger bushing on the long end of Installer 8118.

(d) Start bushing in the detent plunger bore in the case.

(e) Drive bushing into the bore until the tool contacts the transmission case.

(f) Install a new detent plunger bushing on the short end of Installer 8118.

(g) Start the bushing in the detent plunger bore in the case.

(h) Drive bushing into the bore until the tool contacts the transmission case.

MANUAL TRANSMISSION - NV3500 (Continued)

GEARTRAIN ASSEMBLY

(1) Install Adapter 6747-1A on input shaft hub of Fixture 6747 (Fig. 81). Then install Adapter 6747-2A on front bearing hub of countershaft. Be sure the shoulder is seated against the countershaft.

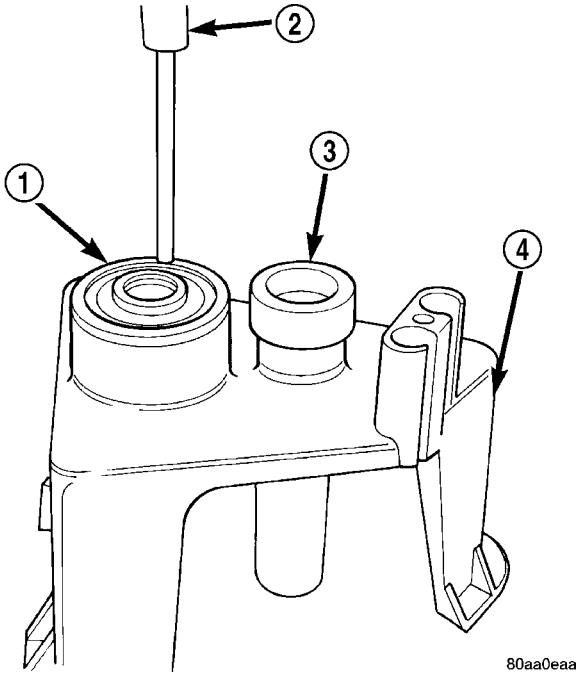

Fig. 81 FIXTURE FOR GEARTRAIN BUILD-UP

1 - ADAPTER 6747-2A
2 - CUP 8115
3 - ADAPTER 6747-1A
4 - FIXTURE 6747

(2) Install input shaft in fixture tool with Adapter Tool 6747-1A positioned under the shaft as shown (Fig. 82).

(3) Install pilot bearing in input shaft (Fig. 82).

NOTE: The side of the pilot bearing with the small diameter goes toward the input shaft.

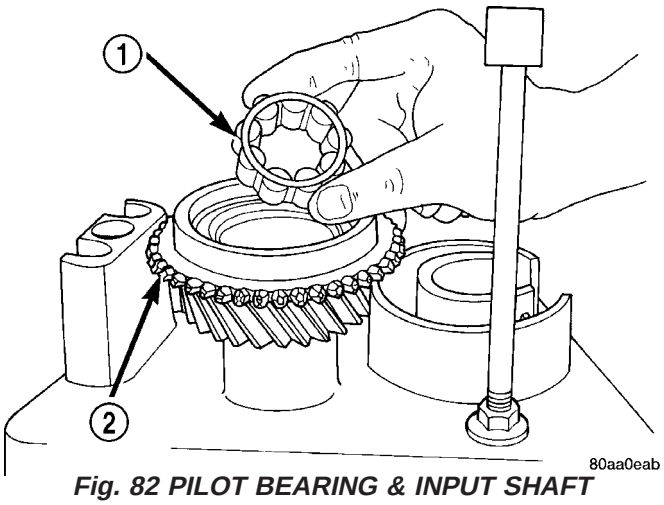

Fig. 82 PILOT BEARING & INPUT SHAFT

1 - PILOT BEARING
2 - INPUT SHAFT

(4) Install fourth gear synchro ring on input shaft (Fig. 83).

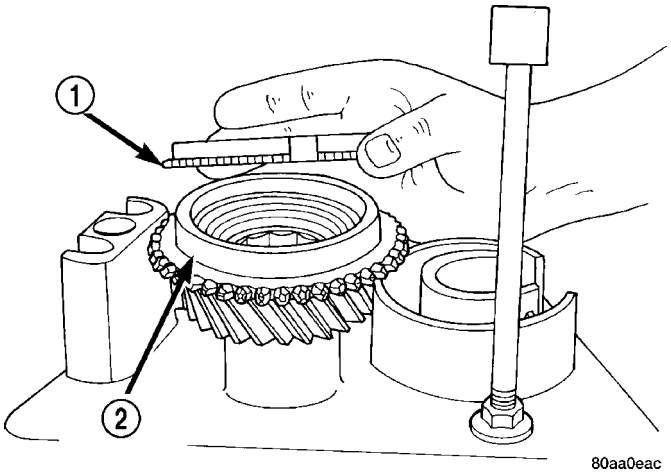

Fig. 83 FOURTH GEAR SYNCHRO

1 - FOURTH GEAR SYNCHRO RING
2 - INPUT SHAFT

(5) Adjust height of idler gear pedestal on fixture (Fig. 84). Start with a basic height of 18.4 cm (7-1/4 in.). Final adjustment can be made after gear is positioned on pedestal.

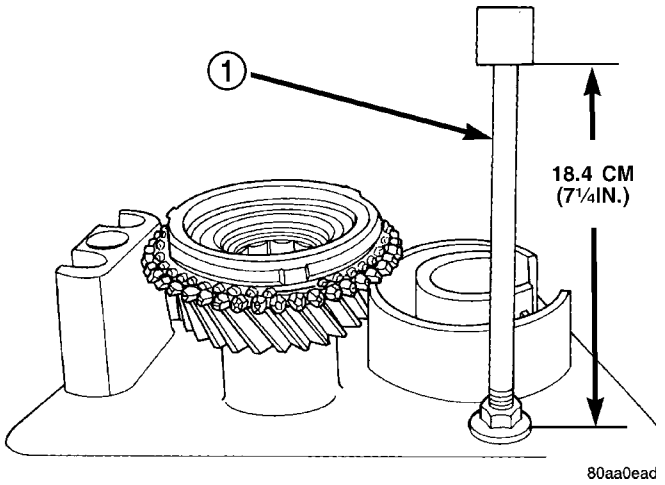

Fig. 84 IDLER PEDESTAL BASE HEIGHT

1 - REVERSE IDLER PEDESTAL

(6) Install assembled output shaft and geartrain in input shaft (Fig. 85). Carefully rotate output shaft until the 3-4 synchro ring seats in synchro hub and sleeve.

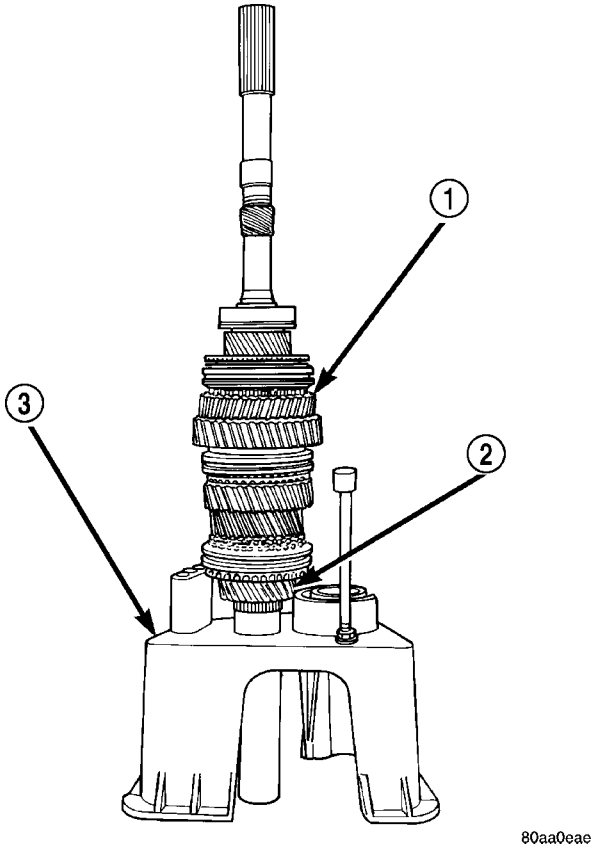

Fig. 85 OUTPUT SHAFT, GEARTRAIN & INPUT SHAFT

1 - OUTPUT SHAFT AND GEARTRAIN
2 - INPUT SHAFT
3 - FIXTURE 6747

(7) Install Adapter 6747-2A on front bearing hub of countershaft, if not previously done. The shoulder goes toward the countershaft.

(8) Slide countershaft (and adapter) into fixture slot. Verify countershaft and output shaft gears are fully meshed with the mainshaft gears before proceeding (Fig. 86).

(9) Check alignment of countershaft and output shaft gear teeth. Gears may not align perfectly a difference in height of 1.57 to 3.18 mm (1/16 to 1/8 in.) will probably exist. This will not interfere with assembly. If difference is greater than this, the countershaft adapter tool is probably upside down.

(10) Position reverse idler in support cup of fixture (Fig. 87). Verify idler gear is properly meshed and aligned with shaft gear teeth and that bolt holes are facing out from the geartrain. Adjust pedestal up or down if necessary and verify short end of idler shaft is facing up as shown.

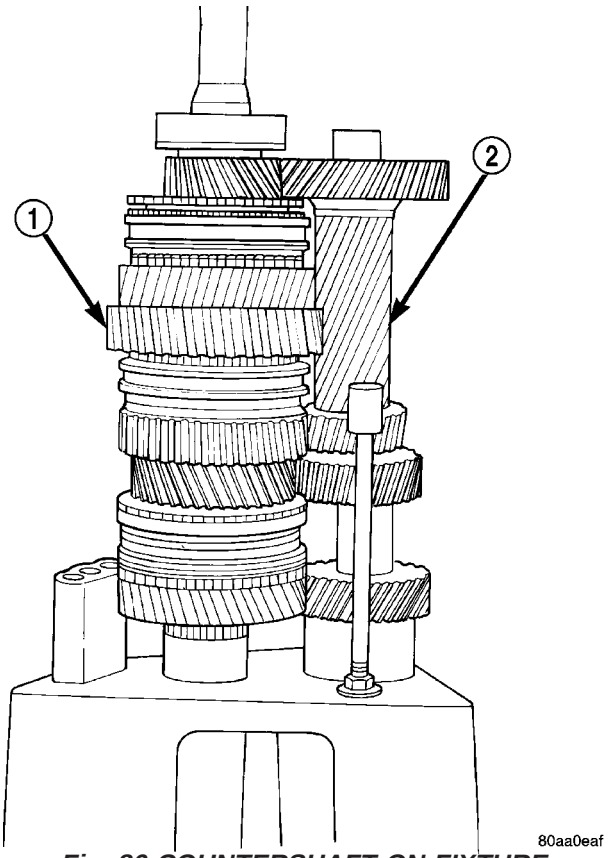

Fig. 86 COUNTERSHAFT ON FIXTURE

1 - OUTPUT SHAFT AND GEARTRAIN
2 - COUNTERSHAFT (SLIDE INTO PLACE ON FIXTURE TOOL)

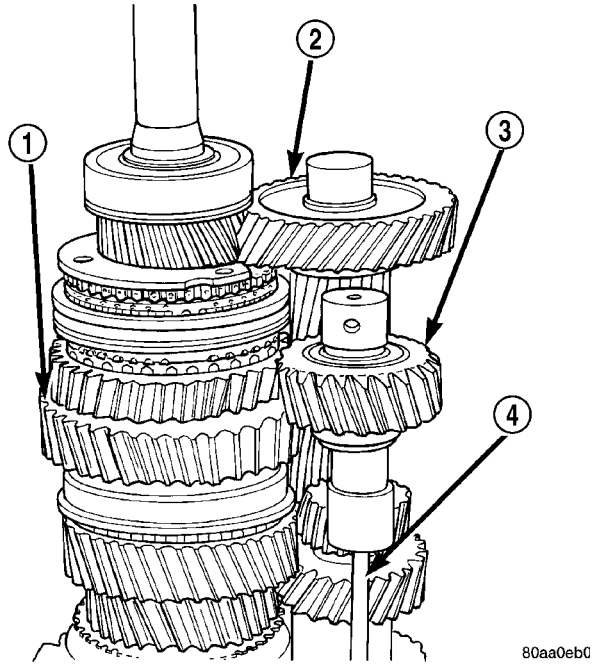

Fig. 87 REVERSE IDLER ASSEMBLY ON FIXTURE

1 - OUTPUT SHAFT AND GEARTRAIN

3 - REVERSE IDLER ASSEMBLY
4 - PEDESTAL

MANUAL TRANSMISSION - NV3500 (Continued)

(11) On 2-wheel drive transmission, thread one Alignment Pin 8120 in center or passenger side hole of output shaft bearing retainer. Then position retainer on fifth gear as shown (Fig. 88).

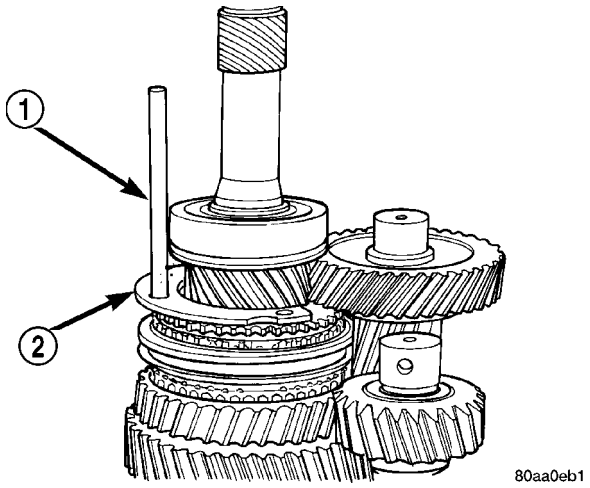

Fig. 88 ALIGN OUTPUT SHAFT BEARING RETAINER

1 - ALIGNMENT PIN
2 - OUTPUT SHAFT BEARING RETAINER

(12) Assemble 1-2 and fifth reverse-shift forks (Fig. 89). Arm of fifth-reverse fork goes through slot in 1-2 fork.

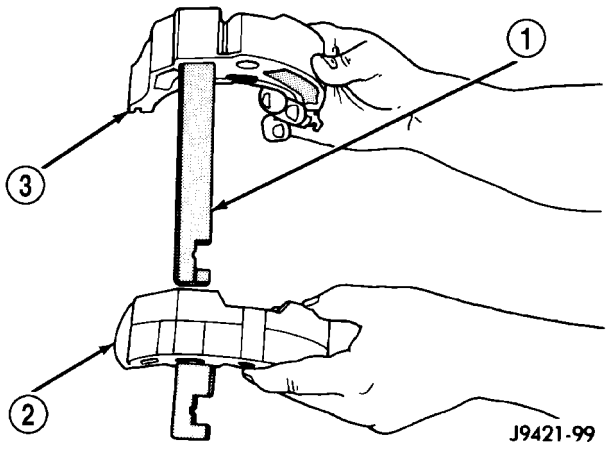

Fig. 89 1-2 & FIFTH-REVERSE SHIFT FORKS

1 - 1-2 FORK
2 - 1-2 FORK ARM
3 - FIFTH-REVERSE FORK

(13) Install assembled shift forks in synchro sleeves and verify forks are seated in sleeves (Fig. 90).

REAR HOUSING - 2WD

NOTE: Transmission shift components must be in Neutral position to prevent damaging the synchro and shift components when installing the housings.

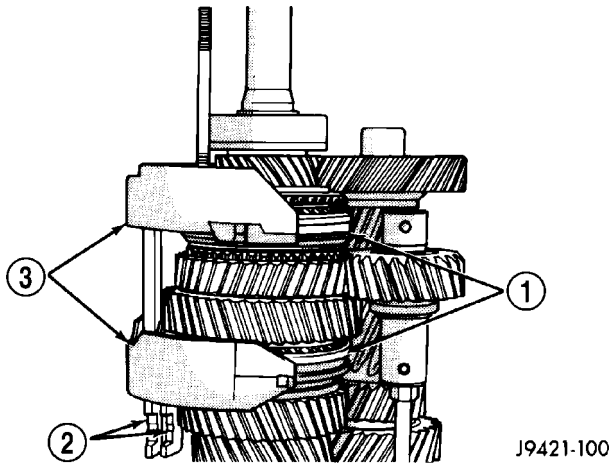

Fig. 90 SHIFT FORKS IN SYNCHRO

1 - SYNCHRO SLEEVES
2 - FORK ARMS
3 - SHIFT FORKS

(1) Drive adapter housing alignment dowels back into housing until dowels are flush with mounting surface (Fig. 91).

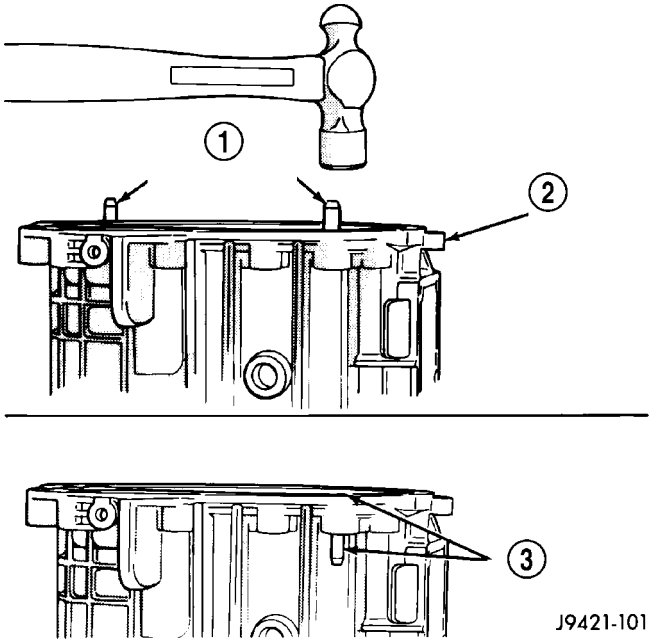

Fig. 91 REAR HOUSING DOWELS

1 - HOUSING ALIGNMENT DOWELS
2 - REAR HOUSING
3 - DOWEL FLUSH WITH SURFACE

(2) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(3) Install countershaft rear bearing in bearing race (Fig. 92).

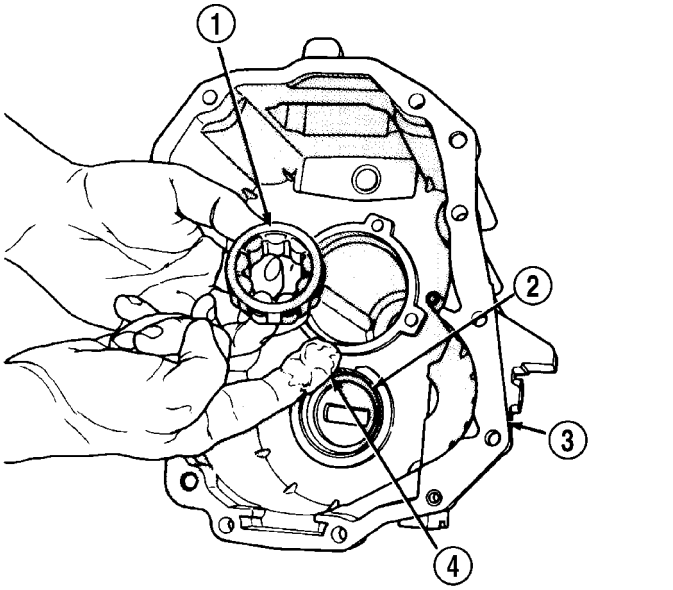

Fig. 92 COUNTERSHAFT REAR BEARING

1 - COUNTERSHAFT REAR BEARING
2 - REAR BEARING RACE
3 - REAR HOUSING
4 - PETROLEUM JELLY

NOTE: Large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 93).

(4) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(5) Apply light coat of petroleum jelly to shift shaft bushing/bearing in rear housing (Fig. 93).

(6) Reach into countershaft rear bearing with finger and push each bearing roller outward against the race. Then apply extra petroleum jelly to hold rollers in place during housing installation.

(7) Install rear housing onto geartrain (Fig. 94) and verify bearing retainer pilot stud is in correct bolt hole in housing. Verify countershaft and output shaft bearings are aligned in housing and on countershaft.

NOTE: It may be necessary to lift upward on countershaft slightly to ensure that the countershaft rear bearing engages to the countershaft before the rear output shaft bearing engages the housing.

(8) Seat rear housing on output shaft rear bearing and countershaft by tapping the housing with a plastic mallet.

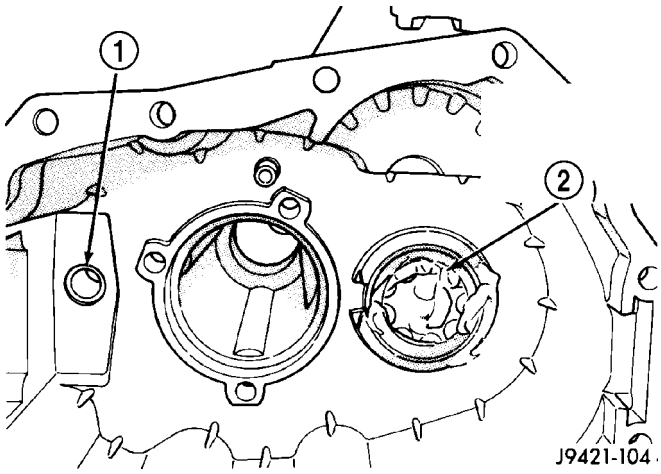

Fig. 93 COUNTERSHAFT BEARING

1 - SHIFT SHAFT BUSHING/BEARING
2 - COUNTERSHAFT REAR BEARING

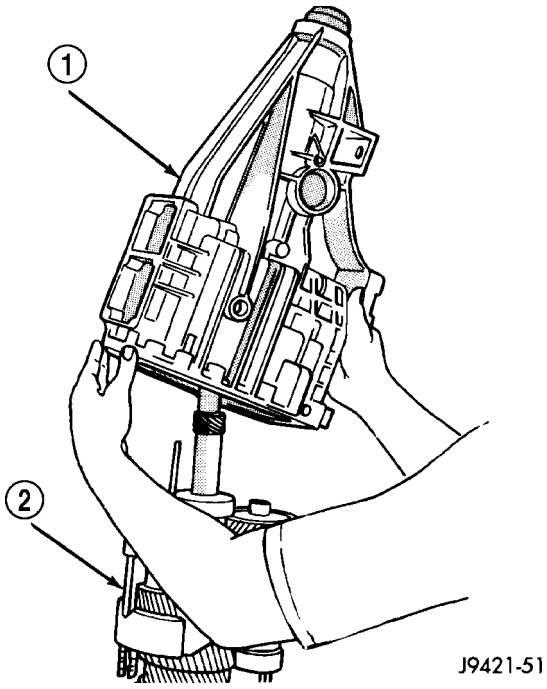

Fig. 94 REAR HOUSING

1 - REAR HOUSING
2 - SHIFT FORKS AND GEARTRAIN

MANUAL TRANSMISSION - NV3500 (Continued)

(9) Apply Mopar Gasket Maker or equivalent to housing bolt threads, bolt shanks and under bolt heads (Fig. 95).

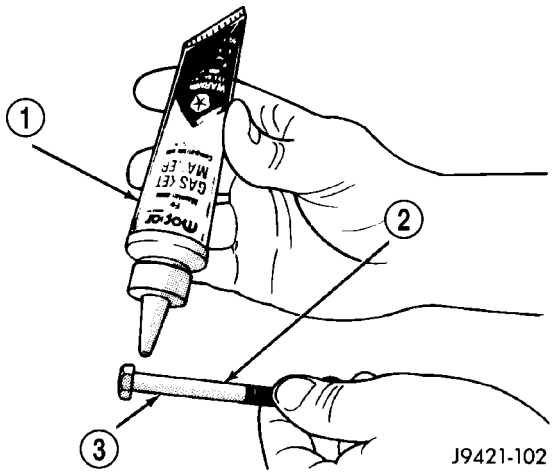

Fig. 95 HOUSING BOLTS

1 - GASKET MAKER
2 - RETAINER AND HOUSING BOLTS
3 - APPLY SEALER TO UNDERSIDE OF BOLT HEAD, SHANK AND THREADS

(10) Start first two bolts in retainer (Fig. 96). It may be necessary to move retainer rearward (with pilot stud) in order to start bolts in retainer.

(11) Remove Alignment Pin 8120 and install last retainer bolt (Fig. 96).

(12) Tighten retainer bolts to 30-35 N·m (22-26 ft. lbs.).

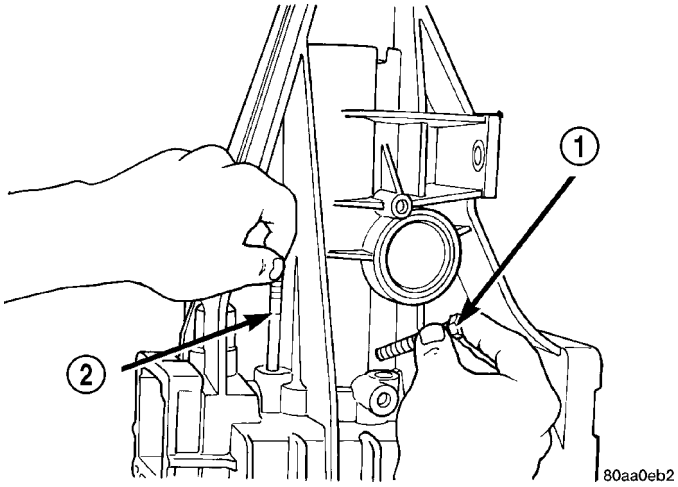

Fig. 96 Alitgnment Pin And Retainer Bolts

1 - BEARING RETAINER BOLT
2 - ALIGNMENT PIN

ADAPTER HOUSING - 4WD

NOTE: Transmission shift components must be in Neutral to prevents damaging to the synchro and shift components when installing the housings.

(1) Install rear bearing in adapter housing. Use wood hammer handle or wood dowel to tap bearing into place.

(2) Position rear bearing retainer in adapter housing (Fig. 97).

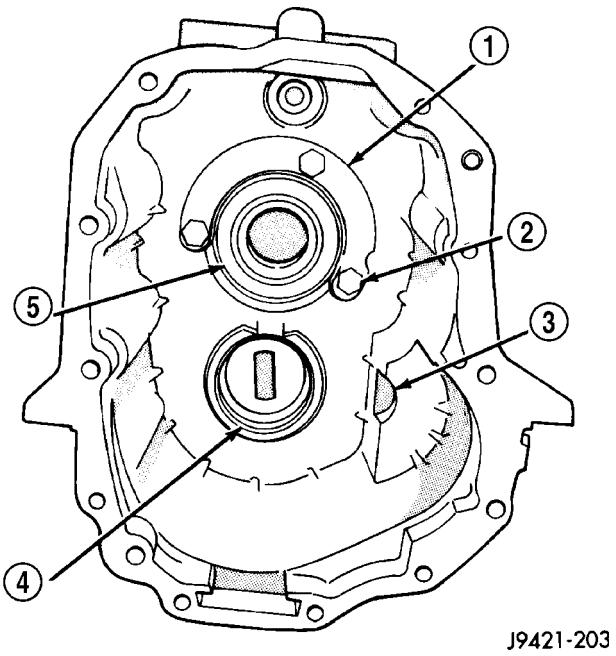

Fig. 97 ADAPTER HOUSING

1 - BEARING RETAINER
2 - RETAINER BOLT
3 - IDLER SHAFT NOTCH
4 - COUNTERSHAFT BEARING RACE
5 - REAR BEARING

(3) Apply Mopar Gasket Maker or equivalent to threads, bolt shanks and under hex heads of bearing retainer bolts (Fig. 95).

(4) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(5) Install countershaft rear bearing in bearing race (Fig. 93).

NOTE: Large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 93).

(6) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(7) Apply light coat of petroleum jelly to shift shaft bushing/bearing in adapter housing (Fig. 93).

(8) Install adapter housing on geartrain.

(9) Install rear bearing snap ring on output shaft (Fig. 98).

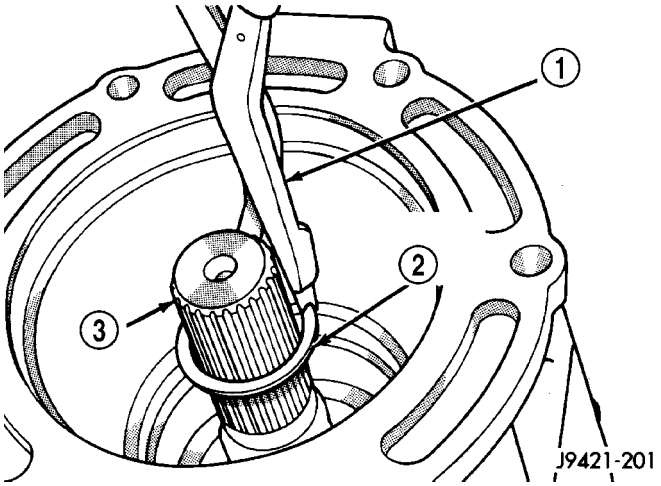

Fig. 98 REAR BEARING SNAP RING

1 - SNAP RING PLIERS
2 - SNAP RING
3 - OUTPUT SHAFT

(10) Lubricate lip of new rear seal (Fig. 99) with Mopar Door Ease, or transmission fluid.

(11) Install **new** rear seal in adapter housing bore with Installer C-3860-A. Verify seal is seated in housing bore (Fig. 99).

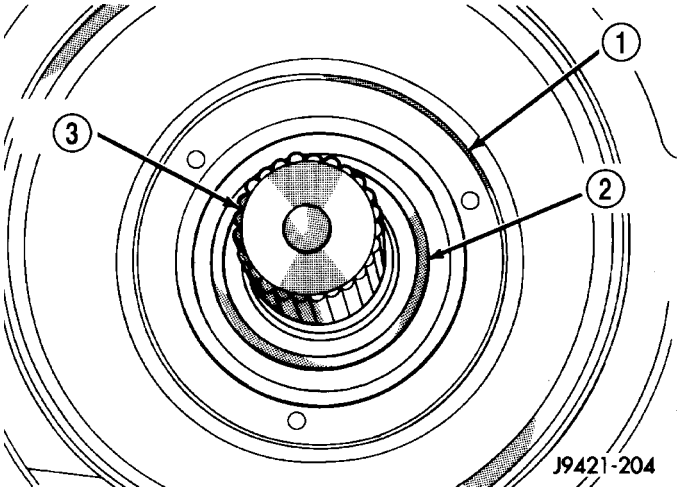

Fig. 99 ADAPTER HOUSING REAR SEAL

1 - REAR SEAL
2 - SEAL LIP
3 - OUTPUT SHAFT

SHIFT SHAFT, SHAFT LEVER AND BUSHING AND SHIFT SOCKET

(1) Verify all synchro sleeves are in Neutral position (centered on hub).

CAUTION: Transmission synchros must all be in Neutral position to prevent damaging the housings, shift forks and gears while installing the housings.

(2) Install 3-4 shift fork in synchro sleeve (Fig. 100). Verify groove in fork arm is aligned with grooves in 1-2 and fifth-reverse fork arms as shown.

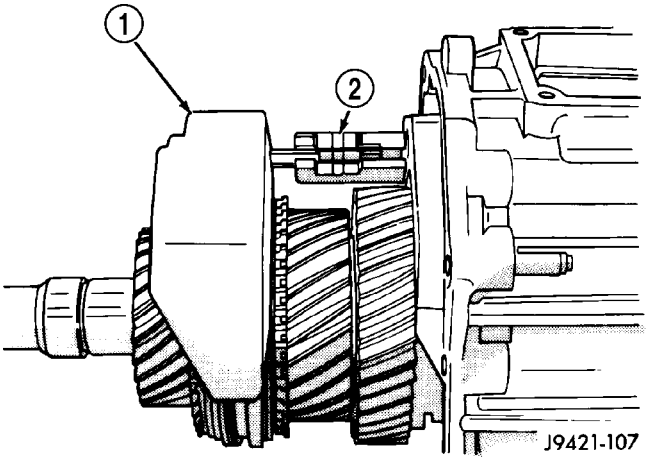

Fig. 100 3-4 SHIFT FORK

1 - 3-4 FORK
2 - ALIGN GROOVES IN FORK ARMS

(3) Slide shift shaft through 3-4 shift fork (Fig. 101).

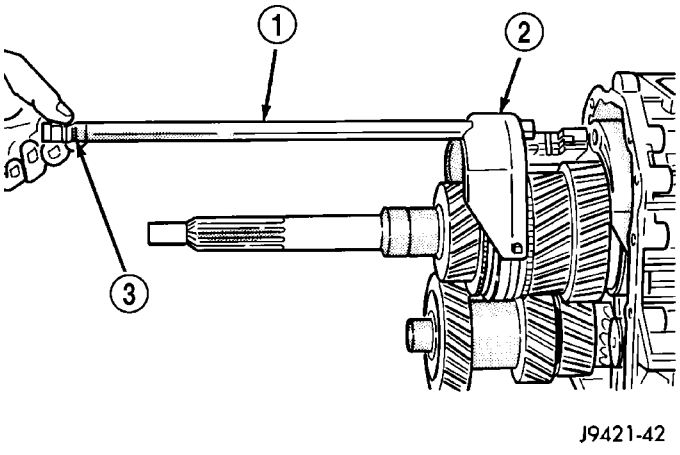

Fig. 101 SHIFT SHAFT

1 - SHIFT SHAFT
2 - 3-4 FORK
3 - SHAFT DETENT NOTCHES

MANUAL TRANSMISSION - NV3500 (Continued)

(4) Assemble shift shaft shift lever and bushing (Fig. 102). Verify slot in bushing is facing up and roll pin hole for lever is aligned with hole in shaft.

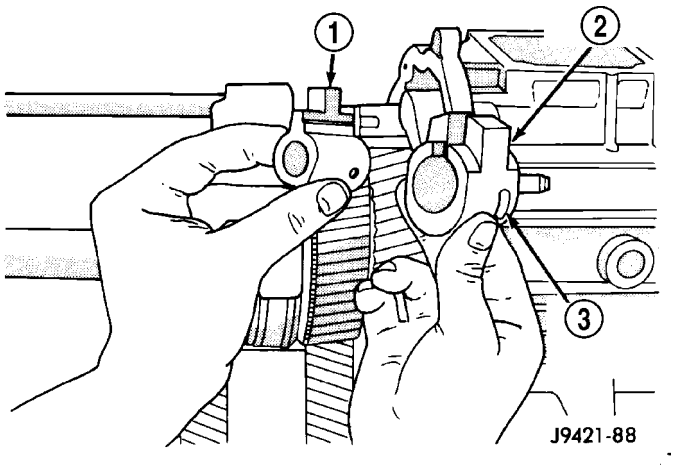

Fig. 102 SHIFT SHAFT LEVER AND BUSHING

1 - SHAFT LEVER
2 - LEVER BUSHING
3 - BUSHING LOCK PIN SLOT

(5) Install assembled lever and bushing on shift shaft (Fig. 103).

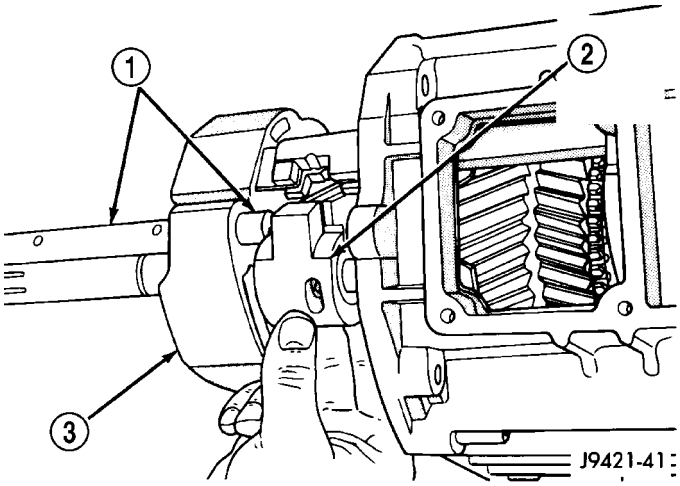

Fig. 103 SHIFT SHAFT LEVER AND BUSHING

1 - SHIFT SHAFT
2 - SHAFT LEVER AND BUSHING
3 - 3-4 FORK

(6) Slide shift shaft through 1-2 and fifth-reverse fork and into shift lever opening in rear housing (Fig. 104).

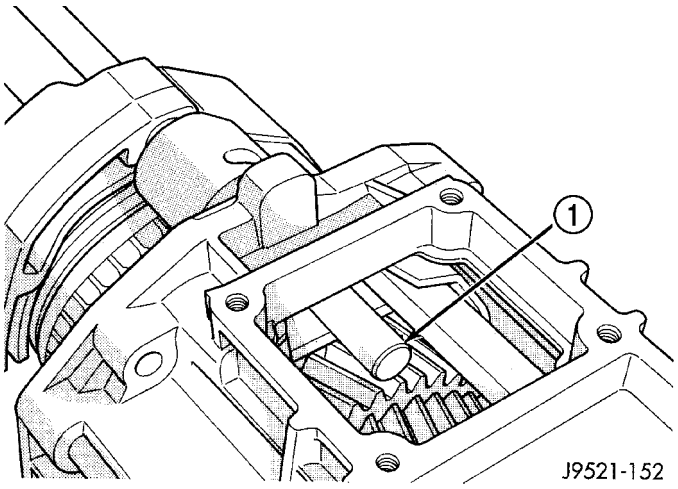

Fig. 104 SHAFT LEVER OPENING

1 - SHIFT SHAFT

(7) Align shift socket with shaft and slide shaft through socket and into shift shaft bearing in rear housing (Fig. 105).

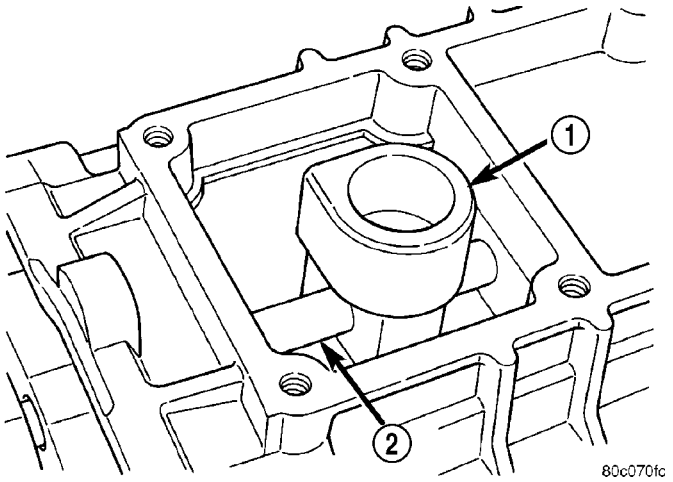

Fig. 105 SHIFT SOCKET

1 - SHIFT SOCKET
2 - SHIFT SHAFT

(8) Rotate shift shaft so detent notches in shaft are facing the TOP of the transmission housing.

CAUTION: Both shaft roll pins can be installed when the shaft is 180° off. If this occurs, the transmission will have to be disassembled again to correct shaft alignment.

MANUAL TRANSMISSION - NV3500 (Continued)

(9) Select correct **new** roll pin for shift shaft lever (Fig. 106). Shaft lever roll pin is approximately 22 mm (7/8 in.) long. Shift socket roll pin is approximately 33 mm (1-1/4 in.) long.

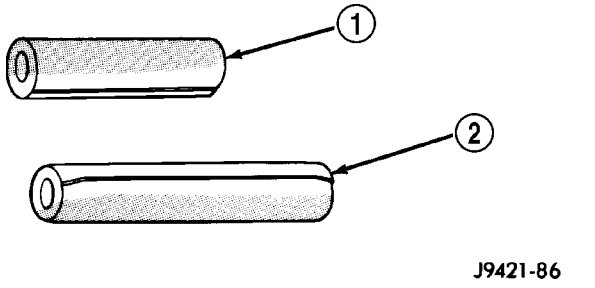

Fig. 106 ROLL PIN IDENTIFICATION

1 - SHAFT LEVER ROLL PIN
2 - SHIFT SOCKET ROLL PIN

(10) Align roll pin holes in shift shaft, lever and bushing. Then start roll pin into shaft lever by hand (Fig. 107).

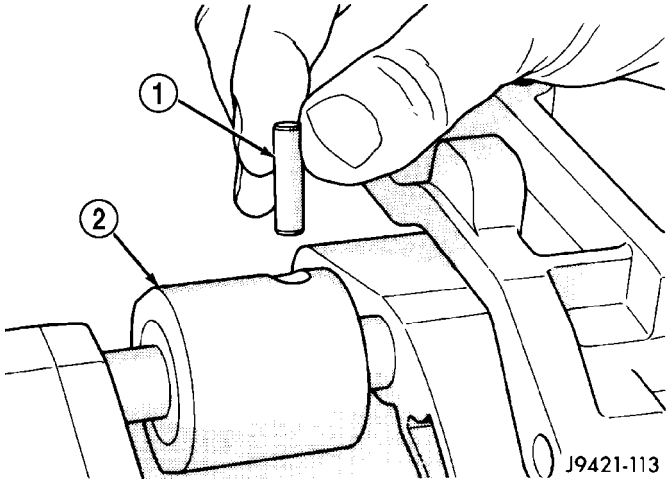

Fig. 107 SHIFT SHAFT ROLL PIN

1 - SHAFT LEVER ROLL PIN
2 - LEVER AND BUSHING

(11) Seat shaft lever roll pin with pin punch (Fig. 108).

CAUTION: Shaft lever roll pin must be flush with the surface of the lever. The lever bushing will bind on the roll pin if the pin is not seated flush.

(12) Verify that lock pin slot in lever bushing is positioned as shown (Fig. 108).

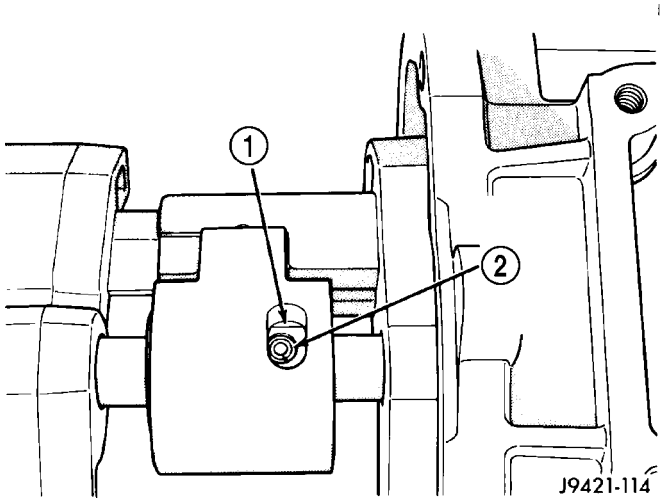

Fig. 108 SHIFT SHAFT/LEVER ROLL PIN

1 - BUSHING LOCK PIN SLOT
2 - SEAT ROLL PIN FLUSH WITH LEVER

(13) Align roll pin holes in shift socket and shift shaft. Then start roll pin into shift shaft by hand (Fig. 109).

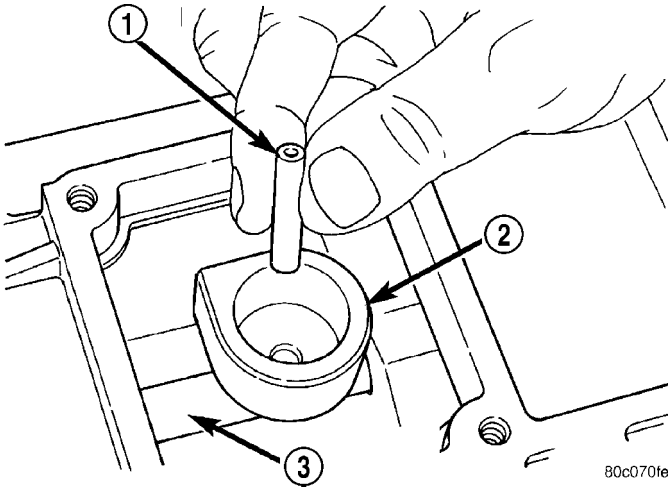

Fig. 109 SHIFT SOCKET ROLL PIN

1 - ROLL PIN
2 - SHIFT SOCKET
3 - SHIFT SHAFT

MANUAL TRANSMISSION - NV3500 (Continued)

(14) Seat roll pin in shift socket with pin punch. Roll pin must be flush with socket after installation (Fig. 110).

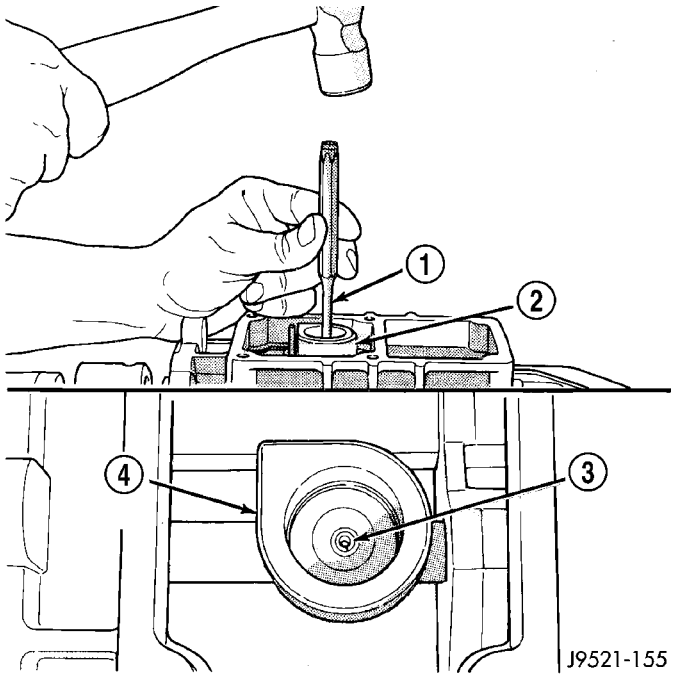

Fig. 110 SEAT SHIFT SOCKET

1 - PIN PUNCH
2 - SHIFT SOCKET
3 - SEAT ROLL PIN FLUSH
4 - SHIFT SOCKET

(15) Verify that notches in shift fork arms are aligned (Fig. 111). Realign arms if necessary.

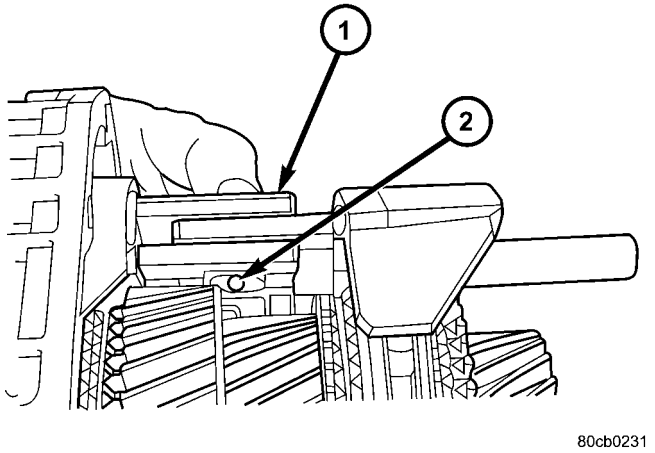

Fig. 111 SHIFT LEVER POSITION

1 - SHIFT FORK ARMS
2 - DETENT BORE

(16) Rotate shift lever and bushing downward to expose detent bore in the lever.

(17) Install detent spring then the ball into the detent bore (Fig. 112) and hold the ball in the lever. Then rotate the lever upward into the fork arm notches.

NOTE: Verify detent ball is seated in the fork arms before proceeding.

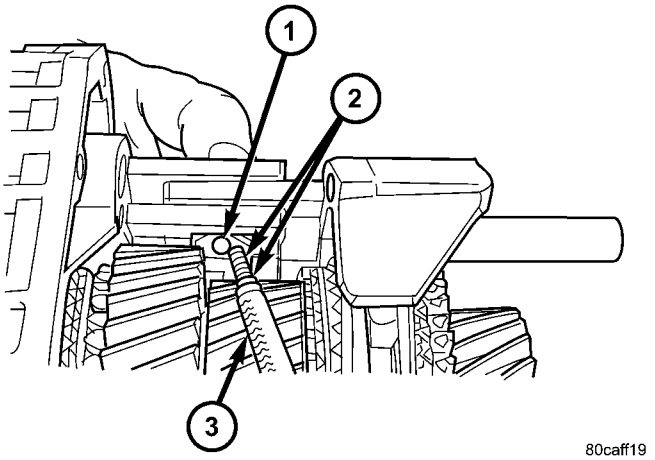

Fig. 112 DETENT SPRING AND BALL

1 - SHAFT LEVER
2 - SPRING AND BALL
3 - MAGNET

FRONT HOUSING AND INPUT SHAFT BEARING RETAINER

(1) If previously removed, install input shaft bearing in front housing bore (Fig. 113). Install snap ring and use plastic mallet to seat bearing. Bearing goes in from front side of housing only.

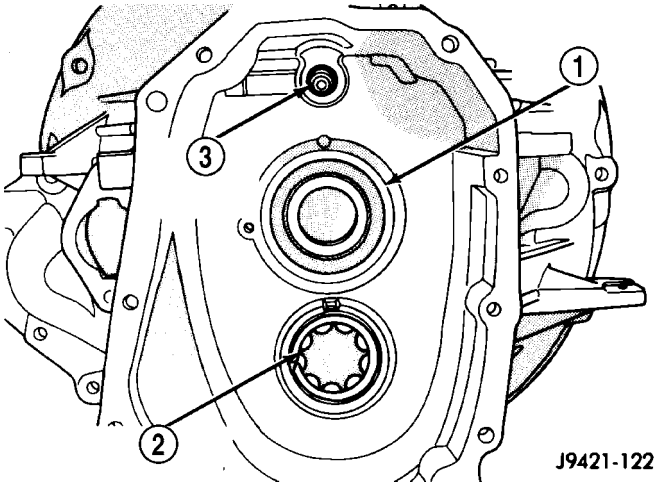

Fig. 113 INPUT SHAFT & COUNTERSHAFT BEARING

1 - INPUT SHAFT BEARING
2 - COUNTERSHAFT FRONT BEARING
3 - SHIFT SHAFT BUSHING

MANUAL TRANSMISSION - NV3500 (Continued)

(2) Apply liberal quantity of petroleum jelly to countershaft front bearing. Then insert bearing in front housing race (Fig. 113). Large diameter side of bearing cage goes toward countershaft (Fig. 114). Small diameter side goes toward bearing race in housing.

(3) Reach into countershaft front bearing with finger and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place during housing installation.

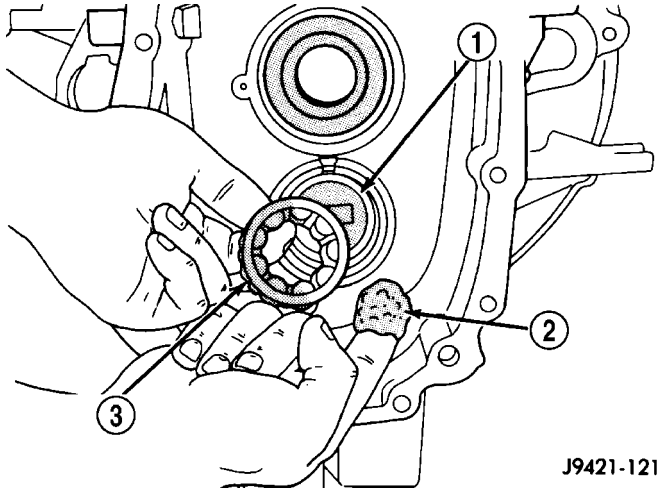

Fig. 114 COUNTERSHAFT FRONT BEARING

1 - BEARING RACE
2 - PETROLEUM JELLY
3 - COUNTERSHAFT FRONT BEARING

(4) Apply small amount of petroleum jelly to shift shaft bushing in front housing.

(5) Apply 1/8 in. wide bead of Mopar Gasket Maker or equivalent to mating surfaces of front and rear housings (Fig. 115).

(6) Have helper hold rear housing and geartrain in upright position. Then install front housing on rear housing and geartrain.

(7) Work front housing downward onto geartrain until seated on rear housing.

CAUTION: Front housings will not seat if shift components are not in Neutral or one or more components are misaligned. Do not force the front housing into place.

(8) Tap rear housing alignment dowels back into place with hammer and pin punch. Both dowels should be flush fit in each housing. Have helper hold transmission upright while dowels are tapped back into place.

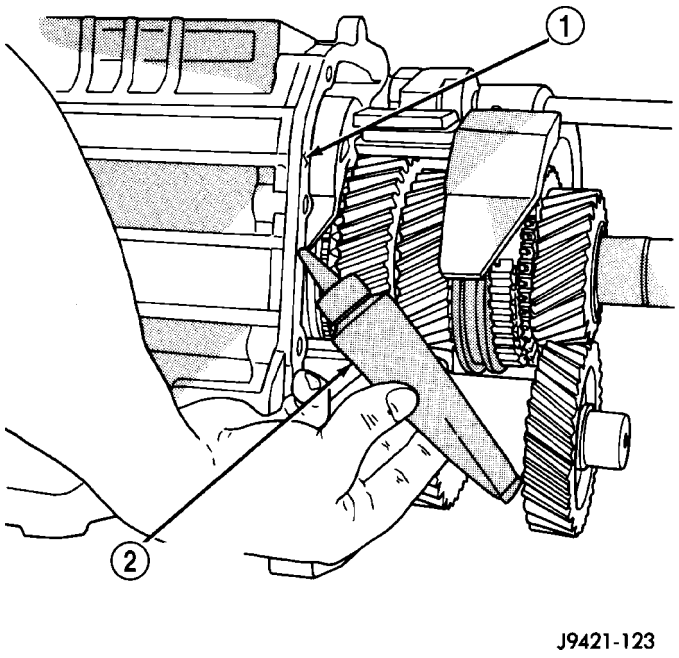

Fig. 115 SEAL HOUSINGS

1 - HOUSING FLANGE SURFACE
2 -GASKET MAKER

(9) Place transmission in horizontal position.

(10) Apply Mopar Gasket Maker or equivalent to housing attaching bolts. Apply sealer material sealer to underside of bolt heads and to bolt shanks and threads (Fig. 116).

(11) Install and start housing attaching bolts by hand (Fig. 116). Then tighten bolts to 34 N·m (25 ft. lbs.).

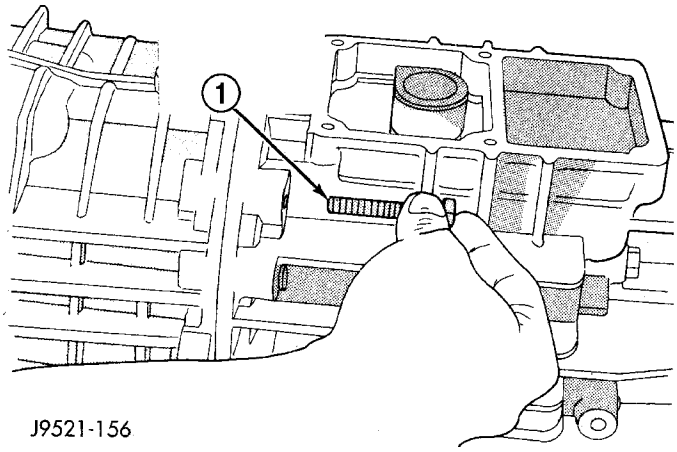

Fig. 116 HOUSING BOLTS

1 - HOUSING BOLTS

MANUAL TRANSMISSION - NV3500 (Continued)

(12) Install shift shaft bushing lock bolt (Fig. 117). Apply Mopar Gasket Maker or equivalent to bolt threads, shank and underside of bolt head before installation.

CAUTION: If lock bolt cannot be fully installed the shift shaft is not in Neutral, or the shaft bushing (or lever) is misaligned.

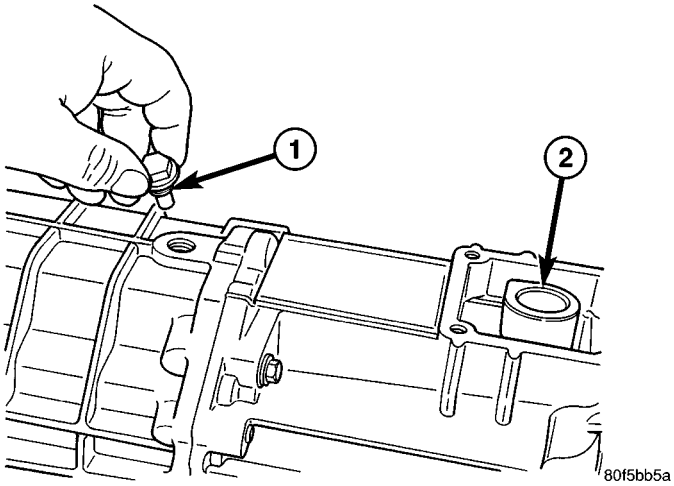

Fig. 117 SHAFT LOCK BOLT

1 - SHIFT SHAFT LOCK BOLT
2 - SHAFT SOCKET

(13) Lubricate then install shift shaft detent plunger in housing bore. Lubricate plunger with semi-synthetic/synthetic grease. Verify plunger is fully seated in detent notch in shift shaft.

(14) Install detent spring inside plunger.

(15) Install detent plug in end of Installer 8123. Position plug on detent spring and compress spring until detent plug pilots in detent plunger bore. Drive detent plug into transmission case until plug seats.

(16) Install backup light switch (Fig. 118).

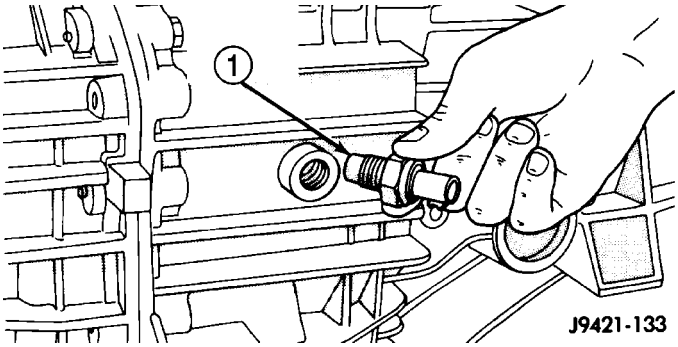

Fig. 118 BACKUP LIGHT SWITCH

1 - BACKUP LIGHT SWITCH

(17) Install input shaft snap ring (Fig. 119).

(18) Install **new** oil seal in front bearing retainer with Installer 6448 (Fig. 120).

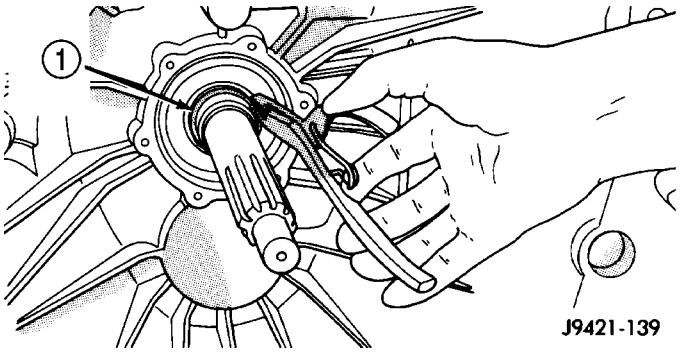

Fig. 119 SHAFT SNAP RING - TYPICAL

1 - INPUT SHAFT SNAP RING

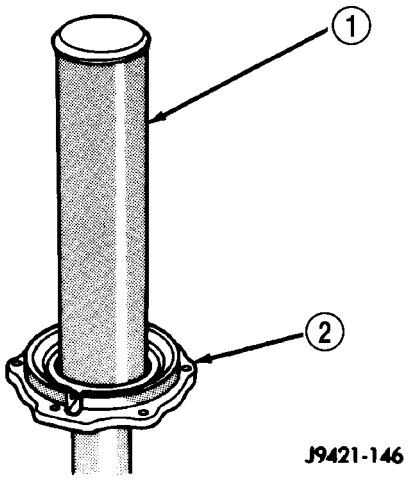

Fig. 120 BEARING RETAINER OIL SEAL

1 - INSTALLER
2 - FRONT BEARING RETAINER

(19) Apply bead of Mopar silicone sealer or equivalent to flange surface of front bearing retainer (Fig. 121).

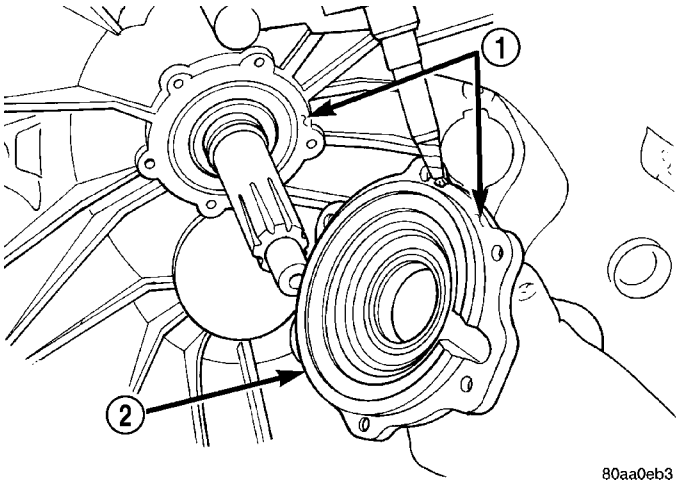

Fig. 121 SEAL BEARING RETAINER - TYPICAL

1 - APPLY SEALER BEAD
2 - INPUT SHAFT BEARING RETAINER

(20) Align and install front bearing retainer over input shaft and onto housing mounting surface (Fig. 122). Verify bolt holes are aligned before seating retainer.

CAUTION: Be sure sealer does not get into the oil feed hole in the transmission case or bearing retainer.

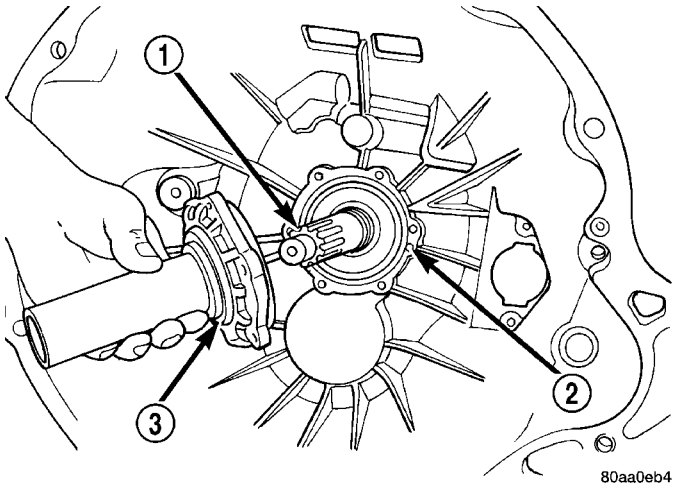

Fig. 122 INPUT SHAFT BEARING RETAINER

1 - INPUT SHAFT
2 - OIL FEED
3 - BEARING RETAINER

(21) Install and tighten bearing retainer bolts to 7-10 N·m (5-7 ft. lbs.) (Fig. 123).

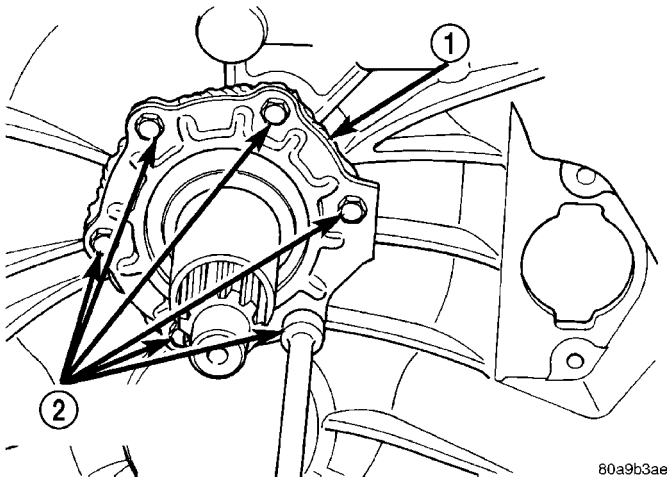

Fig. 123 BEARING RETAINER BOLTS - TYPICAL

1 - RETAINER BOLTS
2 - RETAINER

SHIFT TOWER AND LEVER

(1) Apply petroleum jelly to ball end of shift lever and interior of shift socket.

(2) Shift the transmission into third gear.

(3) Align and install shift tower and lever assembly (Fig. 124). Be sure shift ball is seated in socket and the offset in the tower is toward the passenger side of the vehicle before installing tower bolts.

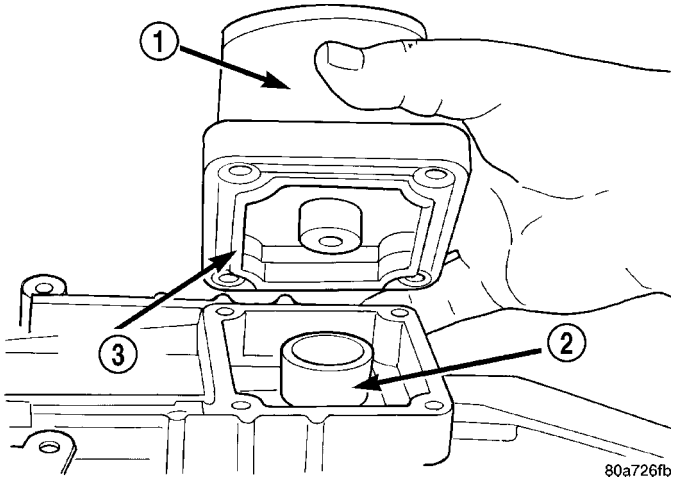

Fig. 124 SHIFT TOWER

1 - SHIFT TOWER
2 - SHAFT SOCKET
3 - SHIFT BALL

(4) Install shift tower bolts (Fig. 125) and tighten bolts to 8.5 N·m (75.2 in. lbs.).

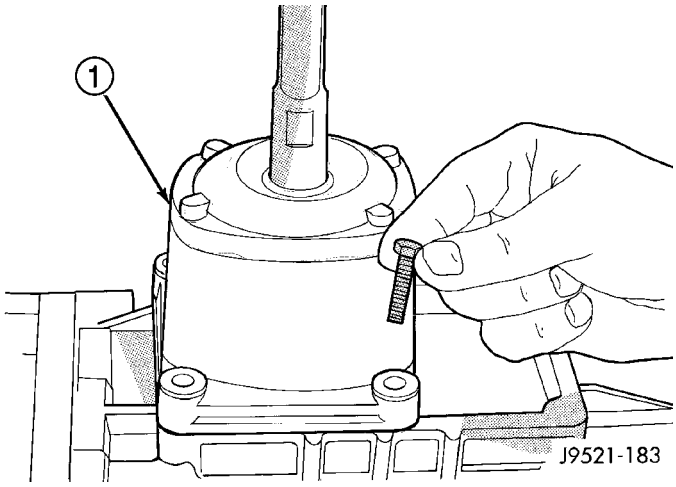

Fig. 125 SHIFT TOWER BOLTS

1 - SHIFT TOWER AND LEVER ASSEMBLY

(5) Fill transmission to bottom edge of fill plug hole with lubricant.

(6) Install and tighten fill plug to 34 N·m (25 ft. lbs.).

(7) Check transmission vent. Be sure vent is open and not restricted.

MANUAL TRANSMISSION - NV3500 (Continued)

INSTALLATION

NOTE: If a new transmission is being installed, use all components supplied with the new transmission. For example, if a new shift tower is supplied, do not re-use the original shift tower.

(1) Clean transmission front housing mounting surface.

(2) Apply light coat of Mopar high temperature bearing grease or equivalent to contact surfaces (Fig. 126) of following components:

- release fork ball stud.
- release bearing slide surface.
- input shaft splines.
- release bearing bore.
- propeller shaft slip yoke.

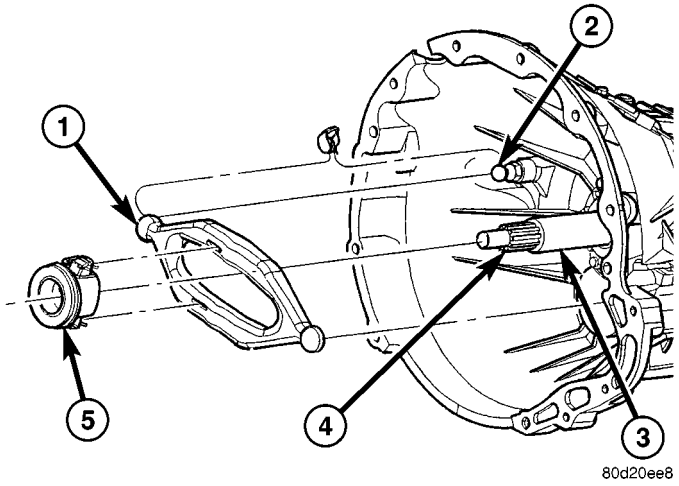

Fig. 126 LUBRICATION POINTS

1 - RELEASE FORK
2 - FORK BALL STUD
3 - BEARING SLIDE SURFACE
4 - SPLINE
5 - RELEASE BEAING

(3) Support and secure transmission to jack.

(4) Raise and align transmission input shaft with clutch disc, then slide transmission into place.

(5) Verify front housing is fully seated. Install transmission bolts without washers and tighten bolts into the engine to 41 N·m (30 ft. lbs.). Tighten the bolts with washers into the transmission to 68 N·m (50 ft. lbs.) (Fig. 127).

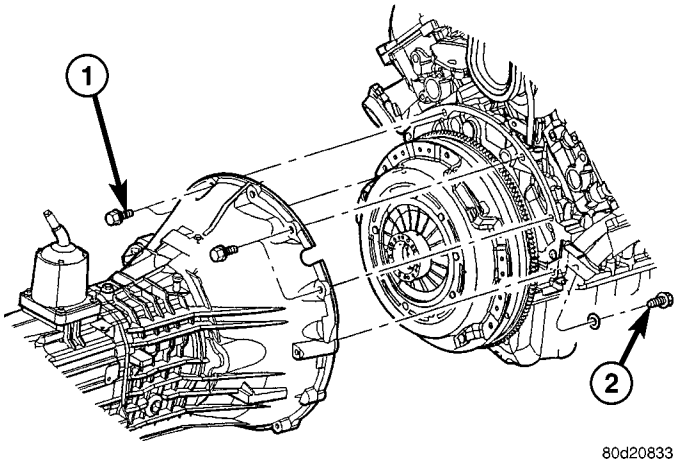

Fig. 127 TRANSMISSION

1 - BOLT WITHOUT WASHER
2 - BOLT WITH WASHER

(6) Install rear crossmember and tighten nuts to 102 N·m (75 ft. lbs.).

(7) Install transmission rear mounting bolts and tighten to 68 N·m (50 ft. lbs.).

(8) Install front dust shield tighten bolt to 4.5 N·m (40 in. lbs.). If cover was removed, install onto the transmission and engine(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

(9) Install structural dust cover and tighten the bolts to 54 N·m (40 ft. lbs.).

(10) Install starter motor.

(11) Install suspension crossmember and tighten nuts to 102 N·m (75 ft. lbs.).

(12) Connect transmission harnesses to clips on case and connect switches.

(13) Install slave cylinder and tighten cylinder nuts to 23 N·m (200 in. lbs.).

(14) Install transfer case and transfer case linkage if equipped.

(15) Remove transmission jack.

(16) Install propeller shaft/shafts with reference marks aligned.

(17) Install exhaust on the exhaust manifolds.

(18) Fill transmission with lubricant. Correct fill level is to bottom edge of fill plug hole.

MANUAL TRANSMISSION - NV4500

DESCRIPTION

The NV4500 is a five speed constant mesh manual transmission. All gear ranges including reverse are synchronized. Fifth gear is an overdrive range. The transmission has a cast iron gear case and aluminum shift cover.

Two versions are used, a standard duty for 5.7L applications and a heavy duty for V10 and Cummins diesel applications. Main difference is a larger diameter input shaft, for the heavy duty model.

Tapered roller bearings support the drive gear, mainshaft and countershaft in the gear case. Roller bearings in the drive gear support the forward end of the mainshaft. The mainshaft gears are all supported on caged type roller bearings. Drive gear thrust reaction is controlled by a needle type thrust bearing. The bearing is located at the forward end of the mainshaft.

The transmission is a top loader style. The shift lever is located in a shifter tower which is bolted to the shift cover and operates the shift forks and rails directly. The shift forks and rails are all located within the aluminum cover which is bolted to the top of the gear case.

IDENTIFICATION

The transmission identification tag is attached to the driver side PTO cover (Fig. 1).

The tag provides the transmission model number, build date and part number. Be sure to reinstall the I.D. tag if removed during service. The information on the tag is essential to correct parts ordering.

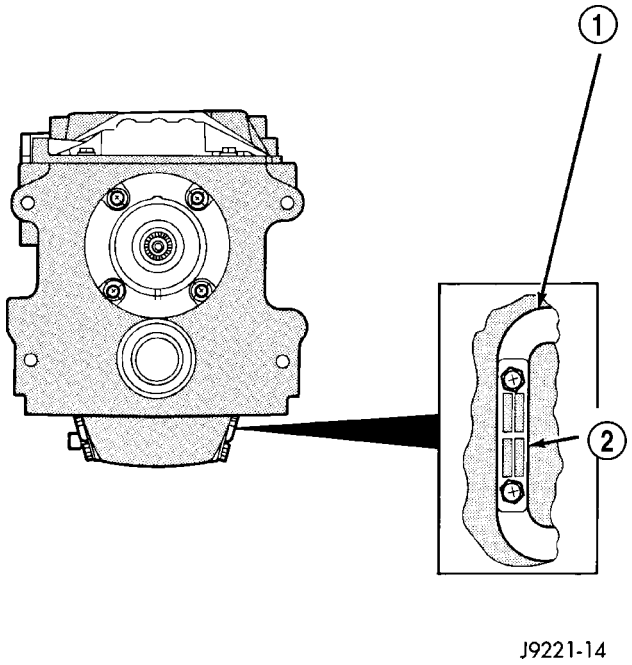

Fig. 1 IDENTIFICATION TAG LOCATION

1 - PTO COVER
2 - I.D. TAG

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point all the transmission gears are spinning.

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether the driver is up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

DIAGNOSIS AND TESTING

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check. A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition. Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer. A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds. Severe highly audible transmission noise is generally the initial indicator of a lubricant problem.

Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL

(1) Shift transmission into Neutral.

(2) Remove shift boot screws from floorpan and slide boot upward on the shift lever.

(3) Remove shift lever extension from shift tower and lever assembly.

(4) Remove shift tower bolts (Fig. 2).

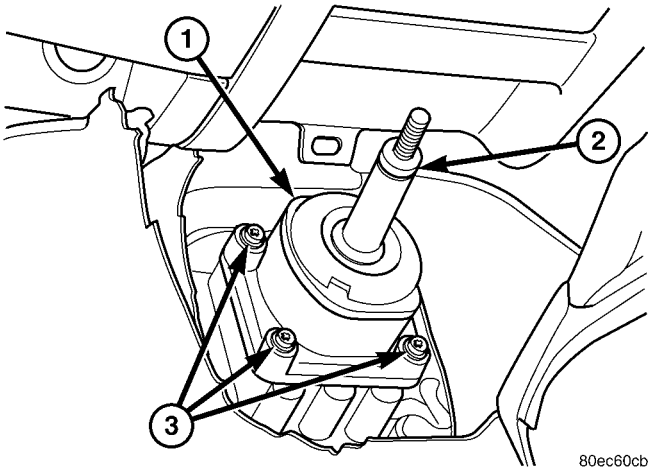

Fig. 2 SHIFT TOWER

1 - SHIFT TOWER
2 - SHIFTER
3 - BOLTS

MANUAL TRANSMISSION - NV4500 (Continued)

(5) Remove shift tower and isolator plate from transmission shift cover.
(6) Raise and support vehicle.
(7) Remove skid plate, if equipped.
(8) Mark propeller shaft and axle yokes for installation reference and remove shaft/shafts.
(9) Remove exhaust system Y-pipe.
(10) Disconnect speed sensor and backup light switch connectors.
(11) Support engine with safety stand and a wood block.
(12) If transmission is to be disassembled, remove drain bolt at bottom of PTO cover and drain lubricant (Fig. 3).

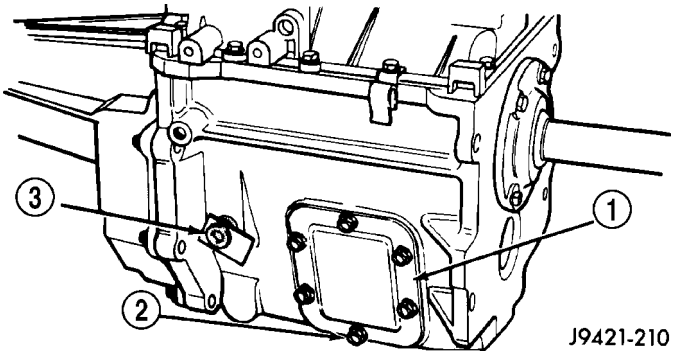

Fig. 3 FILL AND DRAIN PLUGS

1 - PTO COVER
2 - DRAIN BOLT
3 - FILL PLUG

TWO WHEEL DRIVE

(1) Remove bolts attaching transmission to rear crossmember mount.
(2) Support and secure transmission with safety chains to a transmission jack.
(3) Remove rear crossmember bolts and pry out crossmenber.
(4) Remove clutch slave cylinder bolts and move cylinder aside for clearance.

NOTE: The hydraulic linkage has a quick connect at the slave cylinder. This fitting should not be disconnected.

(5) Remove transmission harness wires from clips on transmission shift cover.
(6) Remove transmission to clutch housing bolts.
(7) Slide transmission and jack rearward until input shaft clears clutch housing.
(8) Lower transmission jack and remove transmission from under vehicle.

FOUR WHEEL DRIVE

(1) Disconnect transfer case shift linkage at transfer case range lever. Then remove transfer case shift mechanism from transmission (Fig. 4).

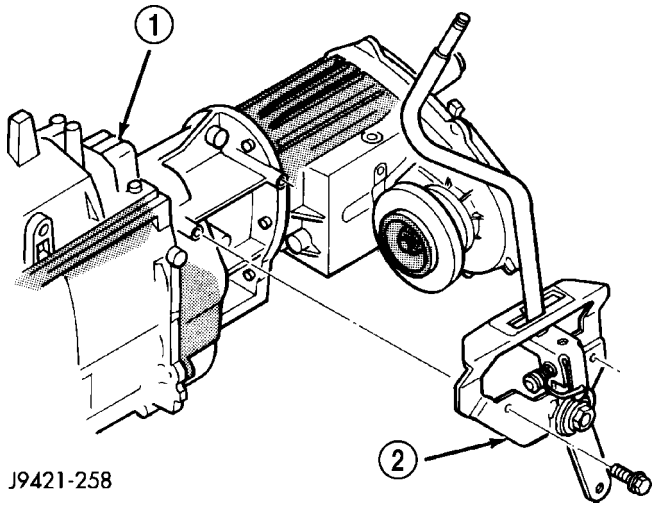

Fig. 4 TRANSFER CASE SHIFTER-TYPICAL

1 - TRANSMISSION
2 - TRANSFER CASE SHIFT MECHANISM

(2) Support and secure transfer case to transmission jack with safety chains.
(3) Remove transfer case mounting nuts.
(4) Move transfer case rearward until input gear clears transmission mainshaft.
(5) Lower transfer case assembly and move it from under vehicle.
(6) Support and secure transmission with safety chains to a transmission jack.
(7) Remove transmission harness from retaining clips on transmission shift cover.
(8) Remove bolts/nuts attaching transmission mount to rear crossmember.
(9) Remove rear crossmember bolts and pry out crossmenber.
(10) Remove clutch slave cylinder splash shield, if equipped.
(11) Remove clutch slave cylinder bolts and move cylinder aside for clearance.

NOTE: The hydraulic linkage has a quick connect at the slave cylinder. This fitting should not be disconnected.

(12) Remove transmission to clutch housing bolts.
(13) Slide transmission and jack rearward until input shaft clears clutch housing.
(14) Lower transmission jack and remove transmission from under vehicle.

DISASSEMBLY

SHIFT MECHANISM

(1) Remove bolts holding shift tower to shift mechanism cover and remove tower.

(2) Remove bolts holding shift mechanism cover to transmission.

(3) Pry up shift mechanism cover at slot (Fig. 5) in cover.

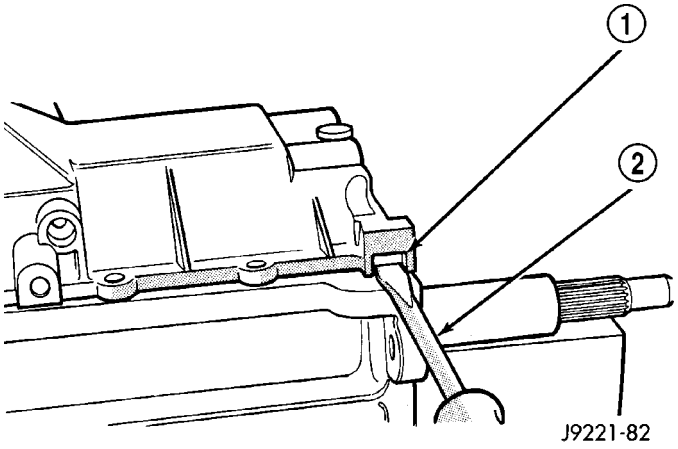

Fig. 5 LOOSEN SHIFT MECHANISM

1 - SHIFT MECHANISM COVER SLOT
2 - PRY TOOL

(4) Raise mechanism up enough to disengage it from the dowl pins (Fig. 6).

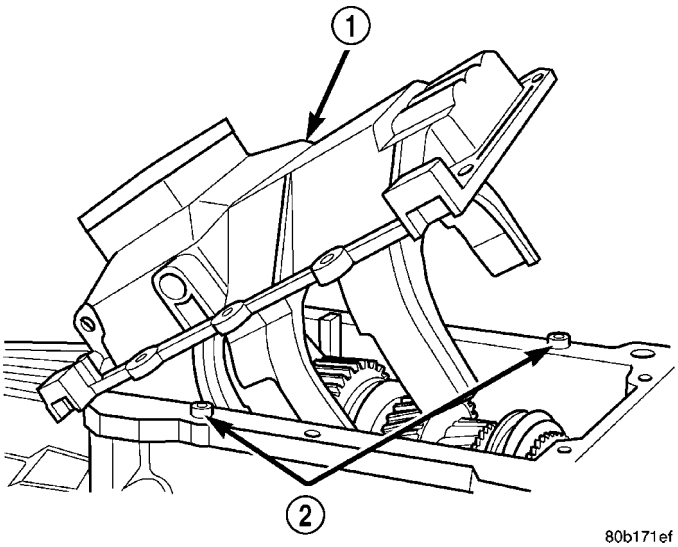

Fig. 6 SHIFT MECHANISM COVER

1 - SHIFT MECHANISM COVER
2 - ALIGNMENT DOWELS

(5) Raise front of the mechanism and lift up and off the transmission.

EXTENSION/ADAPTER HOUSING

(1) Remove bolts attaching extension/adapter housing to gear case (Fig. 7).

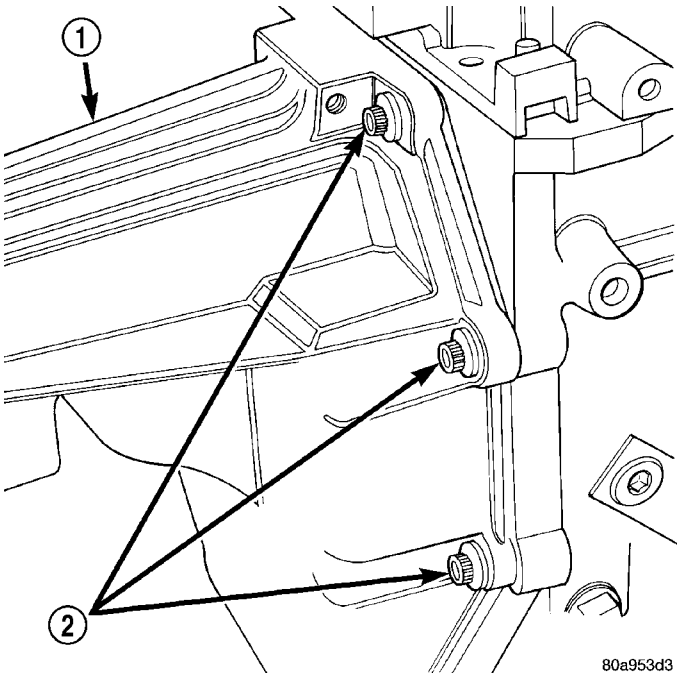

Fig. 7 EXTENSION/ADAPTER HOUSING BOLTS

1 - EXTENSION HOUSING
2 - BOLTS (8)

(2) Remove extension/adapter housing (Fig. 8). There is one alignment dowel in the gear case and one in the extension/adapter housing.

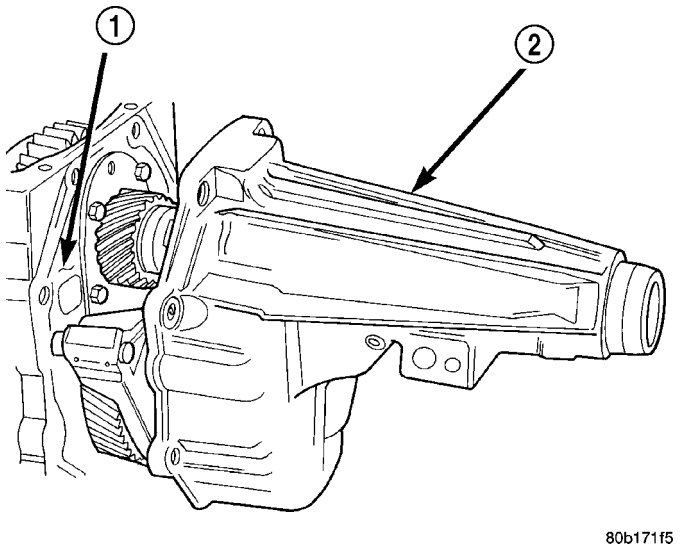

Fig. 8 EXTENSION/ADAPTER HOUSING

1 - GEAR CASE
2 - EXTENSION HOUSING

(3) Remove rubber spline seal from end of mainshaft (Fig. 9). The seal is used to prevent lubricant loss during shipping and does not have to be replaced if damaged.

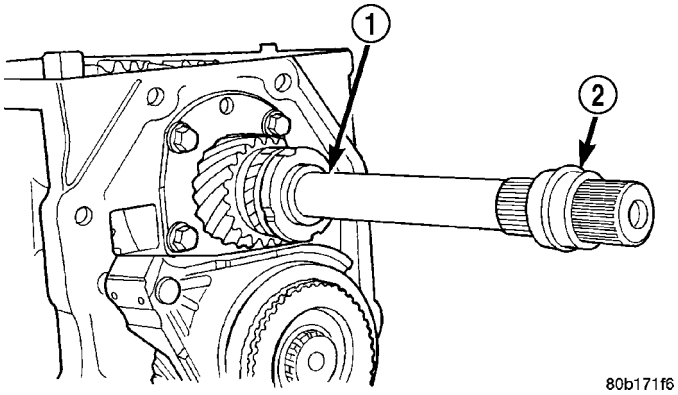

Fig. 9 MAINSHAFT SPLINE SEAL

1 - MAINSHAFT
2 - RUBBER SPLINE SEAL

FIFTH GEAR NUT

(1) Remove extension/adapter housing.
(2) Loosen fifth gear clamp nut clamping screw approximately 1 1/2 turns.
(3) Install Wrench 6743 on fifth gear nut (Fig. 10).

NOTE: Wrench only fits one way on nut. Make sure wrench is fully engaged in nut slots and is not cocked.

(4) Install Socket 6993 4X2 or Socket 6984 4X4 with breaker bar to hold mainshaft and remove fifth gear nut.

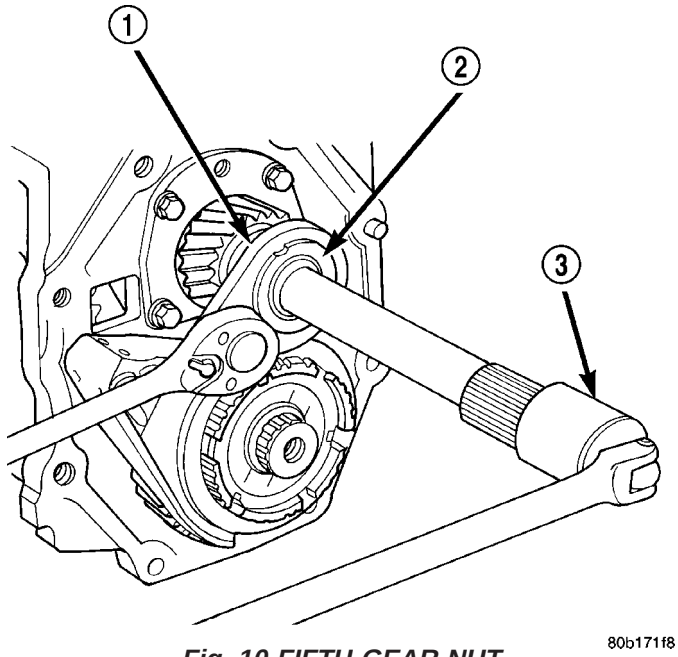

Fig. 10 FIFTH GEAR NUT

1 - WRENCH
2 - FIFTH GEAR NUT
3 - SPLINE SOCKET

NOTE: Wedge breaker bar handle against workbench. Purpose of socket wrench and breaker bar is to prevent mainshaft from turning while nut is loosened.

(5) Remove fifth gear nut, then remove belleville washer from mainshaft.

FIFTH GEAR

(1) Remove fifth gear shift fork roll pins (Fig. 11). Drive roll pins out from the bottom of fork.

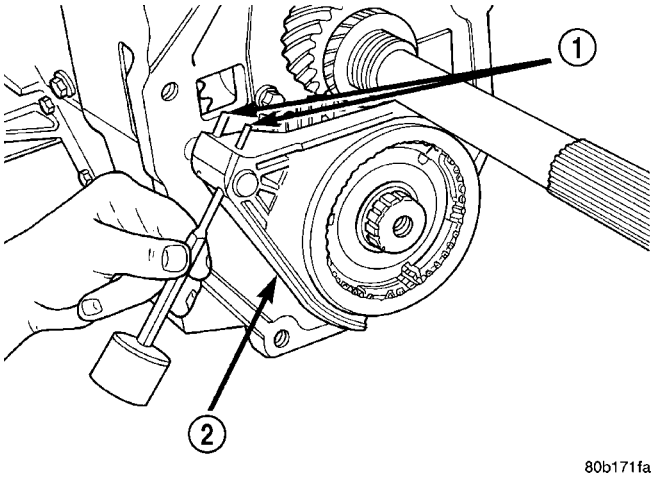

Fig. 11 FIFTH GEAR SHIFT FORK ROLL PINS

1 - ROLL PINS
2 - FIFTH GEAR SHIFT FORK

(2) Remove fifth gear clutch hub and gear snap ring from countershaft (Fig. 12).
(3) Remove countershaft fifth gear clutch gear and stop ring.
(4) Tap off fifth gear shift fork and gear assembly off rail with plastic mallet.
(5) Remove fifth gear shift fork from sleeve.
(6) Remove sleeve, struts and strut springs from countershaft fifth gear hub, if necessary.

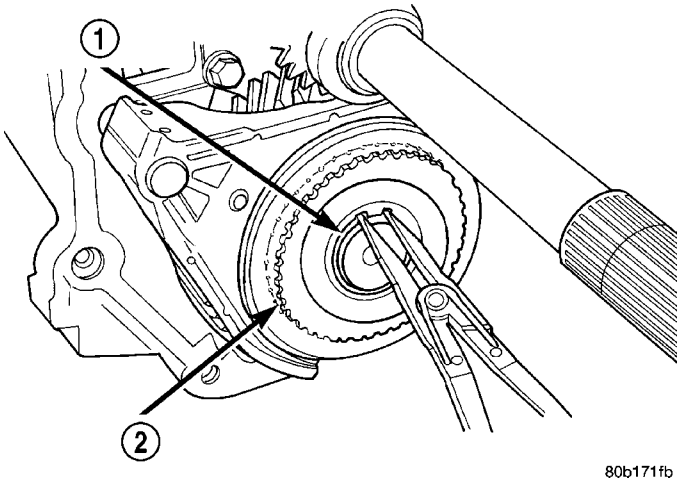

Fig. 12 FIFTH GEAR CLUTCH GEAR SNAP RING

1 - CLUTCH GEAR RING
2 - FIFTH SYNCHRO CLUTCH GEAR

(7) Remove countershaft fifth gear needle bearing assembly (Fig. 13).

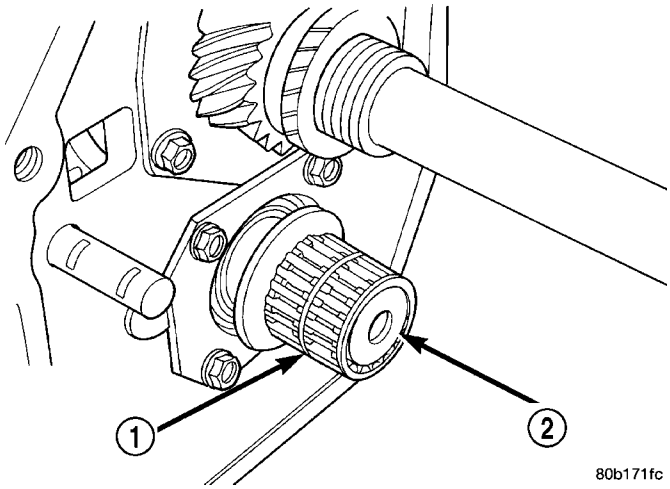

Fig. 13 COUNTERSHAFT FIFTH GEAR NEEDLE BEARING

1 - NEEDLE BEARING
2 - COUNTERSHAFT

(8) Remove coned shape rear bearing thrust washer from countershaft (Fig. 14).

NOTE: Note washer bore locating notch for assembly reference.

(9) Remove thrust washer locating pin from countershaft.

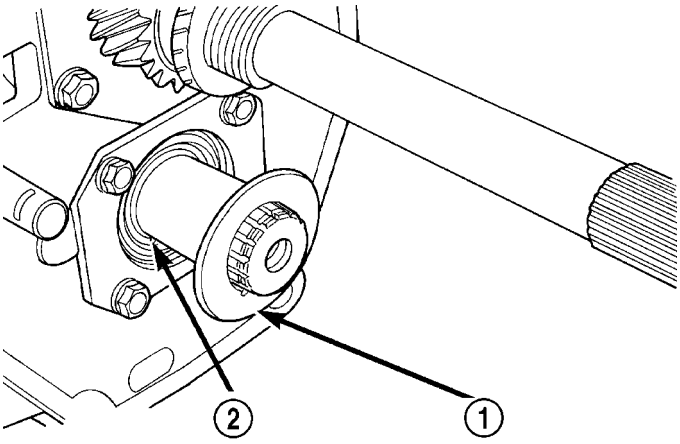

Fig. 14 COUNTERSHAFT REAR BEARING THRUST WASHER

1 - THRUST WASHER
2 - THRUST WASHER PIN

(10) Remove mainshaft fifth gear with Puller Set 6444 and Jaw 6459 or 6820. Position first Jaw on gear (Fig. 15).

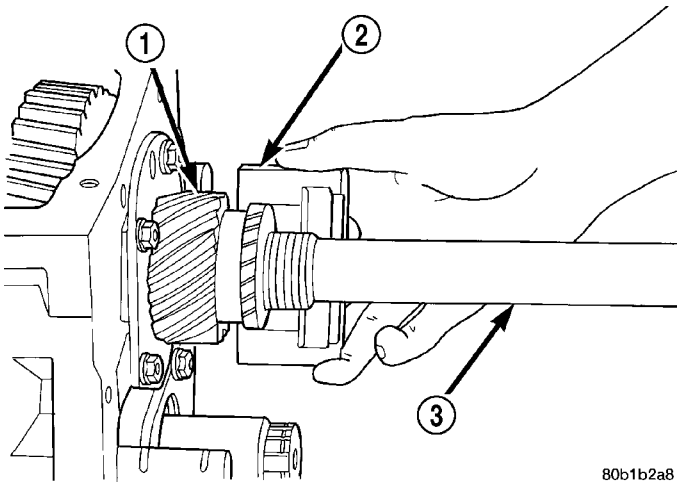

Fig. 15 JAW ON MAINSHAFT FIFTH GEAR

1 - MAINSHAFT FIFTH GEAR
2 - JAW
3 - MAINSHAFT

(11) Assemble Puller Flange 6444-1and Puller Rods 6444-3 4X2 or 6444-4 4X4 (Fig. 16). Slide assembly onto output shaft and seat flange in notch of jaw.

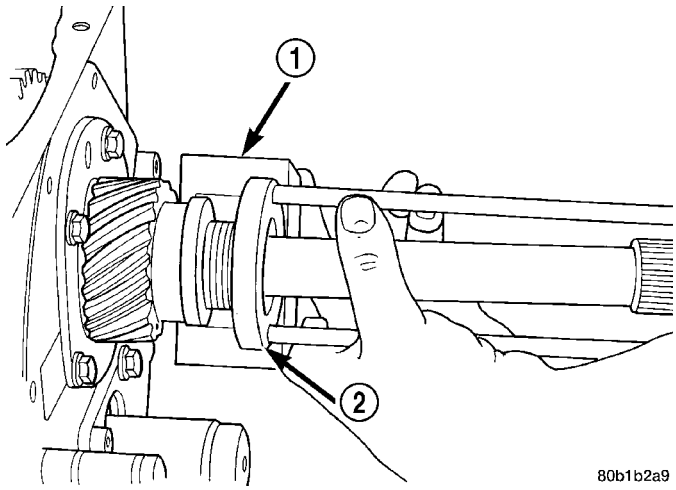

Fig. 16 PULLER FLANGE

1 - JAW
2 - PULLER FLANGE

MANUAL TRANSMISSION - NV4500 (Continued)

(12) Position second puller jaw on gear and in notch of puller flange (Fig. 17). Slide Collar 6444-8 over puller jaws to hold them in place.

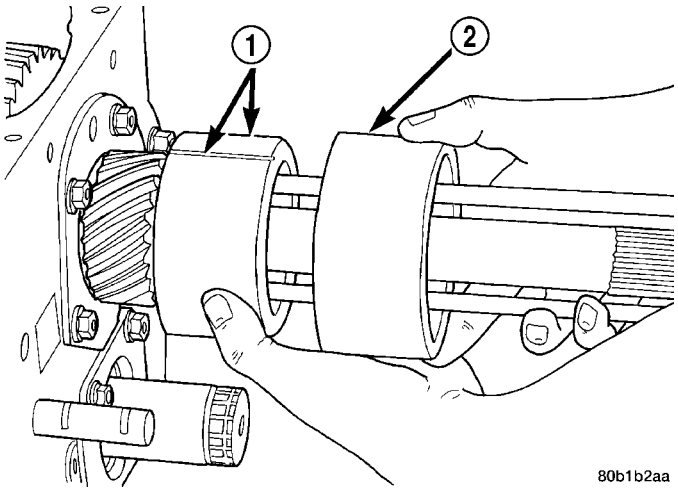

Fig. 17 PULLER COLLAR

1 - JAWS
2 - COLLAR

(13) Install Puller and Bolt 6444 on puller rods and secure puller to rods with retaining nuts (Fig. 18). Tighten puller bolt to remove gear from shaft splines.

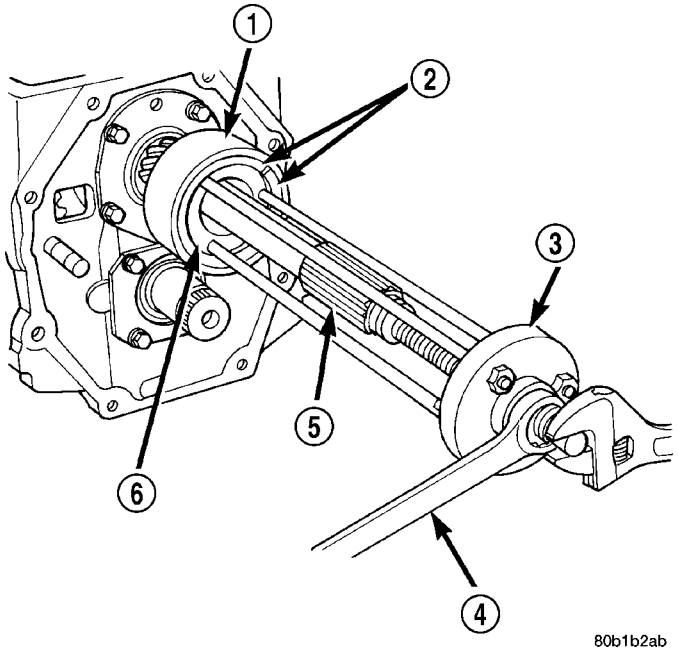

Fig. 18 PULLER ASSEMBLY

1 - COLLAR
2 - JAWS
3 - BOLT
4 - WRENCH
5 - MAINSHAFT
6 - PULLER FLANGE

(14) Remove mainshaft rear bearing plate bolts and remove fifth gear plate end play shims and bearing cup (Fig. 19).

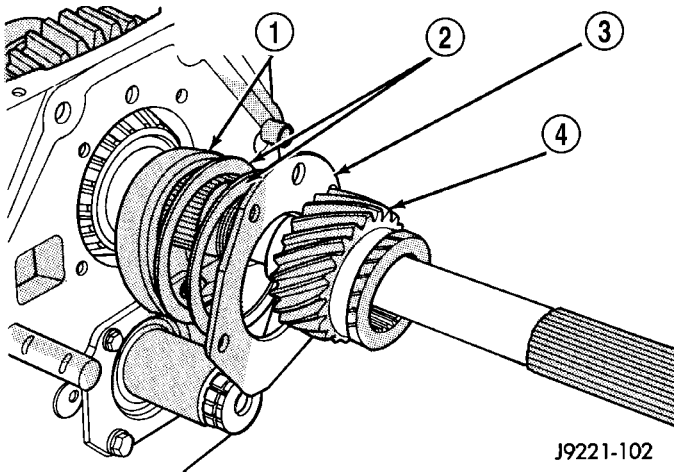

Fig. 19 FIFTH GEAR BEARING PLATE, SHIMS AND BEARING CUP

1 - MAINSHAFT REAR BEARING CUP
2 - BEARING SHIMS
3 - BEARING PLATE
4 - FIFTH GEAR

FRONT RETAINER

(1) Remove and discard front bearing retainer bolts (Fig. 20).

CAUTION: Do not reuse retainer bolts.

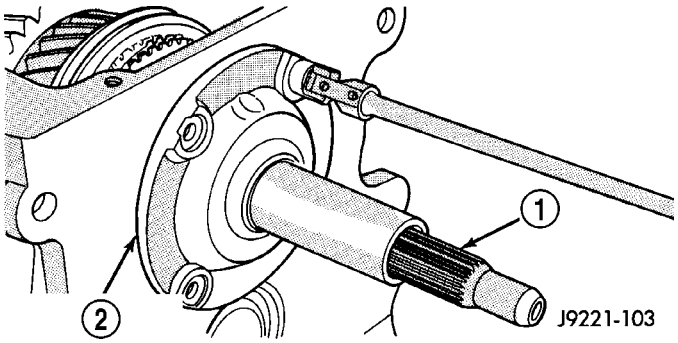

Fig. 20 FRONT BEARING RETAINER

1 - DRIVE GEAR
2 - FRONT BEARING RETAINER

(2) Lightly tap retainer back and forth with plastic mallet to work it out of gear case.

NOTE: Retainer flange extends into transmission case and is a snug fit.

MANUAL TRANSMISSION - NV4500 (Continued)

(3) Remove front retainer seal by (Fig. 21) collapsing one side of seal then prying it out.

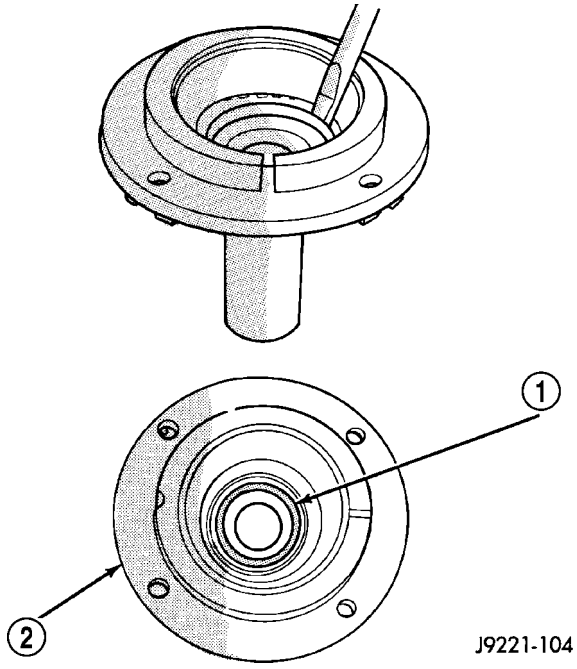

Fig. 21 BEARING RETAINER SEAL

1 - SEAL
2 - FRONT BEARING RETAINER

(4) Remove front retainer bearing cup with Puller 6444. Assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 22). Insert Jaws 6453-1 in puller flange. Narrow lip of puller jaws will go under bearing cup.

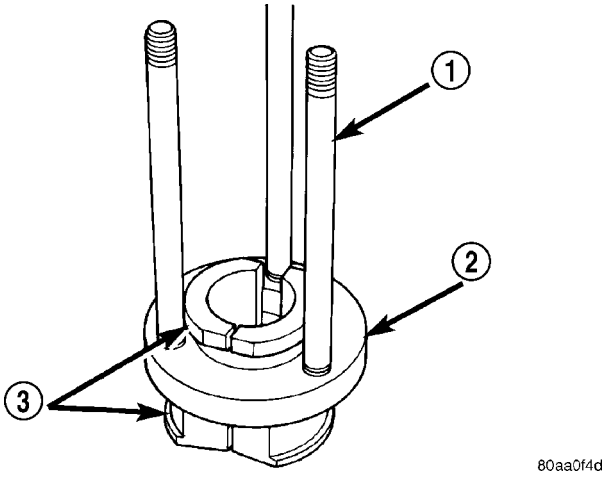

Fig. 22 PULLER RODS, FLANGE AND JAWS

1 - RODS
2 - FLANGE
3 - JAWS

(5) Install Disc C-4487-1 into bearing retainer for Insert 6453-2 to rest upon.

(6) Install assembled tools in front retainer (Fig. 23) with puller jaws seated under bearing cup. Place Insert 6453-2 in center of puller jaws, to hold puller jaws in place.

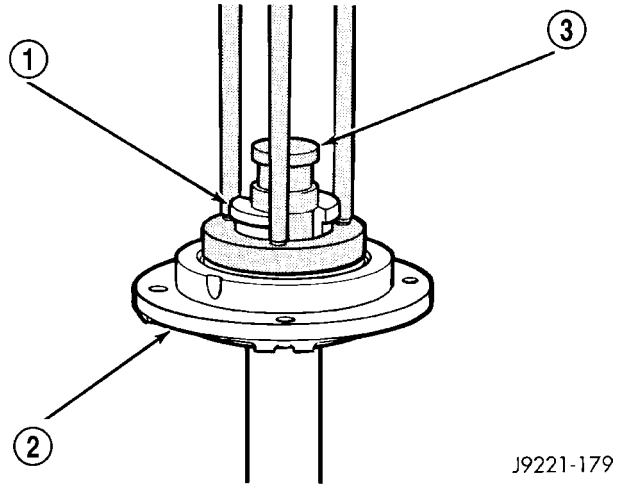

Fig. 23 INSERT AND RETAINER

1 - INSERT
2 - FRONT RETAINER
3 - JAWS

(7) Install Puller 6444 on puller rods (Fig. 24) and install retaining nuts on puller rods. Tighten puller bolt to draw bearing cup out of retainer.

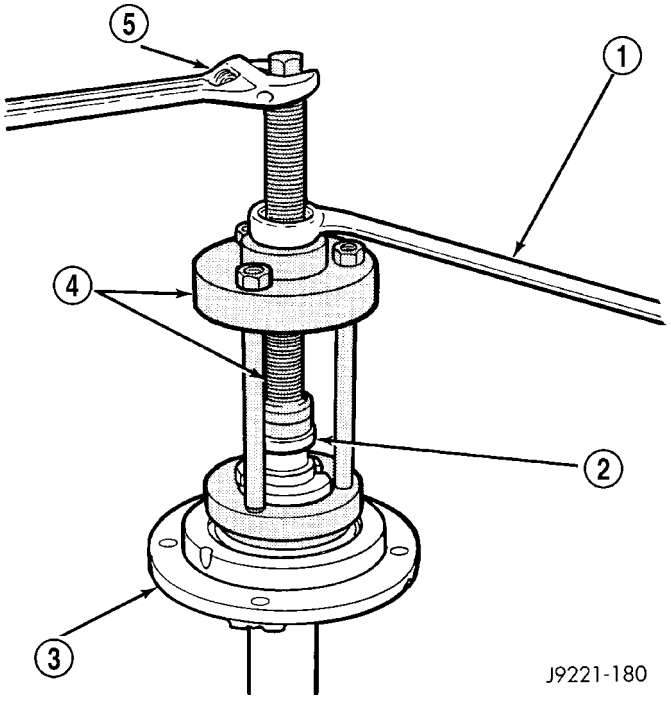

Fig. 24 BEARING CUP PULLER ASSEMBLY

1 - WRENCH
2 - INSERT
3 - FRONT RETAINER
4 - PULLER
5 - WRENCH

MANUAL TRANSMISSION - NV4500 (Continued)

DRIVE GEAR

(1) Remove drive gear (Fig. 25).

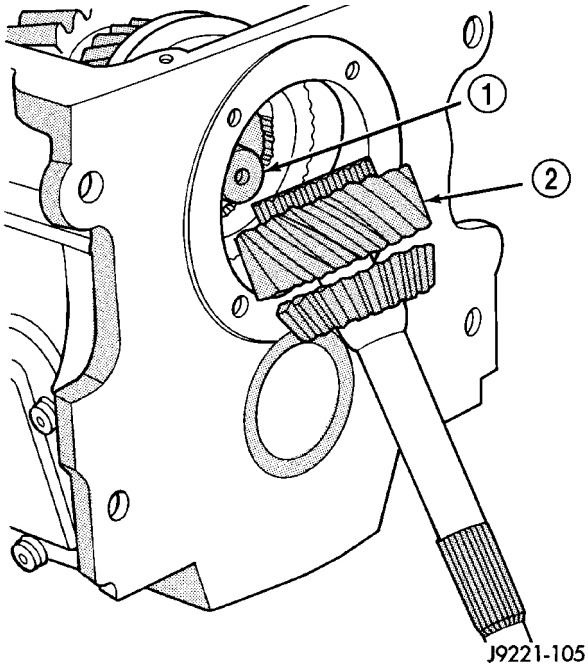

Fig. 25 DRIVE GEAR

1 - MAINSHAFT
2 - DRIVE GEAR

(2) Remove pilot bearing from drive gear (Fig. 26).

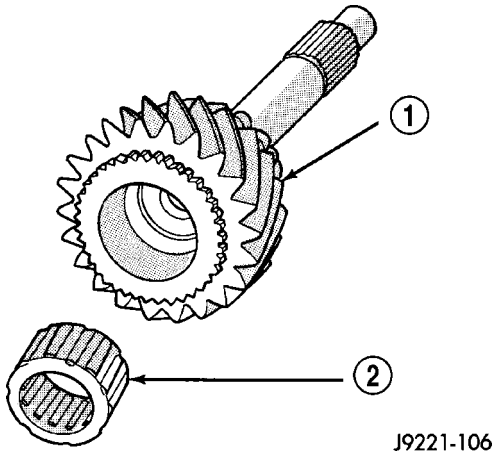

Fig. 26 PILOT BEARING

1 - DRIVE GEAR
2 - MAINSHAFT PILOT BEARING

(3) Remove tapered bearing from drive gear with Puller Flange 6444-1 and Puller Rods 6444-6 (Fig. 27).

(4) Position first Jaw 6447 on bearing. Slide assembled puller flange and rod tools onto input shaft. Then seat flange in notch of puller jaw.

(5) Position second Jaw 6447 on gear and in notch of puller flange. Slide Collar 6444-8 over puller jaws to hold them in place.

(6) Install Puller 6444 on puller rods then install retaining nuts. Tighten puller bolt to remove bearing cone from drive gear.

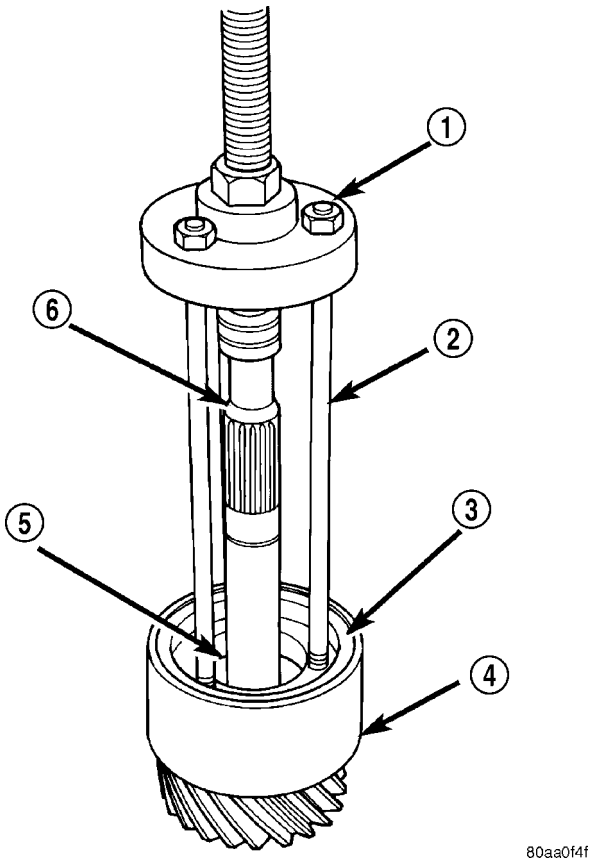

Fig. 27 FRONT BEARING PULLER

1 - PULLER
2 - RODS
3 - JAWS
4 - COLLAR
5 - FLANGE
6 - DRIVE GEAR

MANUAL TRANSMISSION - NV4500 (Continued)

MAINSHAFT AND GEARTRAIN

(1) Move 1-2 and 3-4 synchro sleeves into neutral.
(2) Remove drive gear thrust bearing from forward end of mainshaft (Fig. 28).

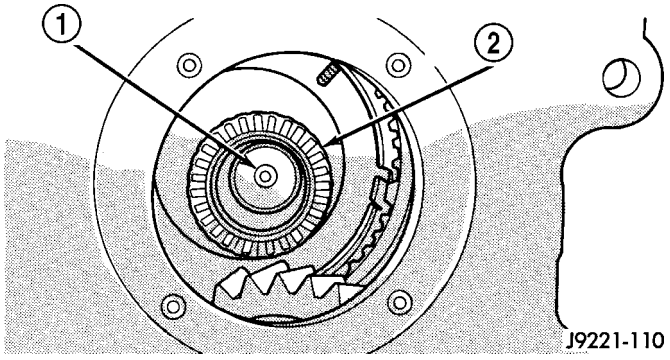

Fig. 28 DRIVE GEAR THRUST BEARING

1 - MAINSHAFT
2 - DRIVE GEAR THRUST BEARING

(3) Remove fourth gear clutch gear and synchro stop ring from mainshaft (Fig. 29).

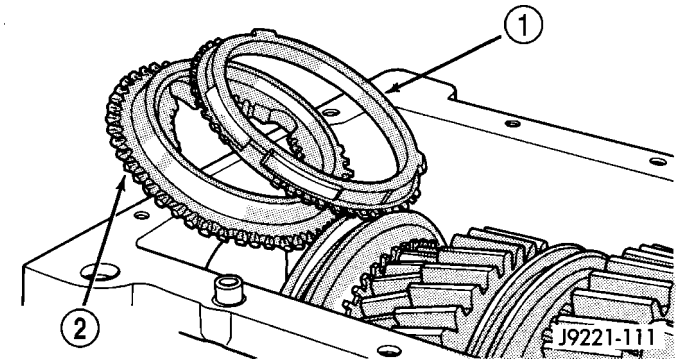

Fig. 29 FOURTH GEAR CLUTCH GEAR STOP RING

1 - FOURTH GEAR SYNCHRO STOP RING
2 - FOURTH SPEED CLUTCH GEAR

(4) Roll gear case onto left side.
(5) Remove mainshaft assembly (Fig. 30) by lifting front end of mainshaft slightly. Then grasp mainshaft rear splines and turn spline end of mainshaft counterclockwise to rotate shaft and geartrain out of case. Tilt mainshaft outward and removed from case.

NOTE: Handling mainshaft carefully because gears are lose on the mainshaft.

REVERSE IDLER AND COUNTERSHAFT

(1) Remove countershaft rear bearing plate (Fig. 31).
(2) Remove countershaft end play shim and rear bearing cup (Fig. 32).

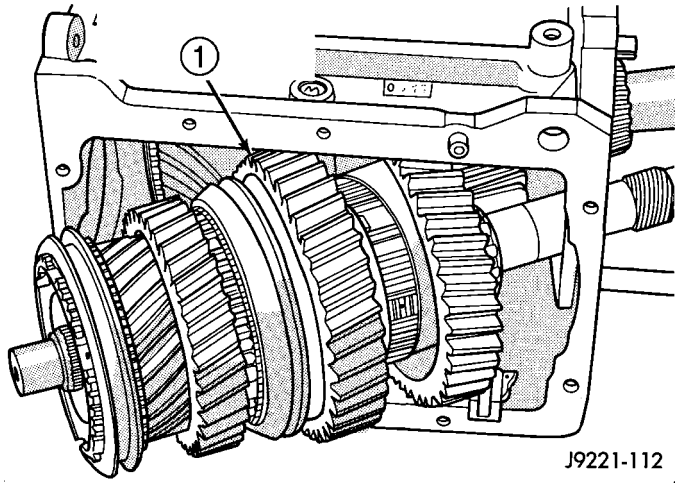

Fig. 30 MAINSHAFT AND GEARTRAIN

1 - MAINSHAFT AND CASE

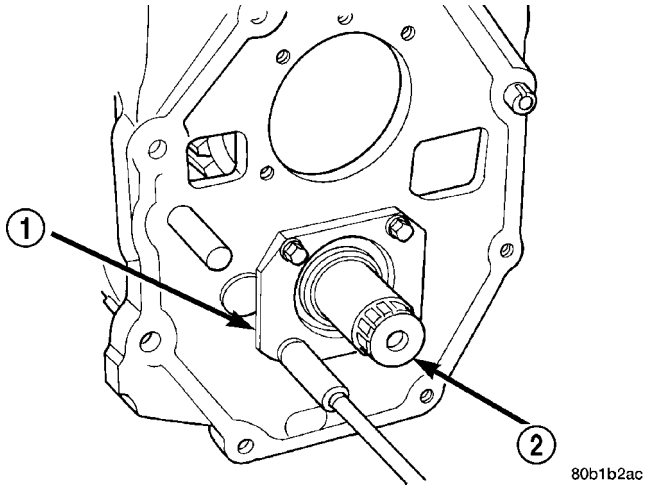

Fig. 31 COUNTERSHAFT REAR BEARING PLATE

1 - REAR BEARING PLATE
2 - COUNTERSHAFT

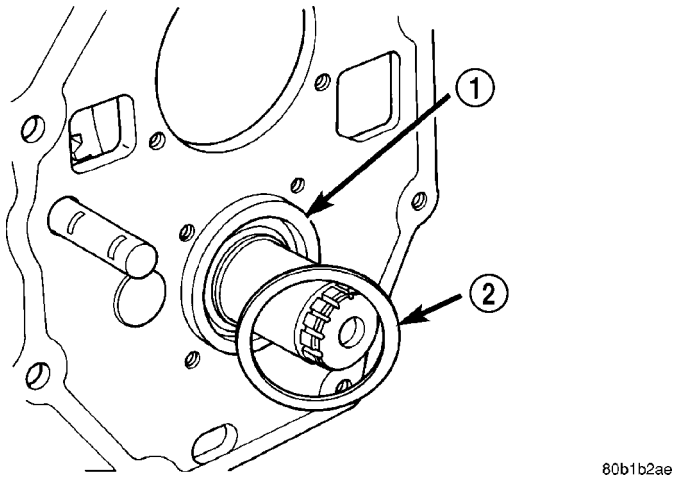

Fig. 32 END PLAY SHIM AND REAR BEARING CUP

1 - COUNTERSHAFT REAR BEARING CUP
2 - END PLAY SHIM

MANUAL TRANSMISSION - NV4500 (Continued)

(3) Remove reverse idler shaft (Fig. 33).

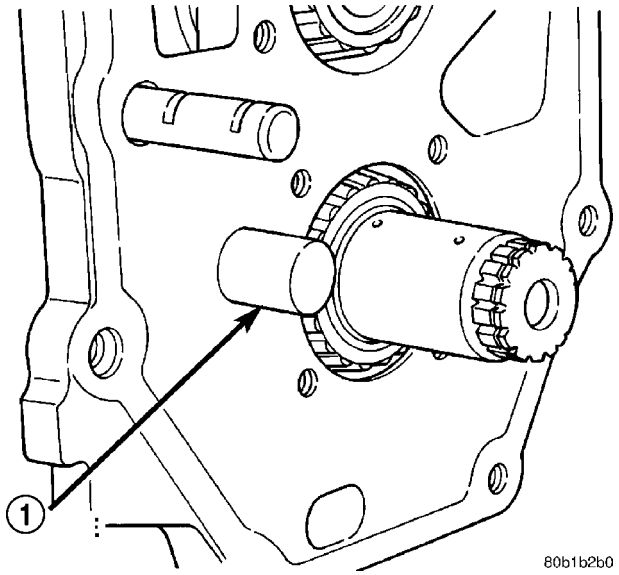

Fig. 33 REVERSE IDLER SHAFT

1 - REVERSE IDLER SHAFT

(4) Rotate countershaft outward and push reverse idler gear away from countershaft and toward front of case (Fig. 34).

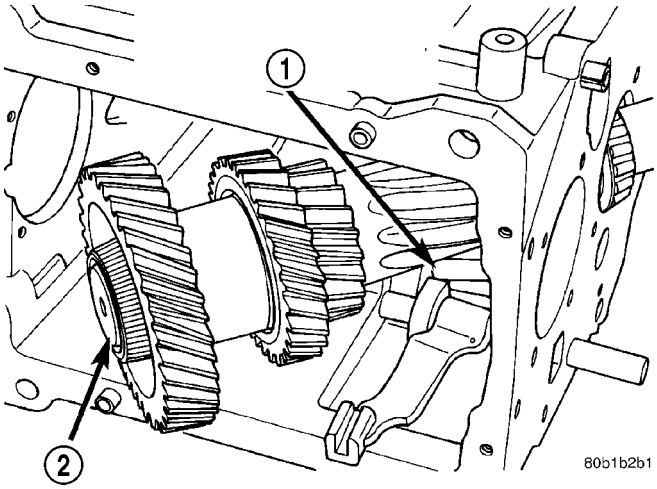

Fig. 34 IDLER GEAR AND COUNTERSHAFT

1 - REVERSE IDLER GEAR
2 - COUNTERSHAFT

(5) Remove idler gear (Fig. 35).

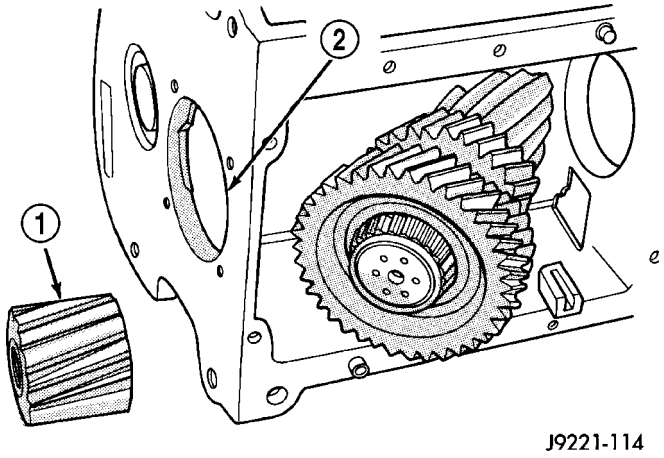

Fig. 35 REVERSE IDLER GEAR

1 - REVERSE IDLER GEAR
2 - DRIVE GEAR BORE

(6) Keep reverse idler gear bearings and spacer together (Fig. 36). Insert idler shaft through gear and bearings to keep them in place.

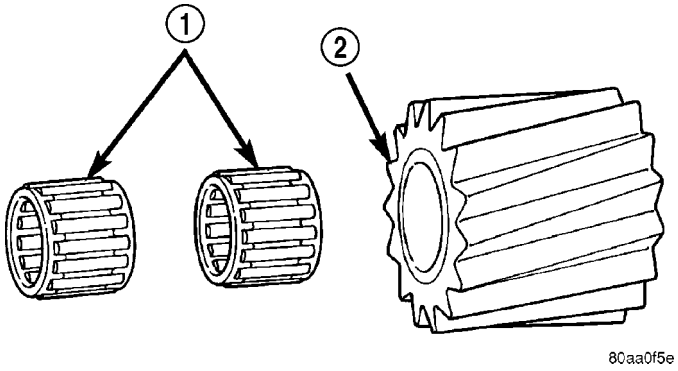

Fig. 36 IDLER GEAR COMPONENTS

1 - BEARINGS
2 - REVERSE IDLER GEAR

(7) Remove idler gear thrust washers from gear case. Install washers on idler shaft to keep them together for cleaning and inspection.

MANUAL TRANSMISSION - NV4500 (Continued)

(8) Remove countershaft rear bearing with Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 37).

NOTE: Shaft cannot be removed from case until rear bearing has been removed.

(9) Position first Jaw 6449 on bearing cone and seat puller flange in notch of puller.

(10) Install second Jaw 6449 on bearing and in notch of puller flange. Slide Collar 6444-8 over puller jaws to hold them in place.

NOTE: Retaining collar has small lip on one end and only fits one way over jaws.

(11) Install Puller 6444 on puller rods, then secure puller to rods with retaining nuts.Tighten puller bolt to remove bearing from shaft.

NOTE: If bearing is exceptionally tight, tap end of puller bolt with copper mallet to help loosen bearing.

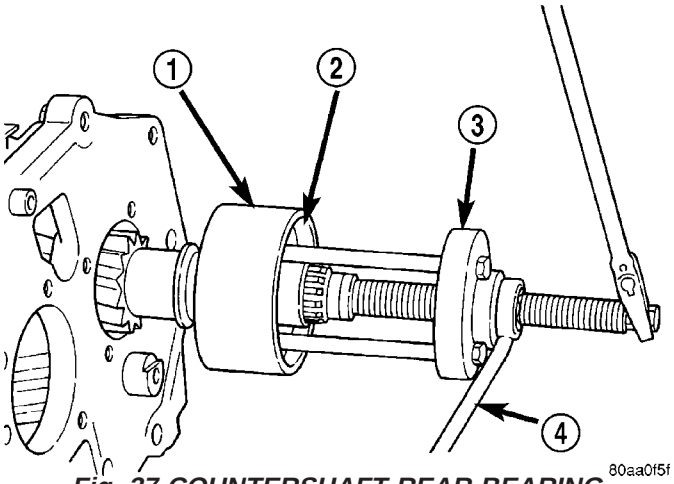

Fig. 37 COUNTERSHAFT REAR BEARING

1 - COLLAR
2 - JAWS
3 - PULLER
4 - WRENCH

(12) Remove bearing puller tools then rotate countershaft out of gear case (Fig. 38).

(13) Remove countershaft front bearing, with Puller Flange 6444-1 and Puller Bolts 6444-4 (Fig. 39).

(14) Position first Jaw 6451 on bearing and seat puller flange in notch of puller jaw.

(15) Install second Jaw 6451 on bearing and in notch of puller flange. Slide Collar 6444-8 over puller jaws to hold them in place.

NOTE: Retaining collar has small lip on one end and only fits one way over jaws.

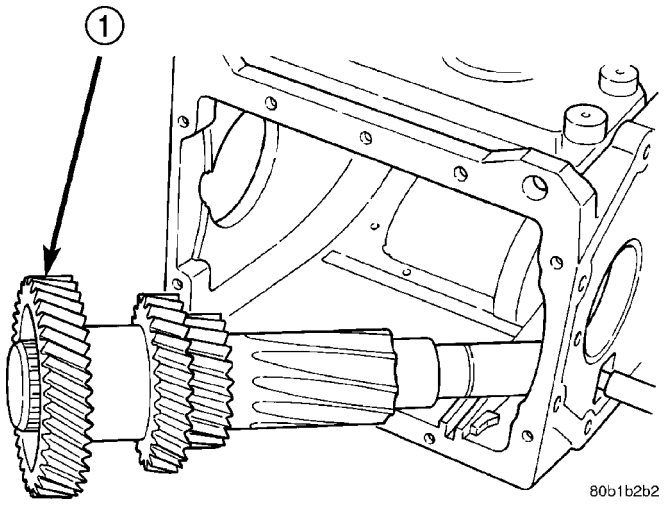

Fig. 38 COUNTERSHAFT AND CASE

1 - COUNTERSHAFT

(16) Install puller bridge and bolt assembly 6444 on puller bolts and install retaining nuts. Tighten puller bolt to remove bearing from shaft.

NOTE: If bearing is exceptionally tight, tap end of puller bolt with mallet to help loosen bearing.

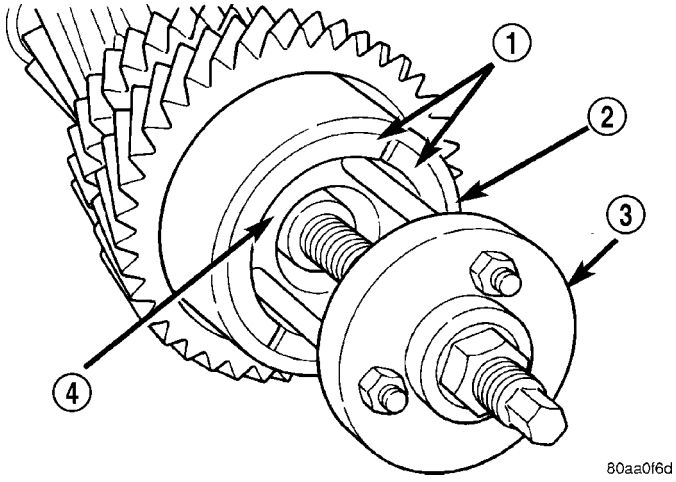

Fig. 39 Countershaft Front Bearing

1 - JAWS
2 - COLLAR
3 - PULLER
4 - FLANGE

(17) Remove bearing puller tools.

MANUAL TRANSMISSION - NV4500 (Continued)

GEAR CASE

(1) Remove countershaft front bearing cap with hammer (Fig. 40).

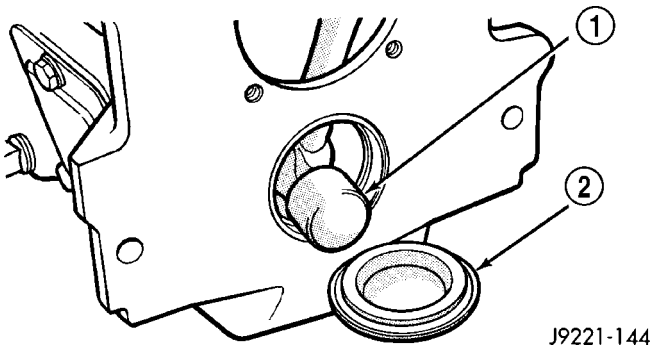

Fig. 40 COUNTERSHAFT FRONT BEARING CAP

1 - HAMMER
2 - BEARING CAP

(2) Remove countershaft front bearing cup with Remover 6454 and Handle C-4171 (Fig. 41).

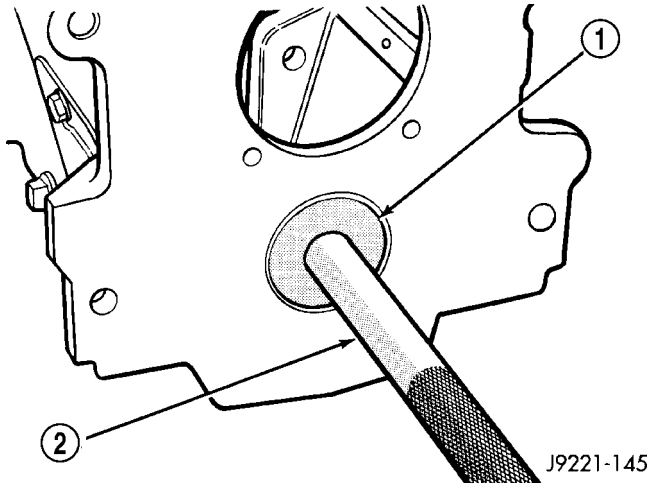

Fig. 41 COUNTERSHAFT FRONT BEARING CUP

1 - REMOVER
2 - HANDLE

(3) Remove roll pin that secures shift lug on shift rail in case (Fig. 42). A small pin punch can be modified by putting a slight bend in it to drive pin completely out of shift rail (Fig. 42).

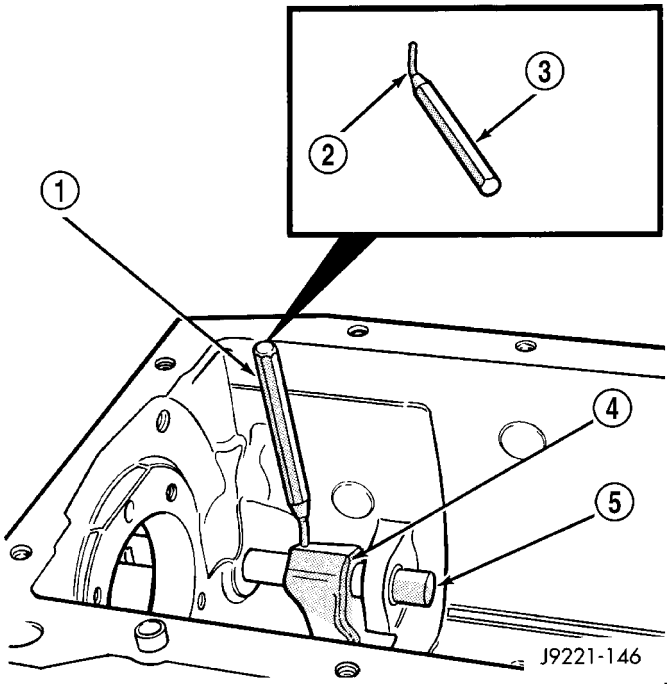

Fig. 42 SHIFT LUG ROLL PIN

1 - PUNCH
2 - 30° BEND
3 - PIN PUNCH MODIFICATION
4 - SHIFT LUG
5 - SHIFT RAIL

(4) Remove shift lug rail.

MANUAL TRANSMISSION - NV4500 (Continued)

MAINSHAFT

NOTE: Gear and synchro components can be installed backwards. Paint or scribe gear and synchro components for installation reference. Then stack geartrain parts in order of removal.

(1) Remove drive gear thrust bearing from end of mainshaft, if not previously removed.

(2) Place 3-4 gear in a press with support under 3rd gear and Remove 3-4 synchro hub, third gear stop ring and third gear as an assembly (Fig. 43).

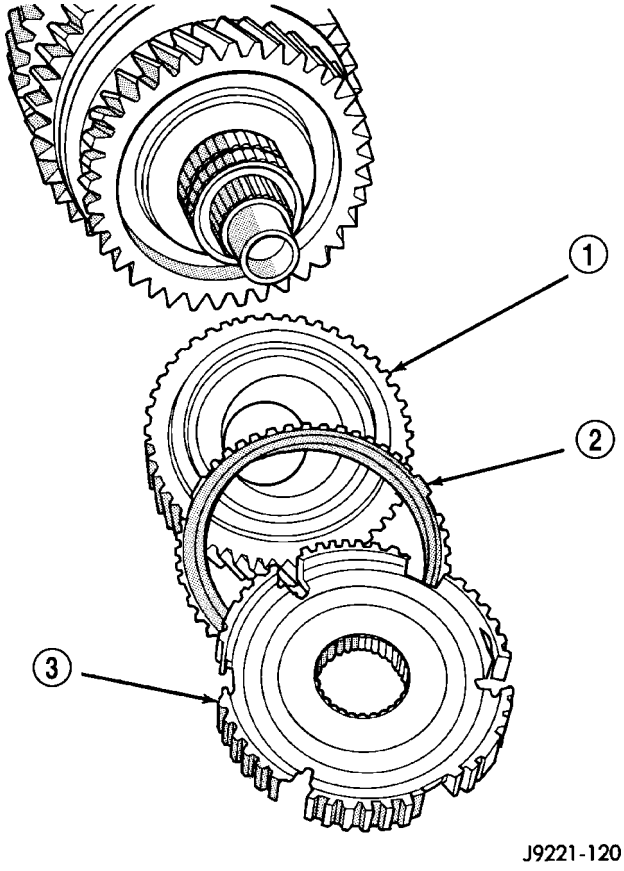

Fig. 43 THIRD GEAR, STOP RING, AND 3-4 HUB

1 - THIRD GEAR
2 - THIRD GEAR STOP RING
3 - 3-4 SYNCHRO HUB

(3) Remove third gear bearing from mainshaft (Fig. 44).

(4) Remove third gear bearing spacer (Fig. 45).

(5) Remove second gear thrust washer snap ring from mainshaft (Fig. 45).

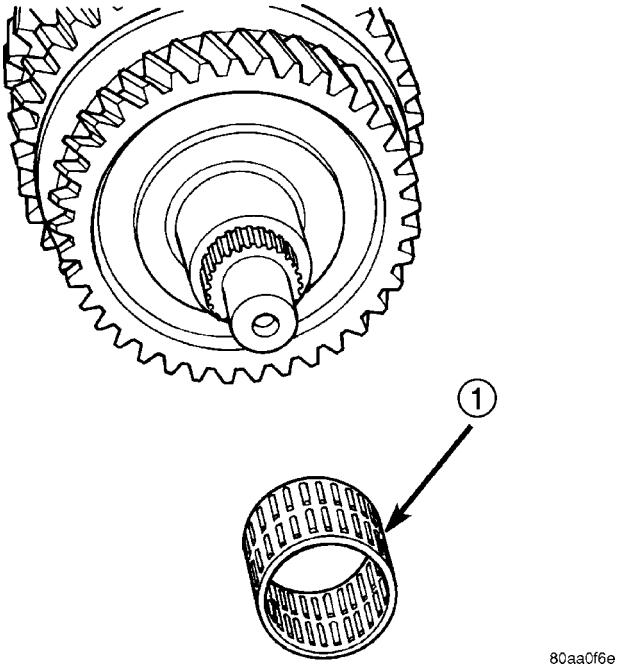

Fig. 44 THIRD GEAR BEARING

1 - THIRD GEAR NEEDLE BEARING

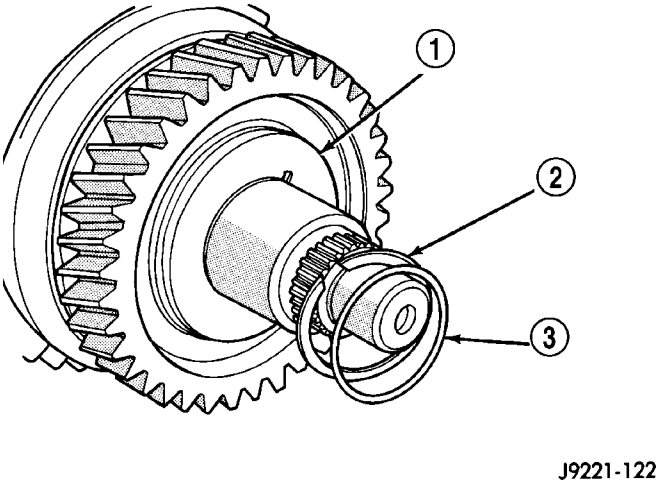

Fig. 45 SNAP RING AND THIRD GEAR BEARING SPACER

1 - SECOND GEAR THRUST WASHER
2 - THRUST WASHER SNAP RING
3 - THIRD GEAR BEARING SPACER

MANUAL TRANSMISSION - NV4500 (Continued)

(6) Remove second gear thrust washer (Fig. 46). Note washer notch for locating pin.

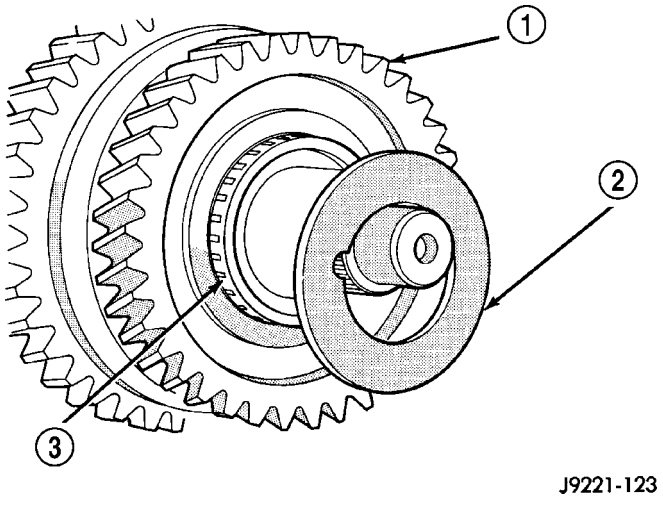

Fig. 46 SECOND GEAR THRUST WASHER

1 - SECOND GEAR
2 - THRUST WASHER
3 - SECOND GEAR BEARING

(7) Remove thrust washer locating pin (Fig. 47) with needle nose pliers.

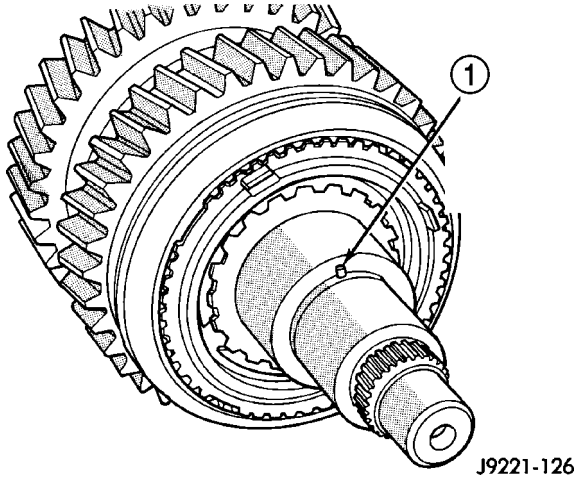

Fig. 47 THRUST WASHER LOCATING PIN

1 - THRUST WASHER LOCATING PIN

(8) Remove second gear (Fig. 48).

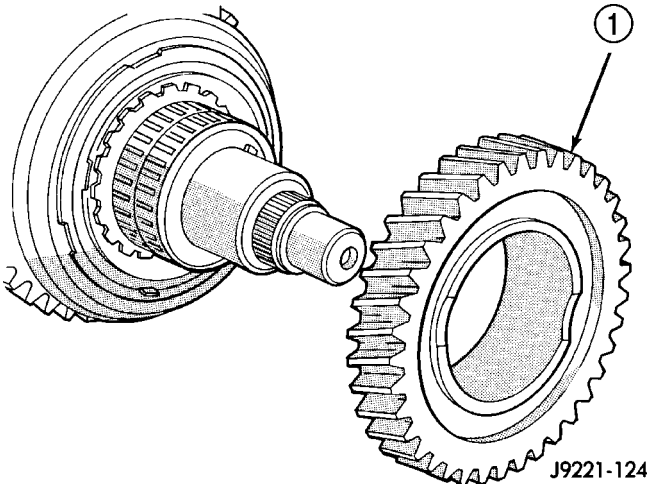

Fig. 48 SECOND GEAR

1 - SECOND GEAR

(9) Remove second gear bearing (Fig. 49).

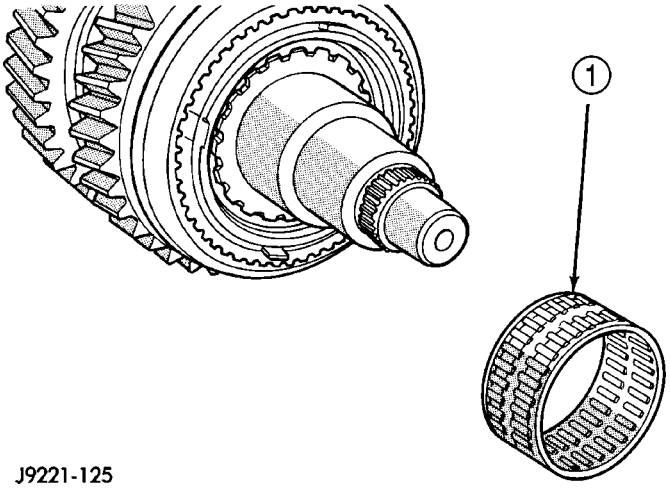

Fig. 49 SECOND GEAR BEARING

1 - SECOND GEAR NEEDLE BEARING

MANUAL TRANSMISSION - NV4500 (Continued)

(10) Remove second gear clutch cone snap ring from mainshaft synchro hub groove (Fig. 50).

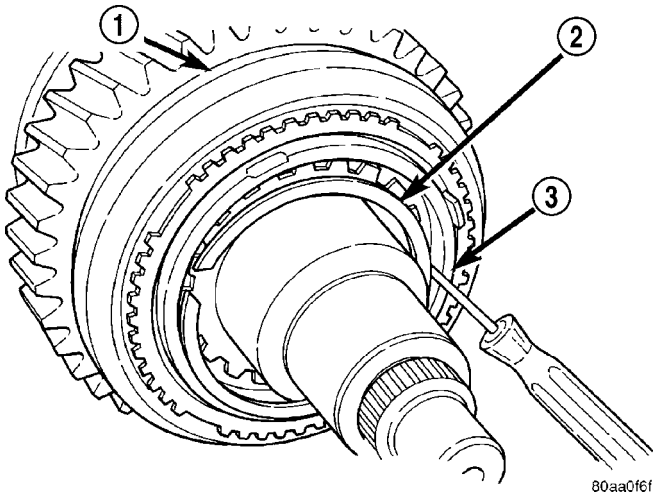

Fig. 50 SECOND GEAR CLUTCH CONE SNAP RING

1 - 1-2 SLEEVE
2 - SNAP RING
3 - SECOND GEAR CLUTCH CONE

(11) Remove second gear clutch cone, synchro clutch ring and synchro stop ring (Fig. 51).

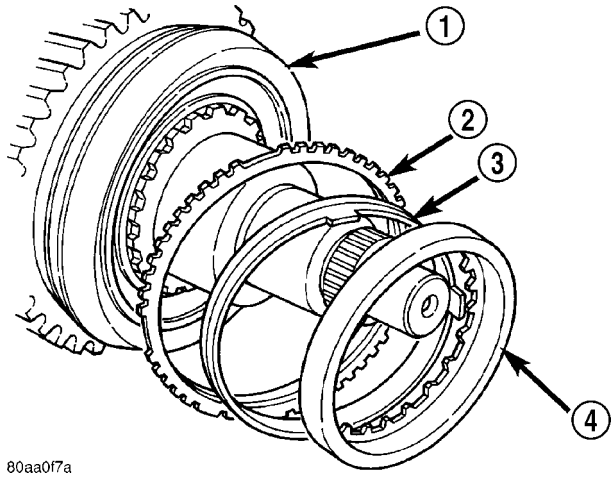

Fig. 51 SECOND GEAR CLUTCH CONE AND RING

1 - 1-2 SLEEVE AND HUB
2 - SYNCHRO STOP RING
3 - CLUTCH RING
4 - SECOND GEAR CLUTCH CONE

(12) Remove 1-2 synchro hub snap ring (Fig. 52).

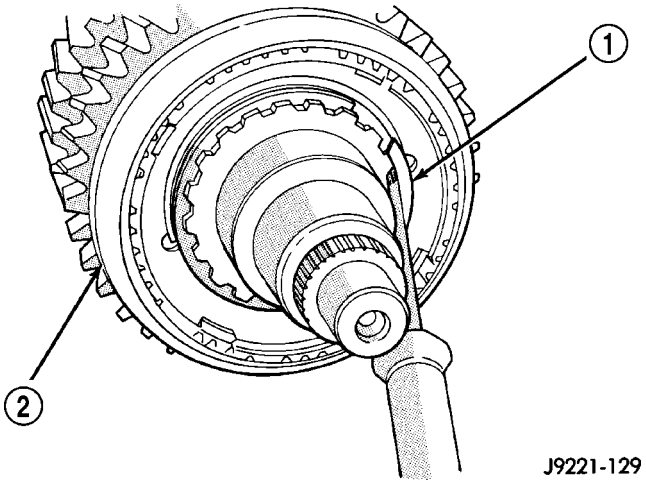

Fig. 52 1-2 SLEEVE AND HUB SNAP RING

1 - 1-2 HUB SNAP RING
2 - 1-2 SLEEVE AND HUB

(13) Remove 1-2 synchro sleeve, hub, struts and springs as an assembly (Fig. 53).

NOTE: Tapered side of sleeve also goes toward front. Do not disassemble synchro components unless worn or damaged.

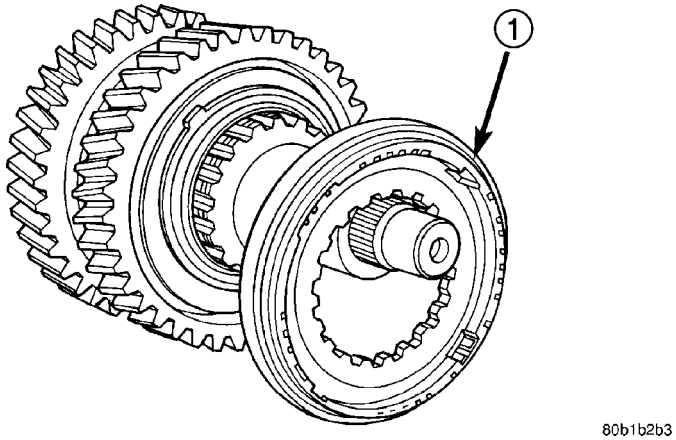

Fig. 53 1-2 SYNCHRO SLEEVE AND HUB

1 - 1-2 SLEEVE AND HUB

MANUAL TRANSMISSION - NV4500 (Continued)

(14) Remove first gear synchro stop ring and clutch ring (Fig. 54).

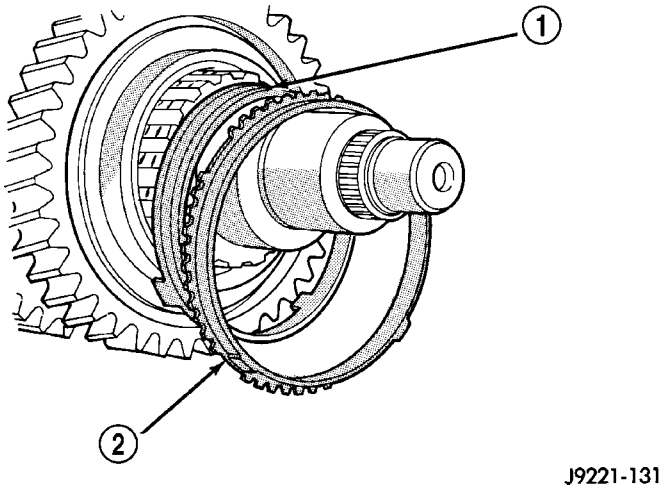

Fig. 54 FIRST GEAR STOP AND CLUTCH RING

1 - FIRST GEAR CLUTCH RING
2 - FIRST GEAR STOP RING

(15) Remove first gear clutch cone front snap ring from mainshaft hub (Fig. 55).

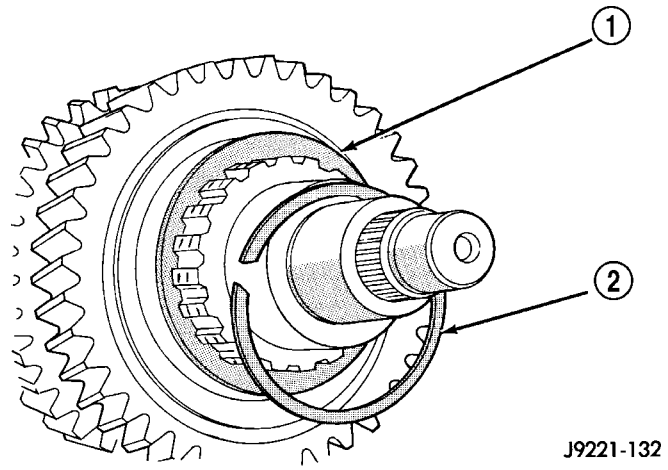

Fig. 55 FIRST GEAR CLUTCH GEAR FRONT SNAP RING

1 - FIRST SPEED CLUTCH GEAR
2 - CLUTCH GEAR SNAP RING (FRONT)

(16) Remove first gear clutch cone (Fig. 56).

(17) Remove first gear clutch gear rear snap ring from mainshaft hub (Fig. 56).

NOTE: Do not remove this snap ring unless mainshaft is being replaced.

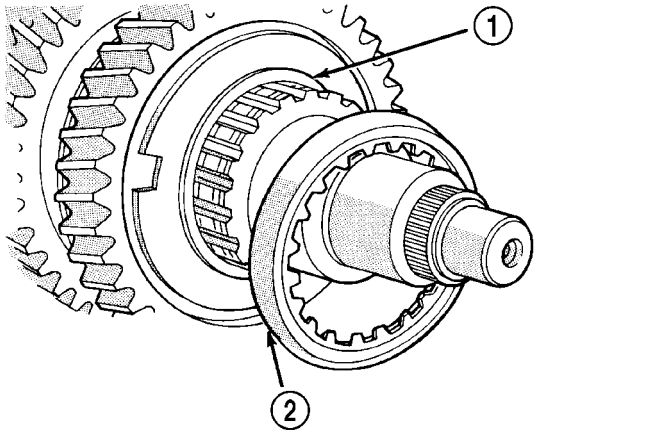

Fig. 56 FIRST GEAR CLUTCH GEAR

1 - CLUTCH GEAR SNAP RING (REAR)
2 - FIRST SPEED CLUTCH GEAR

MANUAL TRANSMISSION - NV4500 (Continued)

(18) Remove mainshaft rear bearing, with Puller Flange 6444-1 and Puller Rods 6444-3 for 4X2 or 6444-4 for 4X4.

(19) Position the first Jaw 6445 on the bearing cone and seat Puller Flange 6444-1 in notch of jaw (Fig. 57).

(20) Install second Jaw 6445 on the bearing cone and puller flange. Slide Collar 6444-8 over jaws to hold them in place.

(21) Install Puller 6444 on the puller rods and secure with nuts (Fig. 58). Tighten puller bolt to the remove bearing.

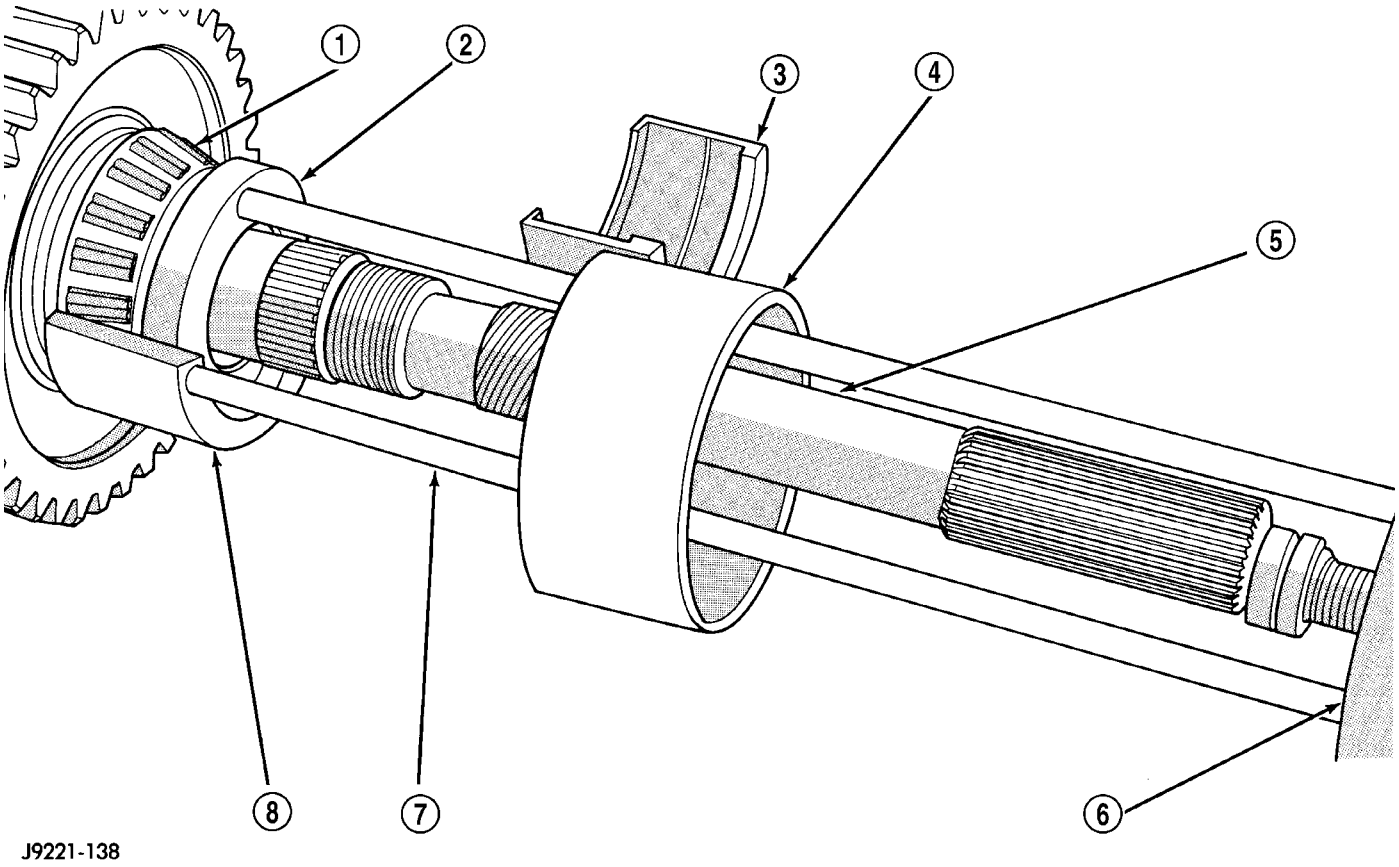

Fig. 57 MAINSHAFT REAR BEARING PULLER

1 - REAR BEARING
2 - FLANGE
3 - JAW
4 - COLLAR
5 - MAINSHAFT
6 - PULLER
7 - RODS
8 - JAW

MANUAL TRANSMISSION - NV4500 (Continued)

(22) Remove bearing puller tools and rear mainshaft bearing from output shaft.

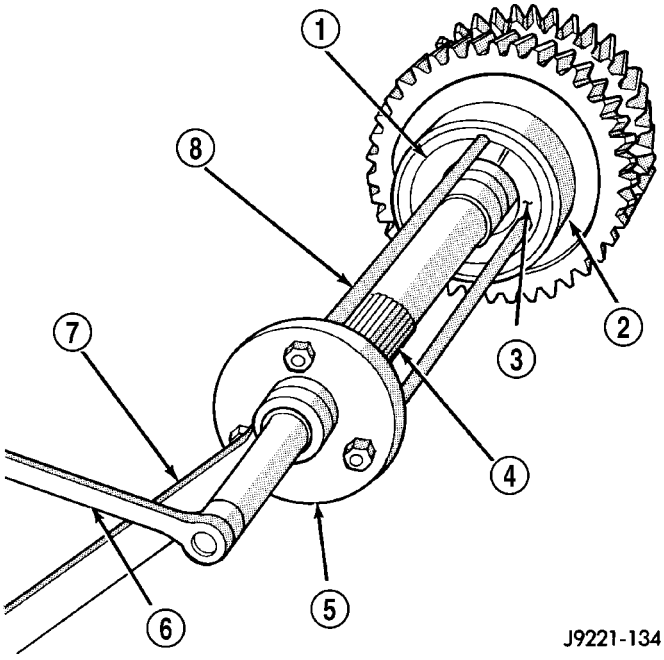

Fig. 58 MAINSHAFT REAR BEARING

1 - JAWS
2 - COLLAR
3 - FLANGE
4 - MAINSHAFT
5 - PULLER
6 - TIGHTENING WRENCH
7 - HOLDING WRENCH
8 - RODS

(23) Remove reverse gear thrust washer (Fig. 59).

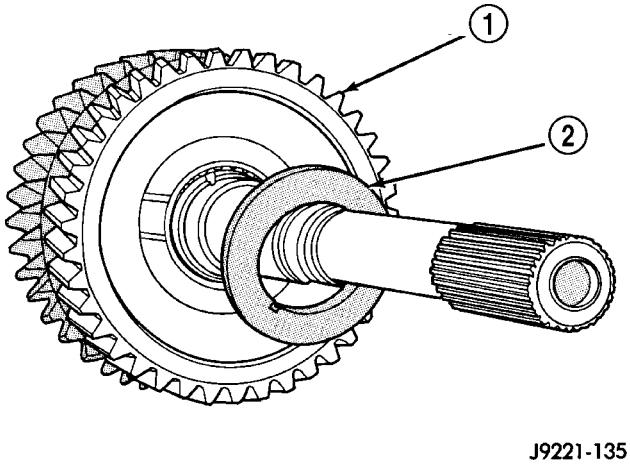

Fig. 59 REVERSE GEAR THRUST WASHER

1 - REVERSE GEAR
2 - THRUST WASHER

(24) Remove reverse gear and synchro components as assembly (Fig. 60).

CAUTION: Do not disassemble synchro components unless they are damaged. If synchro sleeve or struts require service, mark position of sleeve on hub before removal. Correct sleeve position is important as sleeve can be installed backwards causing shift problems.

(25) Remove reverse gear bearing assembly from mainshaft (Fig. 60).

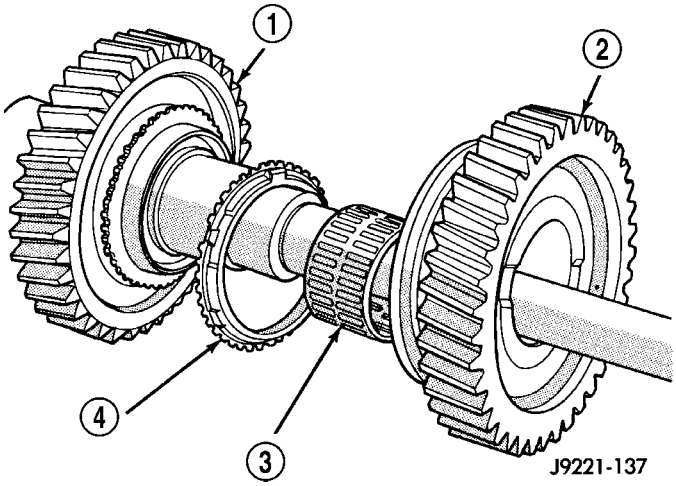

Fig. 60 REVERSE GEAR, BEARING, AND STOP RING

1 - FIRST GEAR
2 - REVERSE GEAR ASSEMBLY
3 - BEARING ASSEMBLY
4 - STOP RING

(26) Remove reverse gear bearing spacer from mainshaft (Fig. 61).

(27) Remove reverse clutch gear snap ring (Fig. 61). Heavy duty snap ring pliers will be required to spread the ring far enough to remove it.

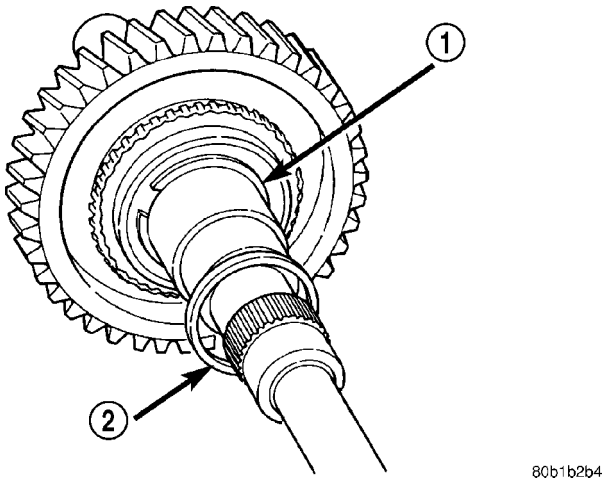

Fig. 61 REVERSE GEAR BEARING SPACER AND FIRST GEAR SNAP RING

1 - CLUTCH GEAR SNAP RING
2 - REVERSE GEAR BEARING SPACER

(28) Remove reverse clutch gear (Fig. 62).

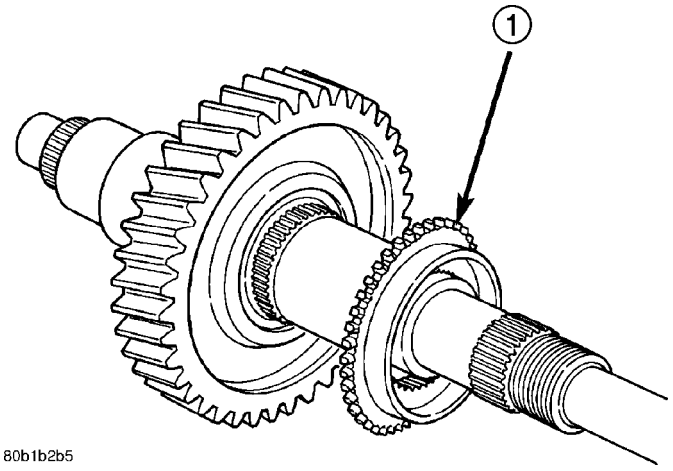

Fig. 62 Reverse Clutch Gear

1 - REVERSE CLUTCH GEAR

(29) Remove first gear from bearing and mainshaft (Fig. 63).

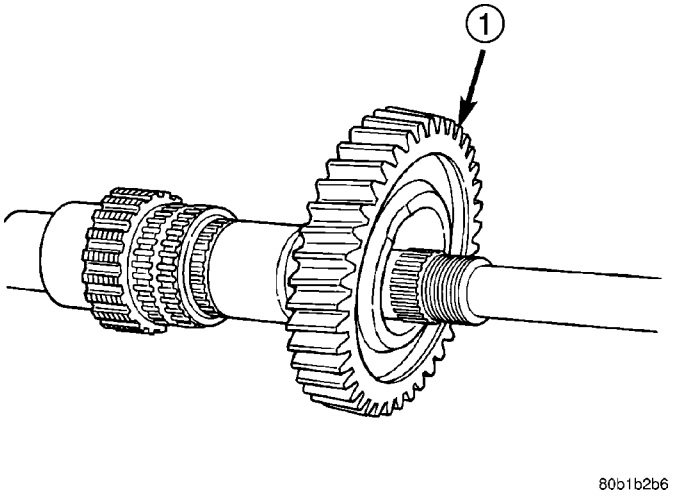

Fig. 63 FIRST GEAR

1 - FIRST GEAR

(30) Remove first gear bearing from mainshaft (Fig. 64).

CLEANING

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean the shaft bearings with a mild solvent such as Mopar degreasing solvent, Gunk or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

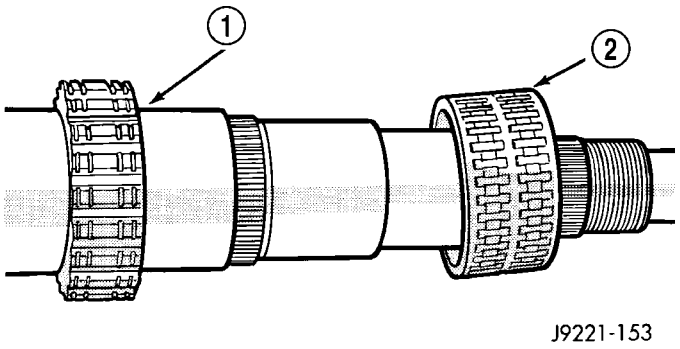

Fig. 64 FIRST GEAR BEARING

1 - MAINSHAFT
2 - FIRST GEAR BEARING

INSPECTION

NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.

Inspect the reverse idler gear, bearings, shaft and thrust washers. Replace the bearings if the rollers are worn, chipped, cracked, flat-spotted or brinnelled. Replace the gear if the teeth are chipped, cracked or worn thin.

Inspect the front bearing retainer and bearing cup. Replace the bearing cup if scored, cracked, brinnelled or rough. Check the release bearing slide surface of the retainer carefully. Replace the retainer if worn or damaged in any way.

Inspect mainshaft bearing surfaces, splines, snap ring grooves and threads. Replace the shaft if any surfaces exhibit considerable wear or damage.

Inspect the countershaft and bearings. Replace the shaft if any surfaces exhibit considerable wear or damage.

Inspect shift forks for wear and distortion. Check fit of the sleeve in the fork to be sure the two parts fit and work smoothly. Replace the fork if the roll pin holes are worn oversize or damaged. Do not attempt to salvage a worn fork. Replace shift fork roll pins if necessary or if doubt exists about their condition.

The all bearings for wear, roughness, flat spots, pitting or other damage. Replace the bearings if necessary.

Inspect the blocker rings and fiction cones. replace either part if worn or damaged in any way. Replace if the friction material is burned, flaking off or worn.

Inspect synchro components wear or damage. Replace parts if worn, cracked or distorted.

Inspect all of the thrust washers and locating pins. Replace the pins if bent or worn. Replace the washers if worn or the locating pin notches are distorted.

Inspect the case and housing/adapter sealing and mating surfaces are free of burrs and nicks. Inspcet

the alignment dowels in the case top surface and in the housing/adapter are tight and in good condition. Replace the gear case or housing/adapter if cracked or broken.

ASSEMBLY

NOTE: Gaskets are not used in the transmission. Use Mopar Silicone Sealer or equivalent on all gear case and extension housing sealing surfaces.

COUNTERSHAFT AND REVERSE IDLER GEAR

(1) Install countershaft front bearing cup in case with Handle C-4171 and Installer 6061-1.

(2) Install front bearing on countershaft with Installer C-4340 (Fig. 65).

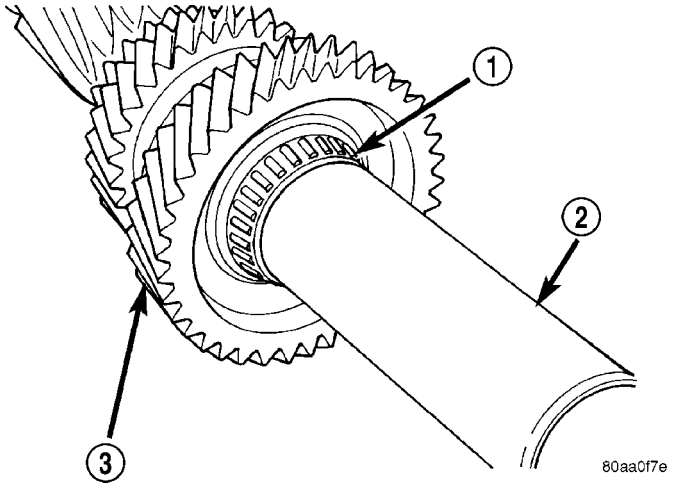

Fig. 65 COUNTERSHAFT FRONT BEARING

1 - FRONT BEARING
2 - INSTALLER
3 - COUNTERSHAFT

(3) Lubricate countershaft front bearing cup and cone with petroleum jelly.

(4) Position gear case on end with rear of case facing up (Fig. 66).

(5) Install countershaft in gear case (Fig. 66).

NOTE: Do not install rear countershaft bearing on countershaft at this time.

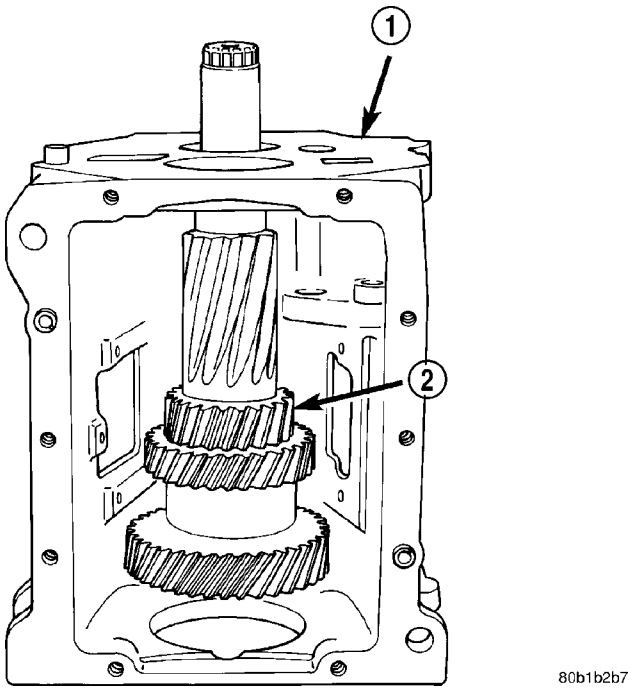

Fig. 66 COUNTERSHAFT IN GEAR CASE

1 - GEAR CASE
2 - COUNTERSHAFT

(6) Lubricate reverse idler gear bearings with petroleum jelly and install first bearing and second bearing (Fig. 67).

(7) Install idler gear front thrust washer on boss in gear case (Fig. 67). Coat thrust washer with liberal quantity of petroleum jelly to hold it in place.

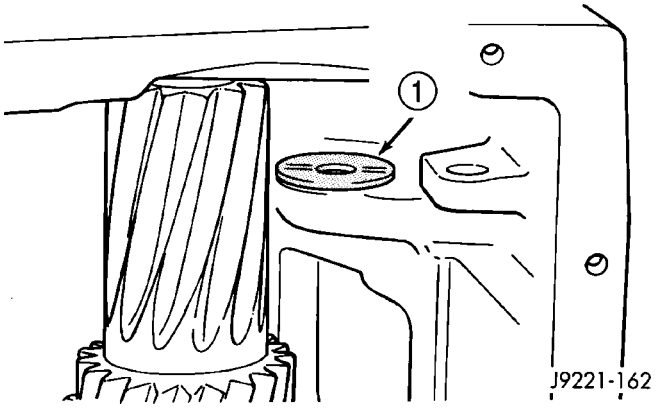

Fig. 67 IDLER GEAR FRONT THRUST WASHER

1 - IDLER GEAR FRONT THRUST WASHER ON BOSS

(8) Install reverse idler gear in case (Fig. 68).

(9) Install idler gear rear thrust washer between idler gear and case boss (Fig. 68).

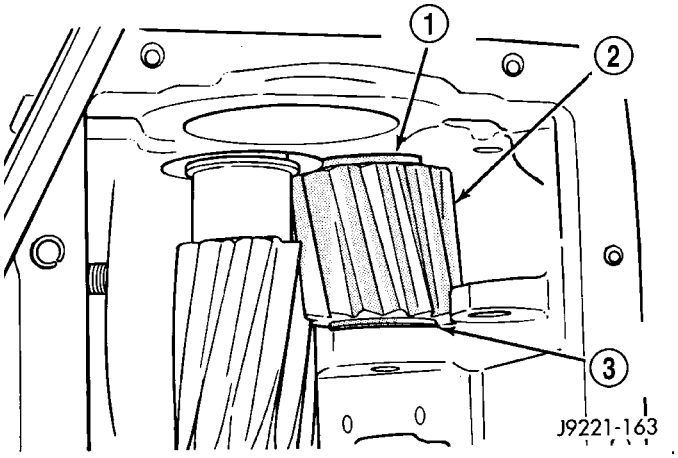

Fig. 68 IDLER GEAR

1 - REAR THRUST WASHER
2 - REVERSE IDLER GEAR
3 - FRONT THRUST WASHER

(10) Align idler gear bearings and thrust washers with a drift.

(11) Install reverse idler shaft with notched end of shaft facing countershaft (Fig. 69).

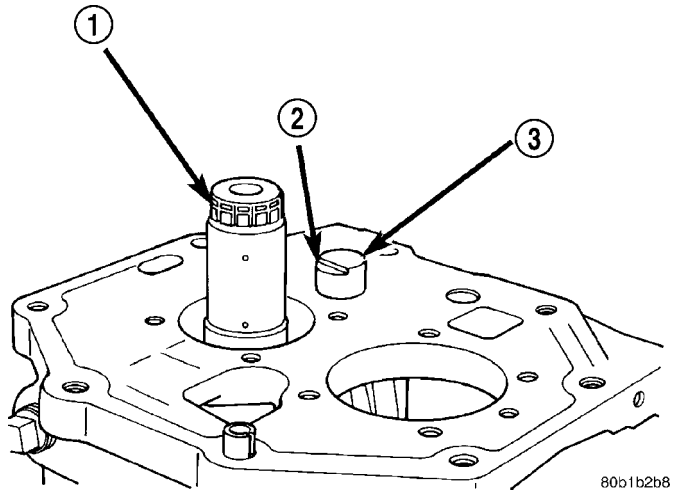

Fig. 69 REVERSE IDLER SHAFT

1 - COUNTERSHAFT
2 - SHAFT NOTCH
3 - REVERSE IDLER SHAFT

(12) Lift countershaft upward and position wood block between front of shaft and case (Fig. 70).

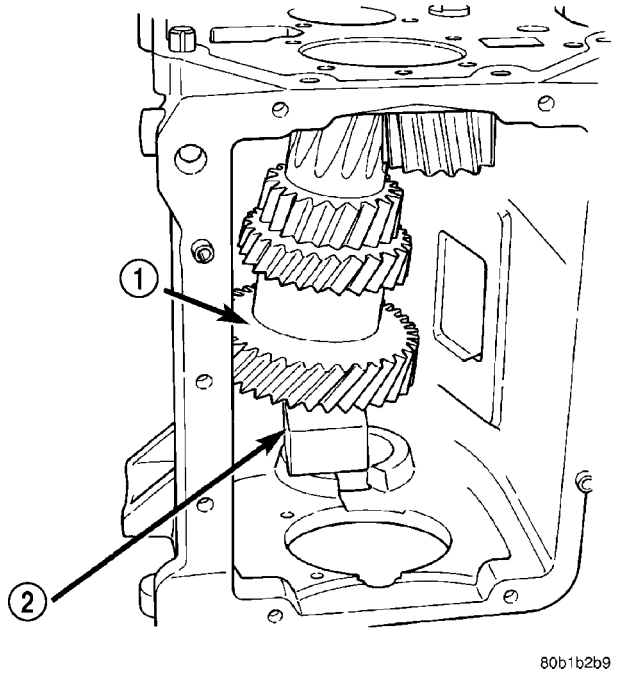

Fig. 70 SUPPORTING COUNTERSHAFT

1 - COUNTERSHAFT
2 - WOOD BLOCK

(13) Install rear bearing cone on countershaft with Installer C-4040 (Fig. 71).

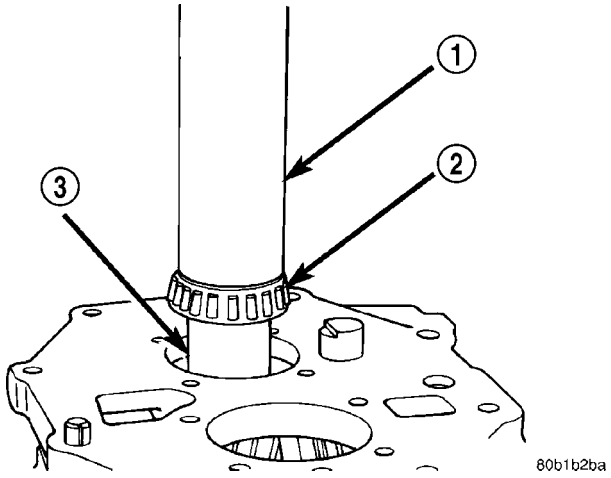

Fig. 71 COUNTERSHAFT REAR BEARING

1 - INSTALLER
2 - REAR BEARING
3 - COUNTERSHAFT

MANUAL TRANSMISSION - NV4500 (Continued)

(14) Remove wood block from under countershaft and lower countershaft front bearing into front bearing cup.

(15) Lubricate countershaft rear bearing cup and cone with petroleum jelly.

(16) Install countershaft rear bearing cup in gear case and over rear bearing (Fig. 72). Tap cup into place with plastic mallet if necessary.

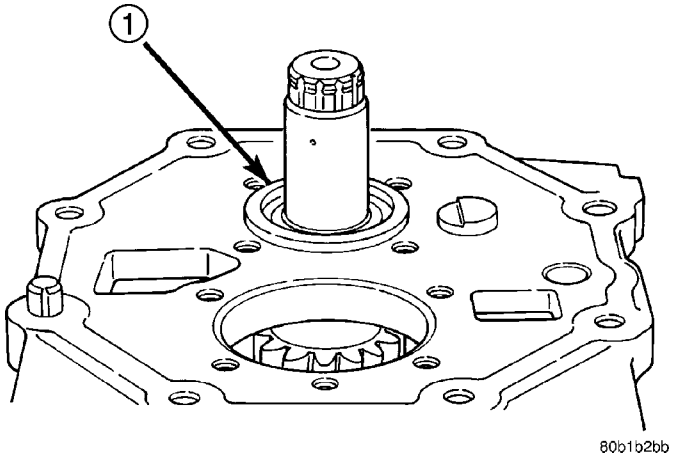

Fig. 72 COUNTERSHAFT REAR BEARING CUP

1 - COUNTERSHAFT REAR BEARING CUP

(17) Install countershaft rear bearing plate (Fig. 73).

NOTE: Verify plate is seated in notch in reverse idler shaft before tightening bearing plate bolts.

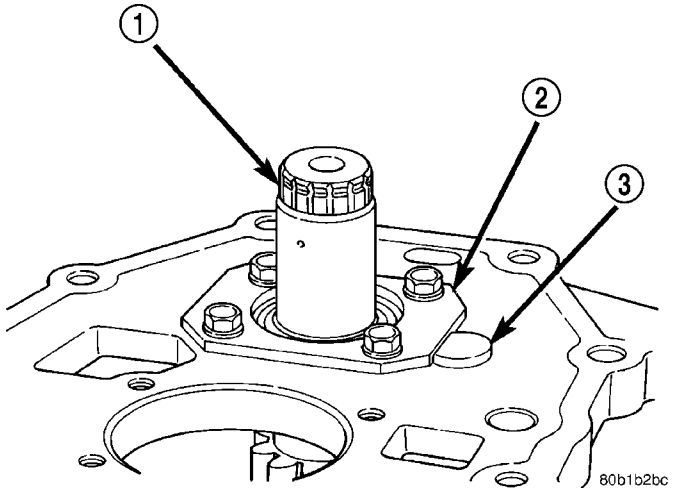

Fig. 73 COUNTERSHAFT REAR BEARING PLATE

1 - COUNTERSHAFT
2 - REAR BEARING PLATE
3 - IDLER SHAFT

(18) Apply Mopar silicone adhesive/sealer or equivalent to flange and lip of new cap. Install **new** front bearing cap in gear case (Fig. 74) with Handle C-4171 and Installer C-3972-A.

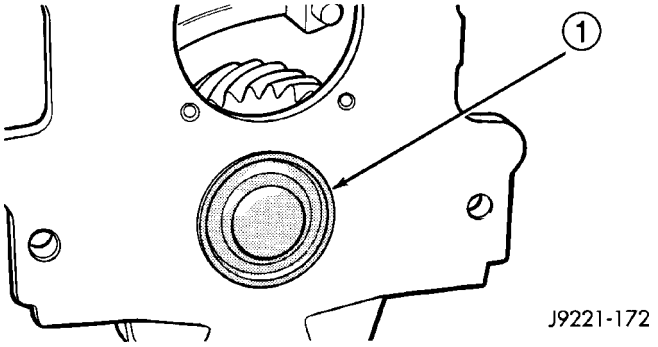

Fig. 74 COUNTERSHAFT FRONT BEARING CAP

1 - FRONT BEARING CAP

COUNTERSHAFT END PLAY

(1) Rotate countershaft 4-5 times to seat bearings.

(2) Mount dial indicator on case. Then position indicator plunger on end of countershaft and zero dial indicator (Fig. 75).

(3) Raise countershaft with screwdriver and note end play reading on dial indicator. End play should be 0.051 - 0.15 mm (0.002 - 0.006 in.).

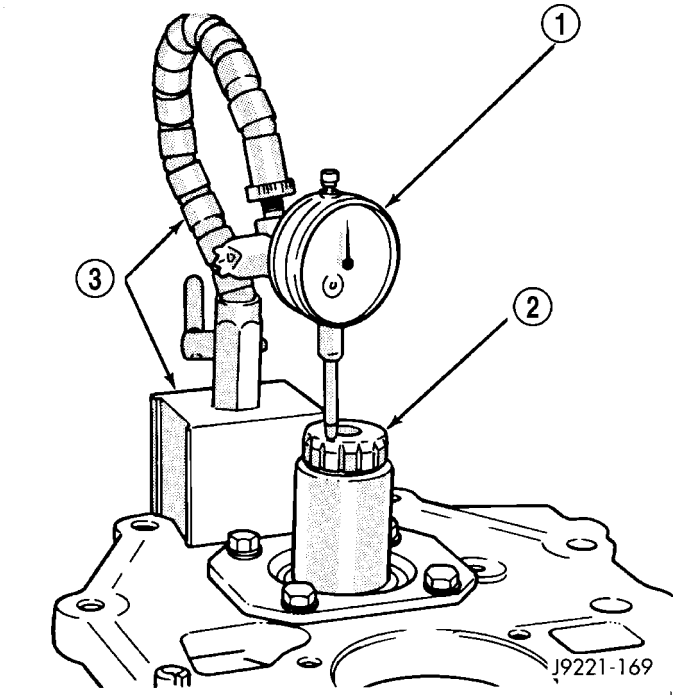

Fig. 75 MEASURING COUNTERSHAFT END PLAY

1 - DIAL INDICATOR
2 - COUNTER SHAFT
3 - INDICATOR MOUNTING ARM AND BASE

(4) Remove countershaft rear bearing plate.
(5) Install a end play shim that will provide minimum countershaft end play. Position shim on rear bearing cup (Fig. 76).

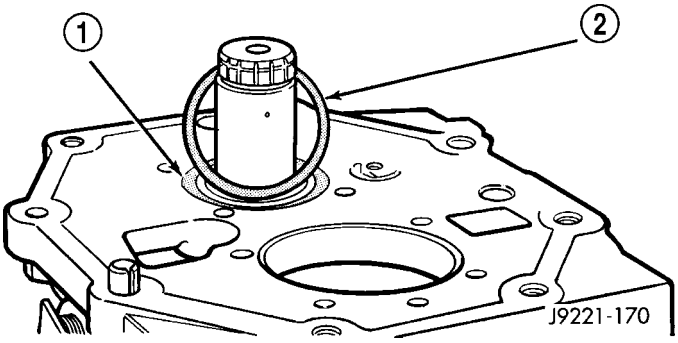

Fig. 76 COUNTERSHAFT END PLAY SHIM

1 - REAR BEARING CUP
2 - END PLAY SHIM (SELECTIVE)

(6) Install countershaft rear bearing plate (Fig. 73).

NOTE: Verify plate is seated in reverse idler shaft notch and end play shims are still in position before installing bolts.

(7) Apply 1-2 drops Mopar Loc N' Seal or equivalent to threads of rear bearing plate bolts. Then install and tighten bearing plate bolts to 23 N·m (200 in. lbs.).

SHIFT LUG AND RAIL

(1) Lubricate shift lug and rail with Castrol® Syntorq or equivalent.
(2) Insert shift lug rail part way into case.
(3) Install shift lug on rail.
(4) Position shift rail so roll pin notches are toward outside of case (Fig. 77).
(5) Install roll pin that secures lug to rail (Fig. 77).

MAINSHAFT AND GEARTRAIN

CAUTION: The reverse, 1-2 and 3-4 synchro components can be assembled and installed incorrectly. Follow assembly procedures for component identification and location.

Lubricate mainshaft bearing surfaces and all bearing assemblies with Castrol® Syntorq or with petroleum jelly.

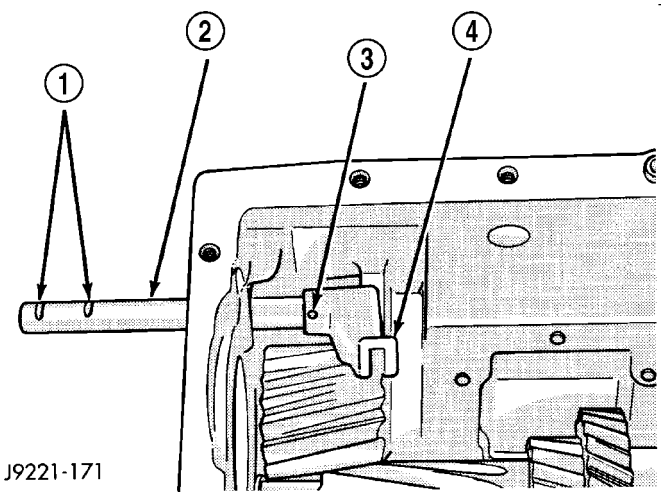

Fig. 77 SHIFT LUG AND RAIL

1 - NOTCHES (FOR 5TH GEAR SHIFT FORK ROLL PINS)
2 - LUG RAIL
3 - ROLL PIN HOLE
4 - SHIFT LUG

(1) Install first snap ring in rear most groove of mainshaft hub (Fig. 78). This snap ring locates first gear clutch gear on shaft.

NOTE: Four of these snap rings are used to secure various components on the mainshaft 1-2 synchro hub. The snap rings are all the same size and are interchangeable.

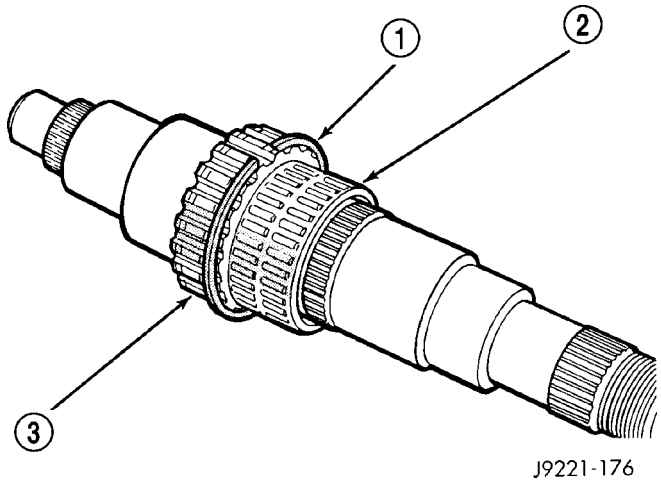

Fig. 78 FIRST GEAR BEARING AND SNAP RING

1 - SNAP RING
2 - FIRST GEAR BEARING
3 - MAINSHAFT SYNCHRO HUB

(2) Install first gear clutch cone on mainshaft 1-2 synchro hub with recessed side of cone facing front (Fig. 79). Verify cone is seated against snap ring on hub.

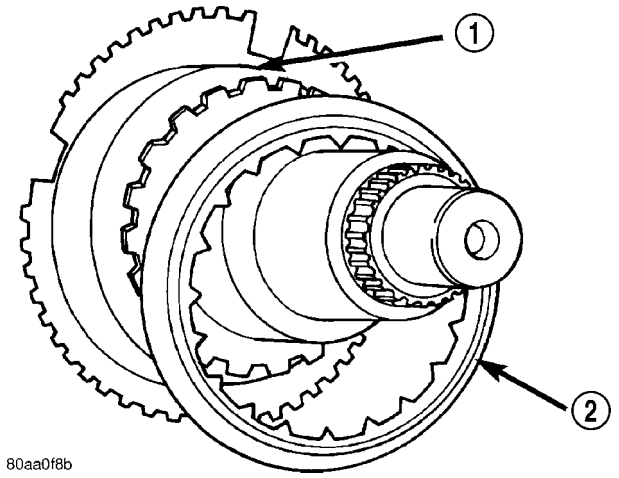

Fig. 79 FIRST GEAR CLUTCH CONE

1 - MAINSHAFT 1-2 SYNCHRO HUB
2 - FIRST GEAR CLUTCH CONE

(3) Install snap ring on mainshaft 1-2 synchro hub to secure clutch cone (Fig. 80). Verify snap ring is seated in hub groove and against clutch cone.

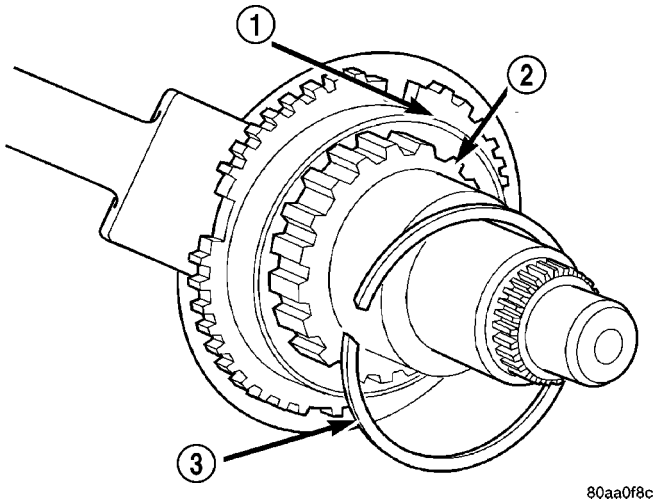

Fig. 80 FIRST GEAR CLUTCH CONE SNAP RING

1 - FIRST GEAR CLUTCH CONE
2 - MAINSHAFT 1-2 SYNCHRO HUB
3 - CLUTCH CONE SNAP RING

(4) Support mainshaft in upright position to install remaining gears, snap rings and synchro components. Shaft can be supported in gear case or hole can be cut in workbench to support shaft.

(5) If 1-2 synchro hub and sleeve were disassembled for service, reassemble hub, sleeve, struts and springs as follows:

(a) Align and install sleeve on hub. Rotate sleeve until it slides onto hub. Sleeve only fits one way and will easily slide onto hub when long slot in sleeve, aligns with long shoulder on hub (Fig. 81).

(b) Place wood blocks under hub that will raise hub about 3.5 cm (1.375 in.) above surface of workbench. Then allow sleeve to drop down on hub (Fig. 82).

(c) Install springs and struts in hub (Fig. 82). Use lots of petroleum jelly to hold them in place. Then compress struts with your fingers and move sleeve upward until struts are started in sleeve. Verify that struts are engaged in sleeve before proceeding.

(d) Turn synchro assembly upright. Then move sleeve into neutral position on hub and work struts into sleeve at same time. Be sure struts are seated and springs are not displaced during assembly.

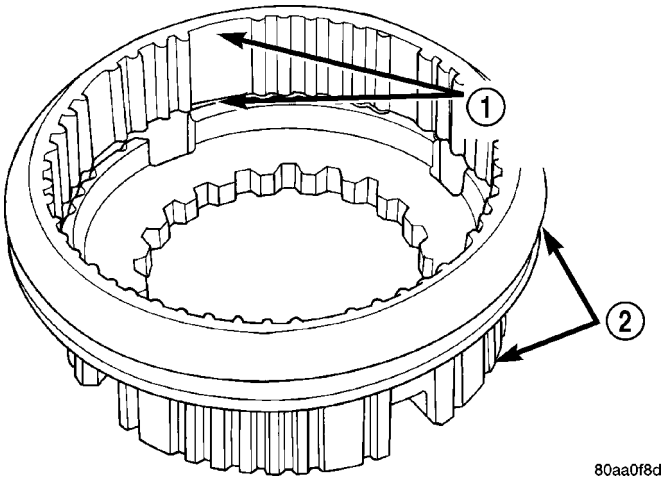

Fig. 81 1-2 SYNCHRO SLEEVE ON HUB

1 - ALIGN WIDE SLOT IN SLEEVE WITH WIDE SPLINE OF HUB
2 - 1-2 SLEEVE AND HUB

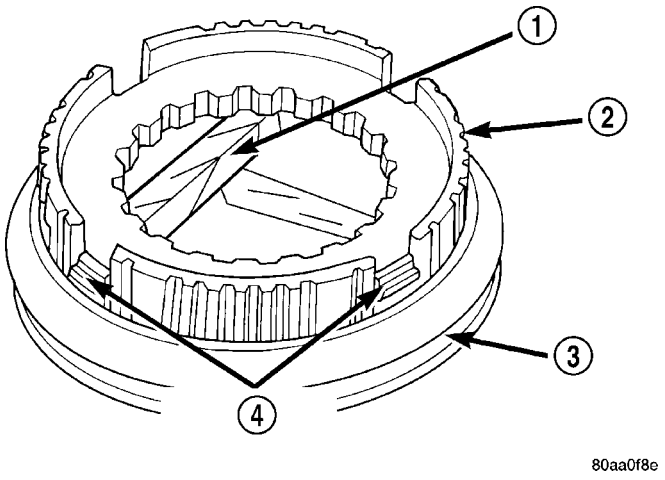

Fig. 82 1-2 SYNCHRO STRUTS AND SPRINGS

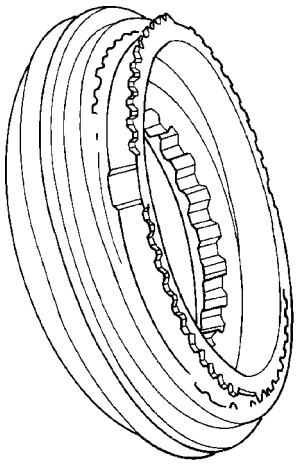
1 - WOOD BLOCKS
2 - HUB
3 - SLEEVE
4 - STRUTS AND SPRINGS (4 EACH)

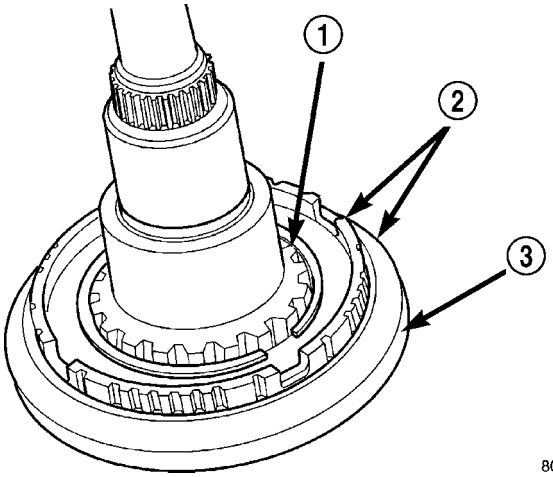
(6) Install first gear stop ring in 1-2 synchro hub and sleeve (Fig. 83). Verify stop ring is seated and engaged in hub and sleeve.



80aa0f8f

Fig. 83 FIRST GEAR STOP RING IN SYNCHRO HUB

(7) Install 1-2 synchro assembly and stop ring on mainshaft with the taper on the sleeve facing forward. (Fig. 84).

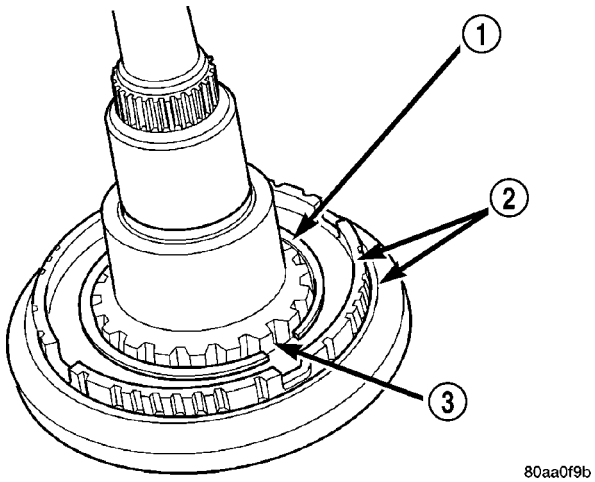


80aa0f9a

Fig. 84 1-2 SYNCHRO

1 - MAINSHAFT HUB
2 - 1-2 SYNCHRO ASSEMBLY
3 - TAPERED SIDE OF SLEEVE

(8) Install snap ring that secures 1-2 synchro on mainshaft hub (Fig. 85). Verify snap ring is seated in groove in mainshaft hub.

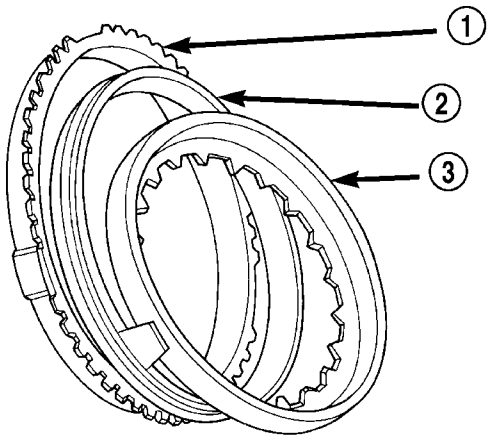


80aa0f9b

Fig. 85 1-2 SYNCHRO SNAP RING

1 - SYNCHRO SNAP RING
2 - 1-2 SYNCHRO ASSEMBLY
3 - MAINSHAFT HUB

(9) Assemble second gear clutch cone, clutch ring and stop ring (Fig. 86).



80aa0f9c

Fig. 86 SECOND GEAR CLUTCH CONE, CLUTCH RING AND STOP RING

1 - STOP RING
2 - CLUTCH RING
3 - CLUTCH CONE

MANUAL TRANSMISSION - NV4500 (Continued)

(10) Install assembled second gear clutch cone and rings on mainshaft and in 1-2 synchro hub (Fig. 87).

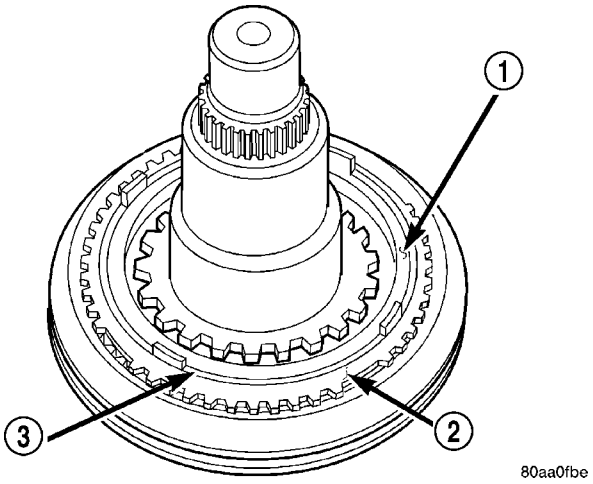


Fig. 87 SECOND GEAR CLUTCH CONE, CLUTCH RING AND STOP RING

1 - CLUTCH CONE
2 - STOP RING
3 - CLUTCH RING

(11) Install snap ring that secures second gear clutch cone on mainshaft (Fig. 88). Use narrow blade screwdriver to work snap ring into hub groove as shown. Verify snap ring is seated in mainshaft groove.

NOTE: If snap ring will not fit in groove, clutch cone is slightly misaligned.

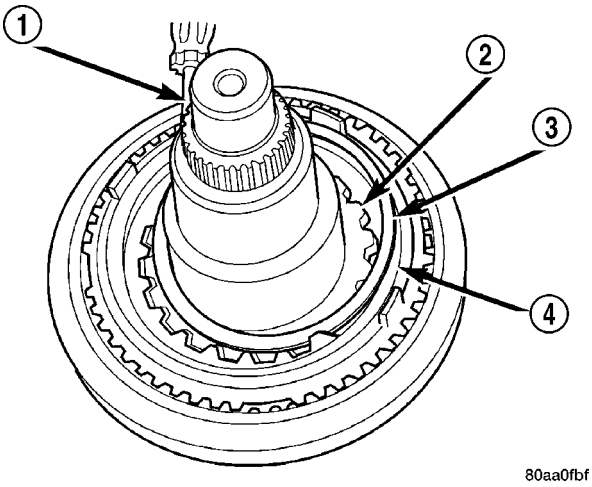

Fig. 88 SECOND GEAR CLUTCH CONE SNAP RING

1 - SCREWDRIVER
2 - MAINSHAFT HUB
3 - SNAP RING
4 - SECOND GEAR CLUTCH CONE

(12) Install second gear bearing on mainshaft (Fig. 89).

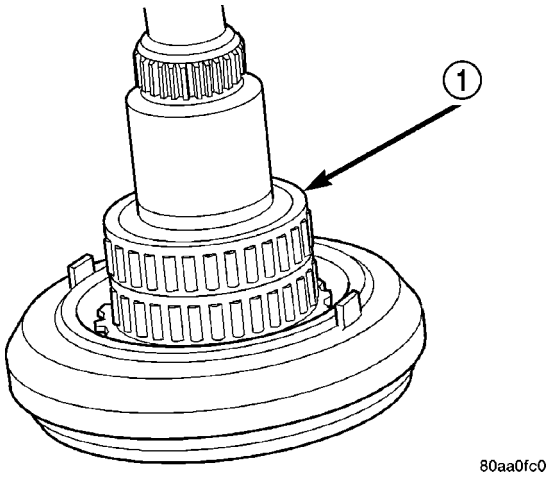

Fig. 89 SECOND GEAR BEARING

1 - SECOND GEAR BEARING

(13) Install second gear on mainshaft and bearing. Rotate gear until tabs of second gear clutch ring are seated in tab slots in gear (Fig. 90).

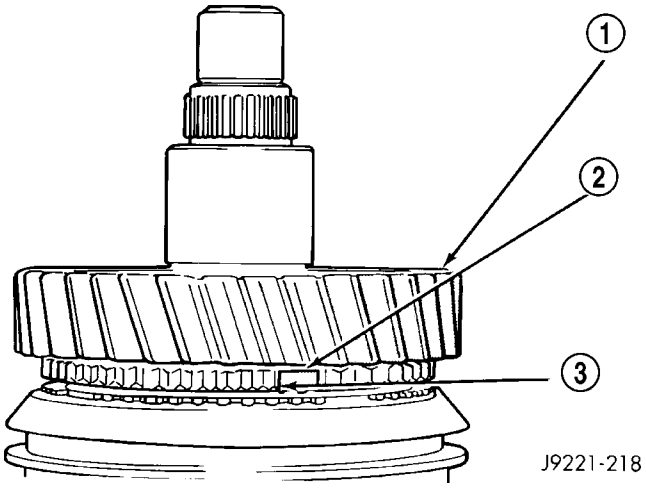

Fig. 90 SECOND GEAR

1 - SECOND GEAR
2 - CLUTCH RING TABS
3 - TAB SLOTS (IN GEAR)

(14) Install thrust washer pin in shaft (Fig. 91).

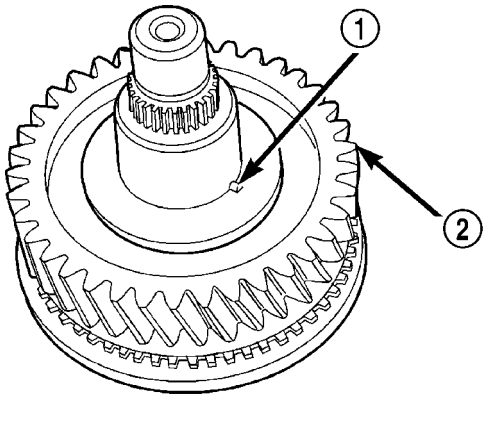

Fig. 91 THRUST WASHER PIN

1 - THRUST WASHER PIN
2 - SECOND GEAR

(15) Install second gear thrust washer. Verify washer is seated on gear and pin (Fig. 92).

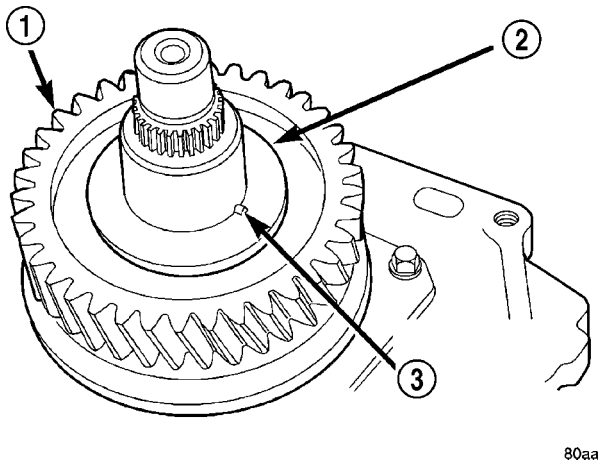

Fig. 92 SECOND GEAR THRUST WASHER

1 - SECOND GEAR
2 - SECOND GEAR THRUST WASHER
3 - LOCATING PIN IN WASHER NOTCH

(16) Install second gear thrust washer snap ring (Fig. 93). Verify snap ring is seated in mainshaft groove.

(17) Install third gear bearing spacer on shaft and seat it against thrust washer snap ring (Fig. 93).

(18) Install third gear bearing on mainshaft (Fig. 94). Bearing should be flush with mainshaft hub.

NOTE: If bearing is not flush with hub, the bearing spacer or snap ring was not installed.

(19) Install third gear over bearing and onto mainshaft (Fig. 95).

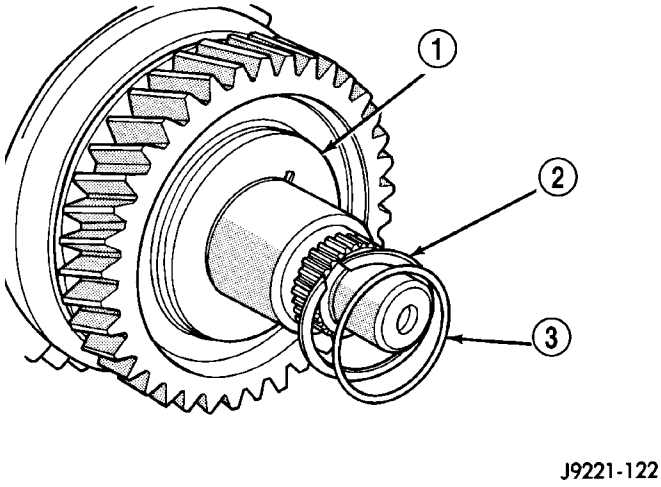

Fig. 93 SNAP RING AND THIRD

1 - SECOND GEAR THRUST WASHER
2 - THRUST WASHER SNAP RING
3 - THIRD GEAR BEARING SPACER

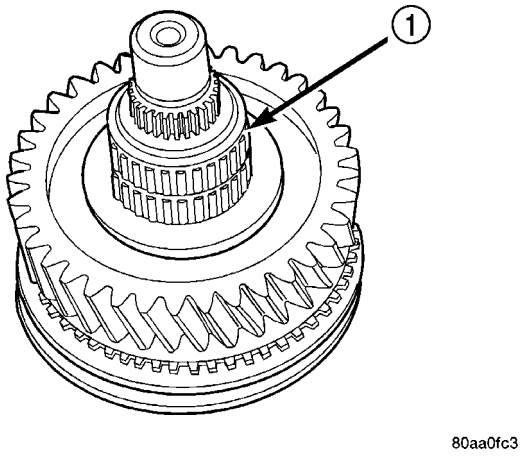

Fig. 94 THIRD GEAR BEARING

1 - THIRD GEAR BEARING

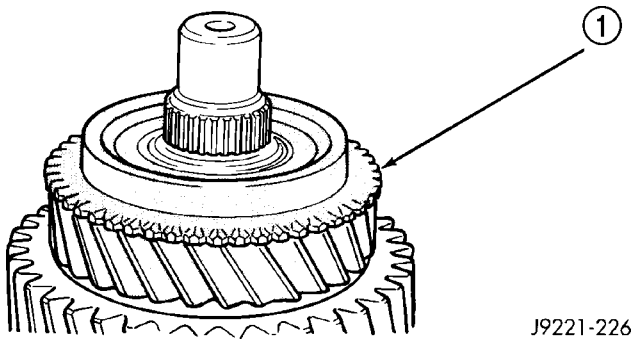

Fig. 95 THIRD GEAR

1 - THIRD GEAR

(20) Install synchro stop ring on third gear (Fig. 96). Verify stop ring is seated on cone taper.

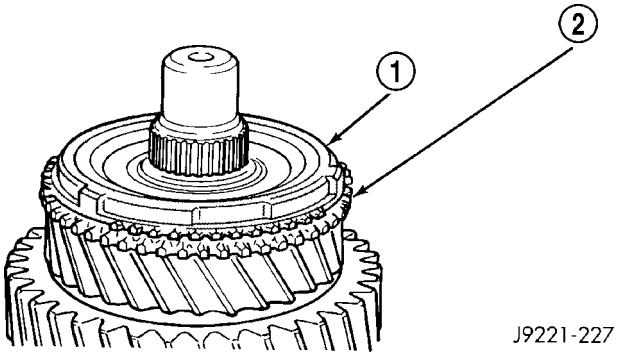

Fig. 96 THIRD GEAR STOP RING

1 - SYNCHRO STOP RING
2 - THIRD GEAR

(21) If 3-4 synchro was disassembled for service, reassemble synchro components as follows:

(a) Align and install synchro sleeve on hub (Fig. 97). **Front side of hub has a narrow groove machined in it.**

(b) Insert all three synchro struts in slots machined in sleeve and hub (Fig. 97).

(c) Install and seat synchro springs (Fig. 97). Use screwdriver to compress springs and seat them in struts and hub as shown.

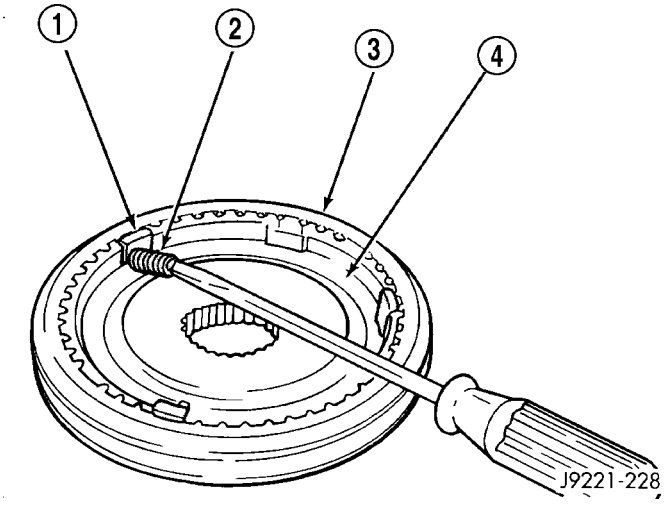

Fig. 97 SYNCHRO ASSEMBLY (3-4)

1 - STRUT (3)
2 - SPRING (3)
3 - 3-4 SLEEVE
4 - 3-4 HUB

(22) Start 3-4 synchro assembly on mainshaft with the hub groove and sleeve groove both facing forward. Tap assembly onto shaft splines until hub is about 3 mm (0.125 in.) away from third gear stop ring. Then align stop ring with synchro sleeve and hub and seat synchro assembly with Installer C-4040 (Fig. 98).

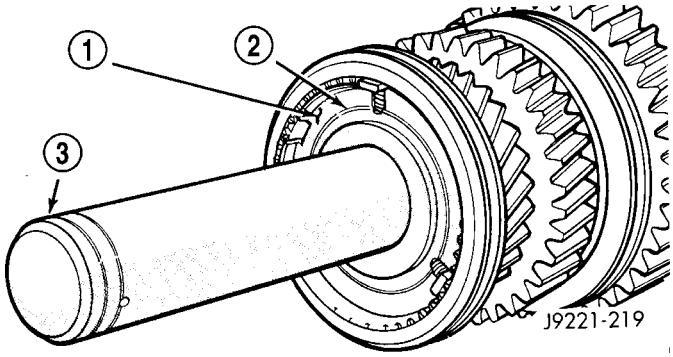

Fig. 98 SEATING 3-4 SYNCHRO ASSEMBLY ON MAINSHAFT

1 - 3-4 SYNCHRO HUB
2 - HUB GROOVE
3 - INSTALLER C-4040

(23) Verify 3-4 synchro hub is seated on shaft with approximately 3 mm (0.125 in.) of shaft spline visible.

NOTE: If hub is not seated, stop ring lugs are misaligned. Rotate ring until lugs are engaged in 3-4 hub slots.

(24) Verify that second and third gear rotate freely at this point. If not, determine the cause and correct.

(25) Invert mainshaft in case or bench.

(26) Install first gear bearing on mainshaft.

(27) Install first gear on shaft with clutch hub side of gear facing the front of shaft (Fig. 99). Verify tabs on clutch ring are aligned and seated in first gear hub.

NOTE: 1-2 synchro hub will not seat properly if clutch ring tabs are misaligned.

(28) Install reverse clutch gear on first gear (Fig. 99). Verify clutch gear is seated on shaft splines.

(29) Install reverse clutch gear snap ring with heavy duty snap ring pliers (Fig. 99). Verify snap ring is seated in groove.

NOTE: Reverse gear will not fit properly if snap ring is not seated.

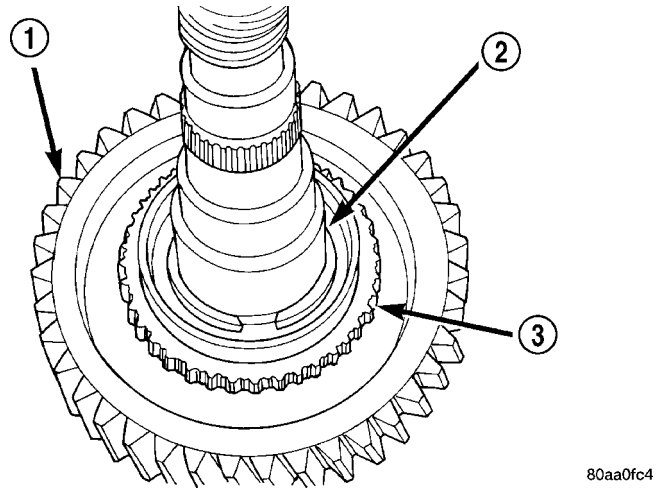

Fig. 99 FIRST GEAR AND CLUTCH GEAR

1 - FIRST GEAR
2 - REVERSE CLUTCH GEAR SNAP RING
3 - REVERSE CLUTCH GEAR

(30) Install stop ring on clutch cone (Fig. 100). Verify stop ring is seated on cone taper.

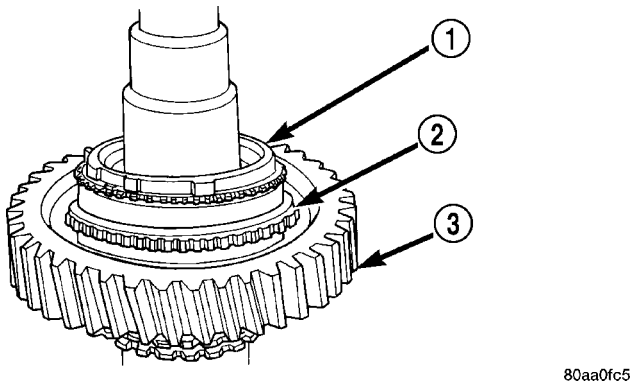

Fig. 100 CLUTCH GEAR STOP RING

1 - REVERSE GEAR STOP RING
2 - CLUTCH GEAR
3 - FIRST GEAR

(31) Install reverse gear bearing spacer on mainshaft and seat against reverse clutch gear snap ring (Fig. 101).

(32) Install reverse gear bearing on mainshaft (Fig. 101).

(33) If reverse gear sleeve and struts were disassembled for service, reassemble sleeve, struts and springs as follows:

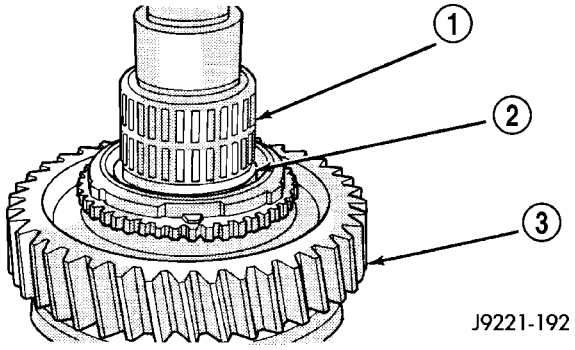

Fig. 101 REVERSE GEAR BEARING AND SPACER

1 - REVERSE GEAR BEARING
2 - BEARING SPACER
3 - FIRST GEAR

CAUTION: The reverse sleeve will fit either way on the hub. Verify tapered side of the sleeve faces rearward.

(a) Position sleeve on hub so tapered side of sleeve faces rearward. (Fig. 102).

(b) Rotate sleeve to align teeth on sleeve and hub. Sleeve will slide easily into place on hub when properly aligned.

(c) Install springs in gear hub (Fig. 102). Use petroleum jelly to hold springs in place if desired.

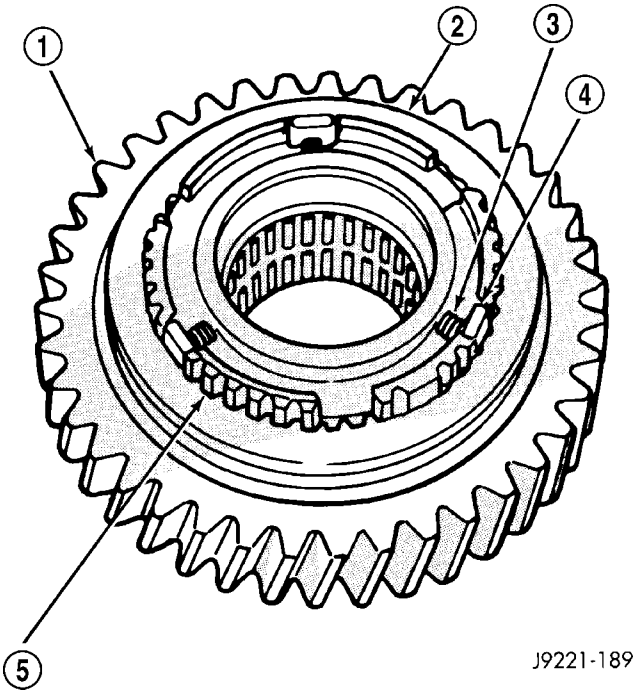

Fig. 102 REVERSE GEAR SYNCHRO ASSEMBLY

1 - REVERSE GEAR
2 - SLEEVE
3 - SPRING (3)
4 - STRUT (3)
5 - HUB

(d) Compress first spring with flat blade screwdriver and slide strut into position in hub slot. Then work spring into seat in strut with small hooked tool or screwdriver.

(e) Install second and third struts in same manner as described in step (d).

(f) Work sleeve upward on hub until struts are centered and seated in sleeve. Sleeve should be in neutral position after seating struts.

(34) Install reverse gear and synchro assembly on mainshaft (Fig. 103). Rotate assembly until stop ring lugs engage in hub slots and gear drops into seated position.

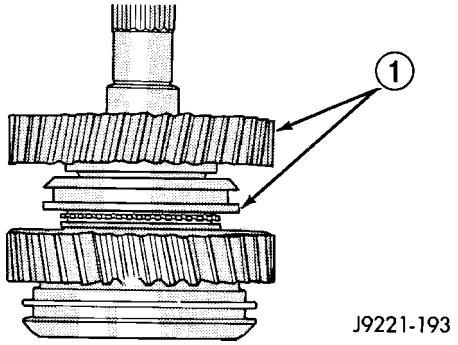

Fig. 103 REVERSE GEAR

1 - REVERSE GEAR AND SYNCHRO ASSEMBLY

(35) Install reverse gear thrust washer (Fig. 104).

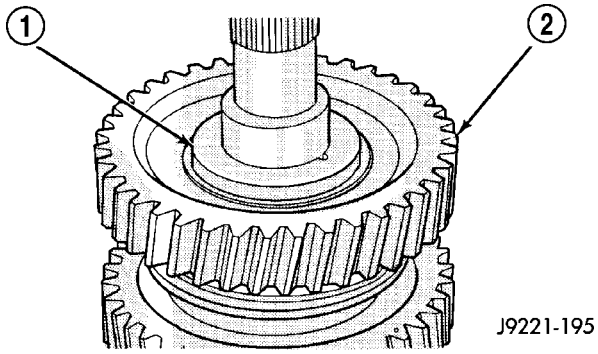

Fig. 104 REVERSE GEAR THRUST WASHER

1 - THRUST WASHER
2 - REVERSE GEAR

(36) Install rear bearing on mainshaft with Installer 6446. Seat bearing on output shaft and against thrust washer (Fig. 105).

(37) Install fourth gear stop ring in 3-4 synchro sleeve (Fig. 106).

(38) Install fourth gear clutch gear in stop ring (Fig. 107).

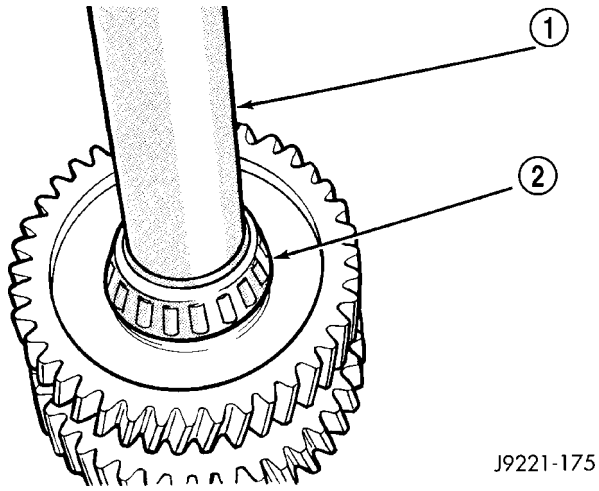

Fig. 105 MAINSHAFT REAR BEARING

1 - INSTALLER
2 - MAINSHAFT REAR BEARING

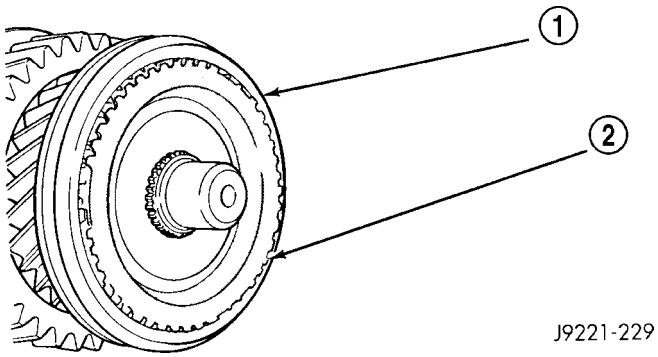

Fig. 106 FOURTH GEAR STOP RING

1 - 3-4 SYNCHRO SLEEVE
2 - FOURTH SPEED STOP RING

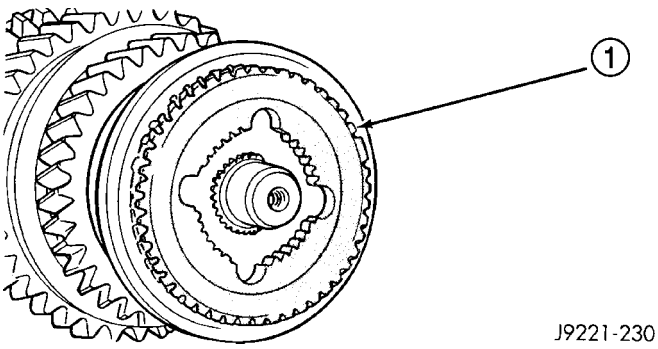

Fig. 107 FOURTH GEAR CLUTCH GEAR

1 - FOURTH SPEED CLUTCH GEAR

MANUAL TRANSMISSION - NV4500 (Continued)

(39) Roll gear case onto its left side.

(40) Grip mainshaft at pilot bearing hub and just behind reverse gear. Then lift assembly and guide rear of shaft through bearing bore at rear of case.

(41) Continue holding front of shaft but switch grip at rear to shaft output splines. Lift mainshaft assembly slightly, align gears and seat assembly in case.

(42) Set transmission case upright (Fig. 108).

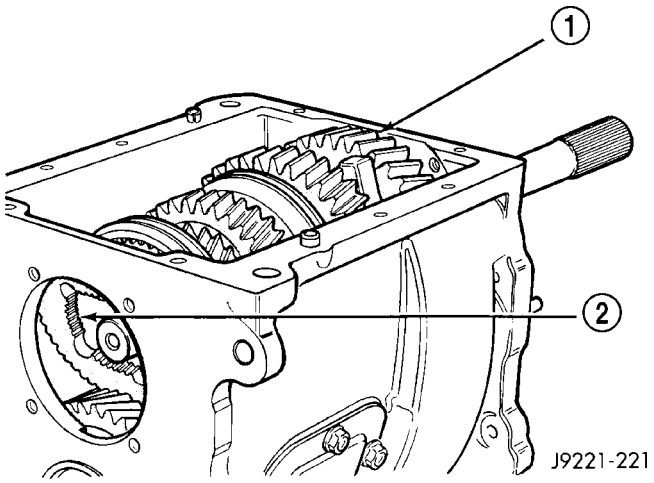

Fig. 108 MAINSHAFT AND GEARTRAIN IN CASE

1 - MAINSHAFT AND GEARTRAIN
2 - FOURTH SPEED CLUTCH GEAR

(43) Install drive gear thrust bearing on mainshaft (Fig. 109). Use plenty of petroleum jelly to hold bearing in place.

(44) Check alignment and mesh of mainshaft gears. If gears are not aligned, roll case on side and realign shaft and gears in case.

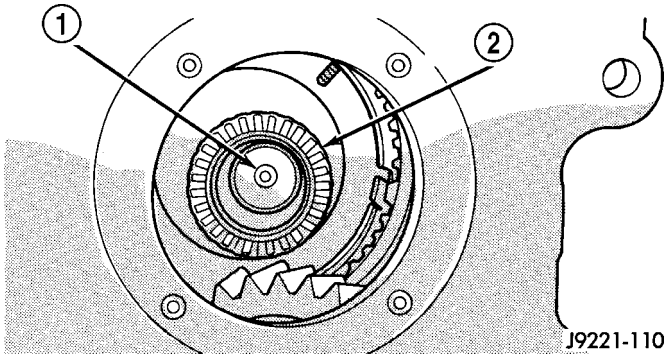

Fig. 109 DRIVE GEAR THRUST BEARING

1 - MAINSHAFT
2 - DRIVE GEAR THRUST BEARING

DRIVE GEAR AND RETAINER

(1) Install bearing on drive gear with Installer 6448 (Fig. 110).

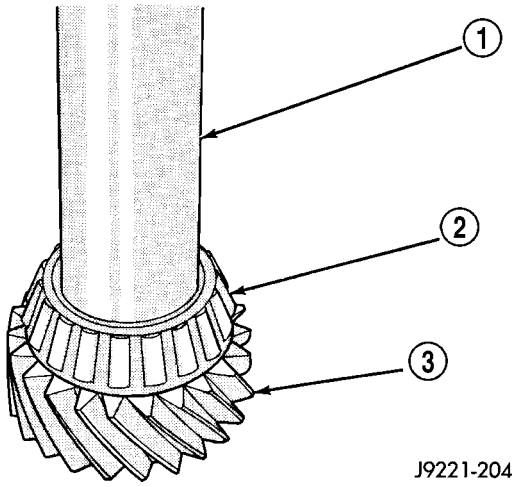

Fig. 110 FRONT BEARING ON DRIVE GEAR

1 - INSTALLER
2 - BEARING
3 - DRIVE GEAR

(2) Lubricate pilot bearing with petroleum jelly and install it in drive gear bore.

(3) Install drive gear on mainshaft. Work gear rearward until mainshaft hub is seated in pilot bearing.

(4) Install bearing cup in front retainer with Handle C-4171 and Installer C-4308 (Fig. 111).

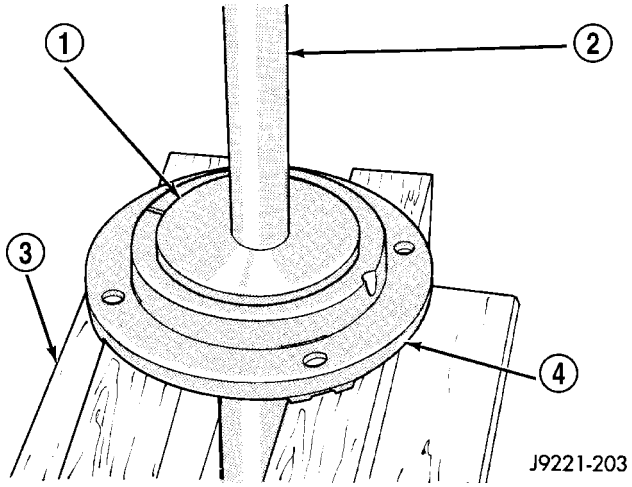

Fig. 111 FRONT BEARING CUP IN RETAINER

1 - INSTALLER
2 - HANDLE
3 - WOOD BLOCKS
4 - RETAINER

MANUAL TRANSMISSION - NV4500 (Continued)

(5) Install new oil seal in front bearing retainer with Installer 6052 (Fig. 112). Use one or two wood blocks to support retainer as shown. Lubricate seal lip with petroleum jelly after installation.

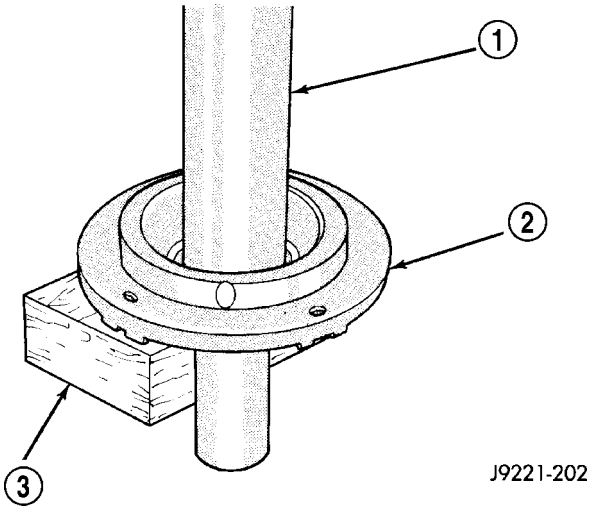

Fig. 112 BEARING RETAINER OIL SEAL

1 - INSTALLER
2 - RETAINER
3 - WOOD BLOCK

(6) Clean contact surfaces of gear case and front bearing retainer with a wax and grease remover.

(7) Apply Mopar Silicone Sealer or equivalent to flange surface of front bearing retainer (Fig. 113).

(8) Install front bearing retainer over drive gear and start it into case.

(9) Start front bearing retainer in gear case. Verify retainer lube channel is at the top-center **(12 O'clock)** position (Fig. 113).

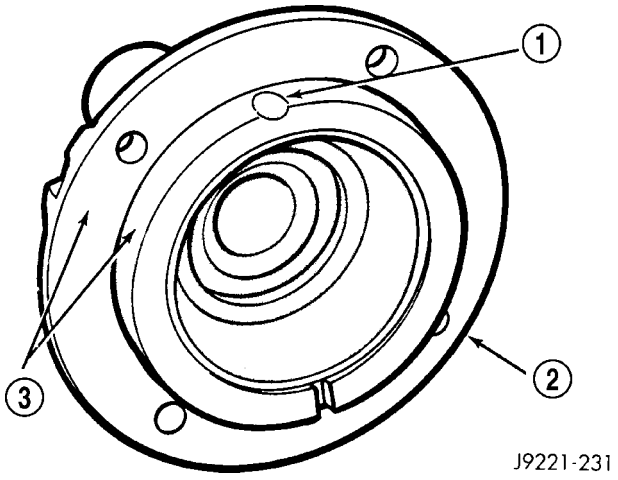

Fig. 113 LOCATION OF FRONT RETAINER LUBE CHANNEL

1 - LUBE CHANNEL
2 - FRONT RETAINER
3 - APPLY GASKET MAKER HERE

(10) Align front bearing retainer bolt holes and tap retainer into place with plastic mallet. Install **new** retainer bolts and tighten to 30 N·m (22 ft. lbs.) (Fig. 114).

NOTE: Never reuse the old bolts.

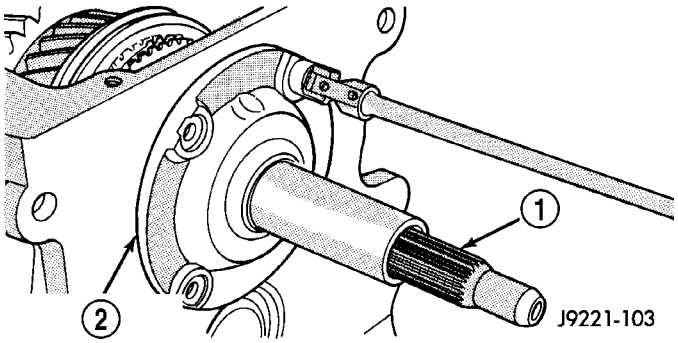

Fig. 114 FRONT BEARING RETAINER

1 - DRIVE GEAR
2 - FRONT BEARING RETAINER

MAINSHAFT END PLAY

(1) Install mainshaft rear bearing cup in case and over bearing. Tap bearing cup into place with plastic mallet.

(2) Install rear bearing plate to hold mainshaft and rear bearing in position (Fig. 115).

NOTE: Do not install any end play shims at this time.

(3) Tighten rear bearing plate bolts securely.

(4) Place gear case in upright position on bench. Either cut hole in bench to accept drive gear and front retainer or use C-clamps to secure transmission on bench.

NOTE: Do not leave transmission unsupported.

(5) Install Extension Rod 8161 into a suitable threaded hole in rear of case.

(6) Mount dial indicator on extension rod and position indicator plunger against end of mainshaft.

(7) Move mainshaft forward to remove all play then zero dial indicator.

(8) Move mainshaft upward and record dial indicator reading. Move mainshaft with pry tool positioned between drive gear and case.

(9) End play should be 0.051-0.15 mm (0.002-0.006 in.). Select fit shims are available to adjust end play. If end play adjustment is required, remove bearing plate and install necessary shim.

(10) Reinstall rear bearing plate with oil hole in bearing plate at the top (Fig. 115).

(11) Apply Mopar Lock N' Seal or equivalent to bearing plate bolt threads. Install and tighten bolts to 23 N·m (200 in. lbs.).

MANUAL TRANSMISSION - NV4500 (Continued)

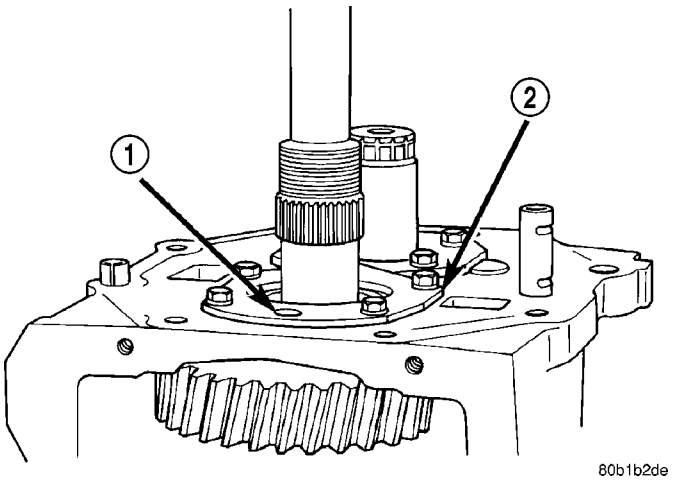

Fig. 115 REAR BEARING PLATE

1 - BEARING PLATE OIL HOLE (AT TOP)
2 - MAINSHAFT REAR BEARING PLATE

(12) Install mainshaft fifth gear with Installer 6446 (Fig. 116). Gear is seated when it contacts rear bearing.

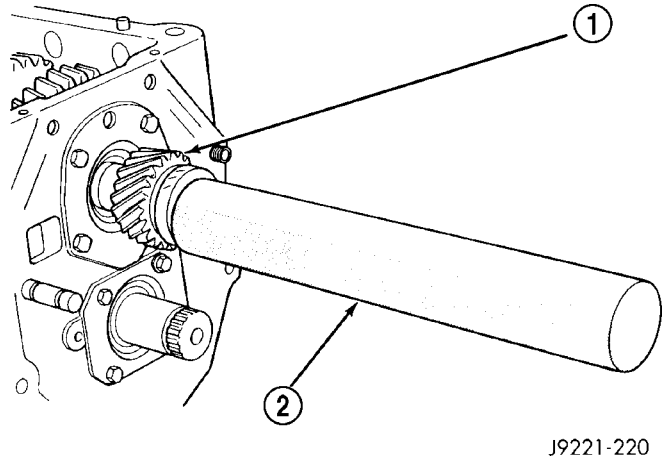

Fig. 116 MAINSHAFT FIFTH GEAR

1 - MAINSHAFT FIFTH GEAR
2 - INSTALLER

COUNTERSHAFT FIFTH GEAR SYNCHRO

(1) Install thrust washer pin in countershaft (Fig. 117).

(2) Install thrust washer on countershaft. Turn washer until pin engages in washer notch (Fig. 118).

NOTE: The flat side of washer faces the rear and cone side faces the front.

(3) Lubricate and install fifth gear bearing on countershaft (Fig. 119).

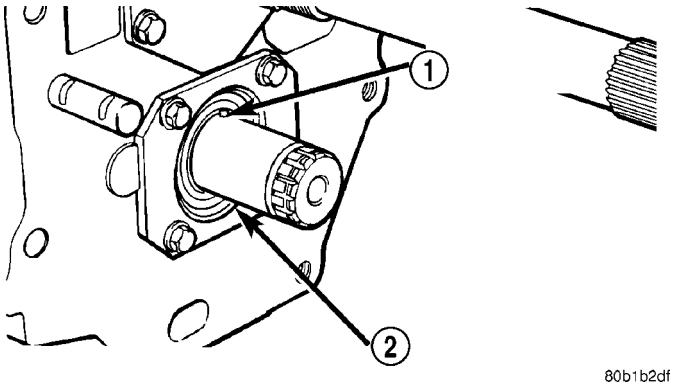

Fig. 117 FIFTH GEAR THRUST WASHER PIN

1 - THRUST WASHER PIN
2 - COUNTERSHAFT

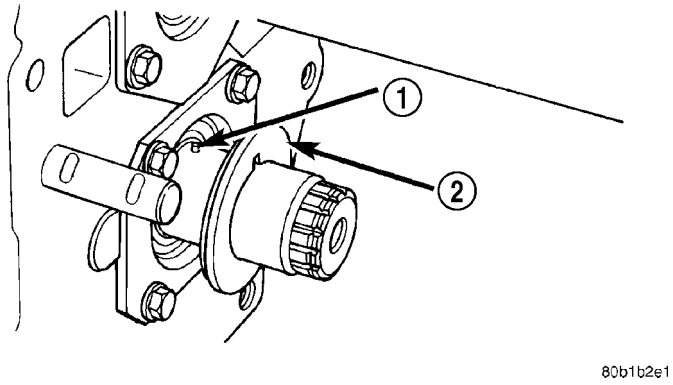

Fig. 118 FIFTH GEAR THRUST WASHER

1 - PIN
2 - THRUST WASHER

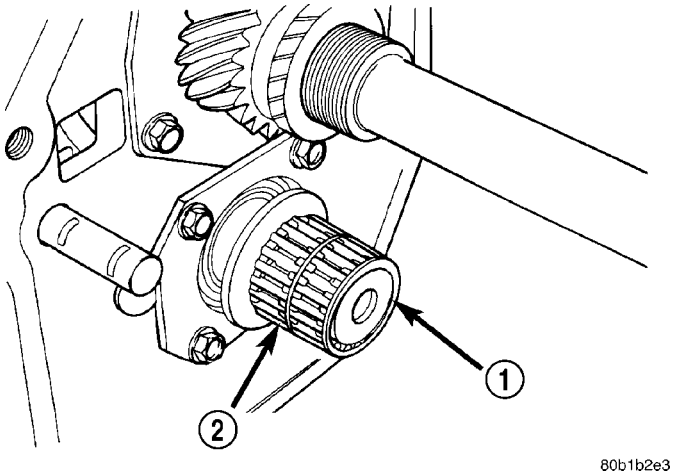

Fig. 119 COUNTERSHAFT FIFTH GEAR BEARING

1 - COUNTERSHAFT
2 - FIFTH GEAR NEEDLE BEARING

(4) Install synchro sleeve on hub of countershaft fifth gear with tapered side of sleeve facing front and the flat side facing rear (Fig. 120).

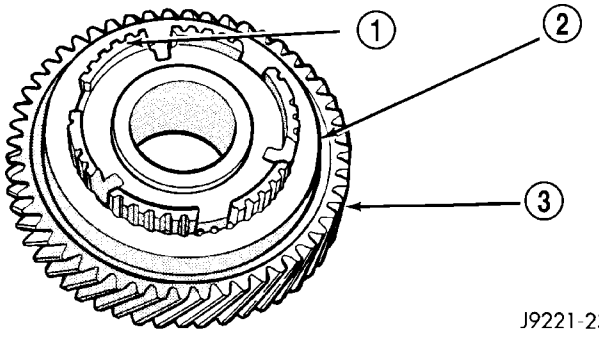

Fig. 120 SYNCHRO SLEEVE ON COUNTERSHAFT FIFTH

1 - GEAR HUB
2 - SYNCHRO SLEEVE
3 - COUNTERSHAFT FIFTH GEAR

(5) Install shift fork in synchro sleeve (Fig. 121).

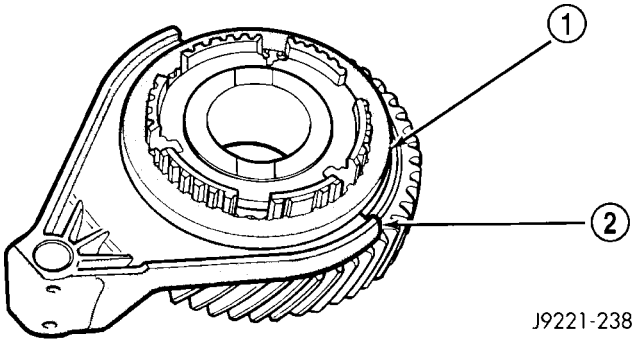

Fig. 121 FIFTH GEAR SHIFT FORK IN SYNCHRO SLEEVE

1 - SYNCHRO SLEEVE
2 - SHIFT FORK

(6) Install assembled fifth gear, synchro sleeve and shift fork (Fig. 122). Align fork with shift lug rail and align gear with bearings and countershaft. Start components onto shaft and rail, then tap gear and fork into place with plastic or rawhide mallet.

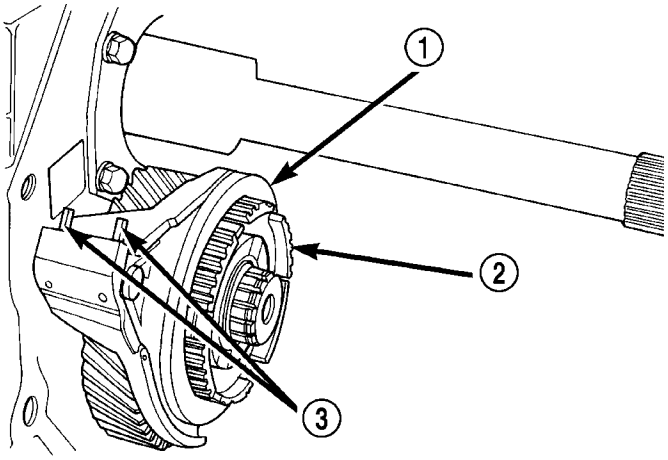

Fig. 122 COUNTERSHAFT FIFTH GEAR, SHIFT FORK AND SYNCHRO SLEEVE

1 - SHIFT FORK AND SLEEVE
2 - FIFTH GEAR HUB
3 - SHIFT FORK ROLL PINS

(7) Install fifth gear synchro struts and springs (Fig. 123).
